

CITY OF ATLANTA DEPT. OF PUBLIC WORKS

COMMUNICATIONS AND DETECTION PLAN ALONG NORTH AVE.

LOCATION SKETCH

INTERSECTION #1
North Ave @ Argonne Ave

INTERSECTION #6
Ponce de Leon Ave @ Boulevard

INTERSECTION #5
North Ave @ Glen Iris Dr

INTERSECTION #2
North Ave @ Hunt Rd

INTERSECTION #4
North Ave @ Boulevard

INTERSECTION #3
North Ave @ Parkway Dr

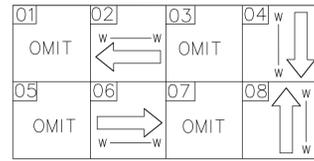

NOTE:
AS PER THE CITY OF ATLANTA, NO SURVEY WAS DONE WITHIN THE BOUNDARIES OF THIS PROJECT. ALL TOPOGRAPHICAL INFORMATION DEPICTED IN THESE PLANS WAS DEVELOPED FROM AERIAL PHOTOGRAPHY AND GIS. THEREFORE, IT IS THE CONTRACTORS RESPONSIBILITY TO VERIFY ALL UTILITIES (HORIZONTAL AND VERTICAL), PROPERTY LINES, AND RIGHT OF WAY. THE ATTENTION OF THE BIDDER IS DIRECTED SPECIFICALLY TO SUBSECTIONS 102.04, 102.05, AND 104.03 OF THE GDOT SPECIFICATIONS. ALL DEVICES, EQUIPMENT, AND MATERIALS INSTALLED SHALL BE INSTALLED WITHIN THE EXISTING RIGHT OF WAY.

PROJECT:CSSTP-0010-00(883)

P.I. NO.:0010883

Section 687 - Traffic Signal Timing

Add the following:

687.1 General Description

Develop and implement, by a prequalified Contractor/Consultant, a traffic signal operating plan that provides safe and efficient operation of the Intersections defined in Table 687-4. As a MINIMUM, this work will include:

- Coordinate with local GDOT District and/or local government(s) to gather agency preferred timing parameters and expectations, and to facilitate a smooth transition from existing signal timing plans to new signal timing plans.
- Evaluation of existing traffic operations, system equipment functionality, and inventory of assets.
- Collect two-hour turning movement counts (TMC's) for the AM, mid-day, and PM peak periods at each Intersection. For contractor timing projects (if approved by the Engineer AND the signals reside in a rural area), one-hour TMC's may be collected in lieu of two-hour TMC's.
- Collect directional (tube) counts (7-day/24-hour) per control section, as appropriate or as recommended by the Engineer. A minimum of one (1) directional count is required and additional directional counts are needed if the number of intersections exceeds seven (7) or if there are significant changes in traffic volumes along the corridor.
- Develop, implement and fine-tune a minimum of four (4) signal timing plans per control section, unless otherwise specified by the Engineer. In most cases, more than the minimum required will be needed to successfully complete the project.
- Develop additional timing plans as needed, including holiday, seasonal, weekend and other special plans as requested by the Engineer. The number of additional plans shall be discussed as part of the kickoff meeting. For contractor timing projects, the Consultant will need to address this item prior to providing a fee to the contractor(s).
- Conduct before/after studies and prepare project performance measures to detail signal timing improvements.

687.1.01 Definitions

Use the following definitions for purposes of this section:

- **Prequalified Contractor/Consultant:** One who is qualified to perform work in Area Class Codes 3.06, 3.07, and 3.09 in the Department's Consultant Prequalification regulations.
- **Signal Timing Plan:** A unique combination of cycle length/split/offset for all Intersections within a system or control section.
- **Control Section:** Any portion of a traffic control system, which can be controlled by a single set of timing parameters and in which all Intersections change timing patterns at the same time.
- **Engineer:** The State Signal Timing Engineer or District Traffic Engineer for the District in which the Intersections are located.

- **Intersections:** All the Intersections listed in Table 687-4. In the event there are no Intersections listed, the Contractor/Consultant shall request the list of Intersections to be re-timed from the maintaining agency.
- **Directional (tube) Count:** The measurement of the total traffic volume traveling a roadway in a single direction.
- **Turning Movement Count (TMC):** The measurement of the directional traffic volume traveling through an individual Intersection.
- **Before/After Study:** The measurement of the travel time, stops, and emissions through a control section and the comparison of the before versus after data. “Before” data is gathered prior to making any changes. “After” data is gathered once the new timing plans are implemented, fine-tuned and accepted by the Engineer.
- **Approved or Approval:** Written notice (via letter, memorandum or email) from the Engineer or his designated representative.

687.1.02 Related References

A. Standard Specifications

Section 108 – Prosecution and Progress

Section 647 – Traffic Signal Installation

Section 925 – Traffic Signal Equipment

687.1.03 Submittals

In the sequence and order listed, submit one (1) electronic (.PDF) copy to the Engineer for review and approval. Approval of each submittal must be obtained before conducting work on subsequent submittals. *Hard copies of any/all reports may be requested by the Engineer and/or maintaining agency.*

1. Kickoff Meeting
2. Preliminary Timing Report
3. Final Timing Report
4. Project Closeout

Note: Signal timing performed as part of a GDOT construction project should be submitted to the signal contractor for submission to the Engineer. This will ensure the project inspector from the respective GDOT area office, or from the consulting firm performing project inspections for GDOT, is knowledgeable for purposes of payment requests.

See Table 687-3 for workflow chart.

687.2 Materials

687.2.01 Software

The Department will not provide resources to fulfill any Contractor obligations under this Special Provision. The Department will not furnish any software or equipment for the development and implementation of timing plans. Obtain all necessary licensed software, equipment and materials to support this work effort.

687.3 Construction Requirements

687.3.01 Kickoff Meeting

A kickoff meeting, in person or via conference call (however preferred by the Engineer), with the Engineer and any other parties involved in the timings will be conducted to determine locations to collect Directional Counts, time of day to collect TMC’s, travel run routes, local jurisdiction timing preferences, project schedule, whether or not to develop traffic responsive timing plans, and overall project expectations.

After the meeting is complete, an email submission of the meeting minutes shall be sent to all parties involved for verification of project decisions. A project schedule and graphic depicting approved locations for TMCs and Directional Counts should also be submitted as part of the meeting minutes. An example of a system map with count locations is shown in Exhibit 687-3.

At this time, “Before” travel time runs should be collected per the route(s) agreed upon at the Kickoff Meeting. TMC’s and Directional Counts should also be collected as agreed upon in the Kickoff Meeting.

687.3.02 Preliminary Timing Report

Visit all Intersections listed in Table 687-4 during the AM, MD and PM peak traffic periods (weekends may also be required) in order to make qualitative assessments of Intersection operation. Make note of queue length, delays, conflicts or any other operational characteristics that should be considered in evaluating and developing coordinated traffic signal timing plans. Make note of the surrounding land use and traffic generators to gain insight on the daily traffic patterns of motorists in the area.

Develop a traffic signal Preliminary Timing Report containing, but not limited to the following data:

1. Intersection Inventory
2. Clearance Calculations
3. Methodology for Evaluating Performance Measures
4. Existing System Evaluation and Operational Analysis
5. Traffic Count Data in Summarized Form
6. Raw Count Data
7. Proposed Time of Day Plans and Comparison to Existing
8. Modeling Analysis and Proposed Improvements

687.3.02.01 Intersection Inventory

Prepare an inventory of the conditions at each Intersection and collect all data required to effectively devise a signal timing plan for the Intersections. Inventory the Intersection configuration, signing and marking, marked and unmarked crosswalk distances, turn lane storage lengths, signal phasing and signal timing at all Intersections as well as any other data required to complete the system timing plans. The minimum limits of this inventory include the vehicle detection locations. The purpose of the inventory is for the preparation of signal timing plans, signal system database and system maps. An example of an Intersection Inventory Sheet is shown in Exhibit 687-1. An example of an Intersection Diagram is shown in Exhibit 687-2. For Intersections with new construction, a copy of the project construction plan sheet is acceptable.

All (cabinet, controller, conflict monitor, battery backup, vehicular and pedestrian signals, communications equipment, signs, etc.) equipment must be inventoried and logged into the current version of the GDOT Signal Inventory Database. An example of the data collected is shown in Exhibit 687-2.

687.3.02.02 Clearance Calculations

Calculation of Pedestrian and Vehicular Clearance Values should follow the MUTCD guidelines, unless the local jurisdiction has its own standard for calculating clearances. The clearance time consists of the yellow change interval and the all-red clearance interval that separates phases. Tables 687-1 and 687-2 should be utilized to calculate vehicular clearance intervals.

The intersection diagrams shall detail where the measurements for both vehicular and pedestrian clearance values were taken.

Yellow Clearance Interval: The length of time such that the distance traveled at the 85th percentile speed in that length of time is equal to the distance required to stop from the 85th percentile speed. It is calculated using the “ITE Formula” where:

$$Y = t + v/(2a + 2Gg)$$

Where:

Y = yellow change interval (seconds)

t = perception – reaction time (seconds) (assume 1 second)

v = design velocity (feet/sec)

a = deceleration rate (feet/sec.²) (assume 10 ft/sec²)

G = acceleration due to gravity (32.2 ft/sec²)

g = grade in decimal form (1 percent = 0.01) {Round UP to nearest grade}

Table 687-1 Yellow Clearance Time (Y) Chart (Seconds)

		GRADE (PERCENT)										
		5	4	3	2	1	0	-1	-2	-3	-4	-5
SPEED (MPH)	25	3.0	3.0	3.0	3.0	3.0	3.0	3.0	3.0	3.0	3.1	3.2
	30	3.0	3.0	3.0	3.1	3.1	3.2	3.3	3.4	3.4	3.5	3.6
	35	3.2	3.3	3.3	3.4	3.5	3.6	3.7	3.7	3.8	4.0	4.1
	40	3.5	3.6	3.7	3.8	3.8	3.9	4.0	4.1	4.3	4.4	4.5
	45	3.8	3.9	4.0	4.1	4.2	4.3	4.4	4.5	4.7	4.8	4.9
	50	4.2	4.3	4.4	4.5	4.6	4.7	4.8	4.9	5.1	5.2	5.4
	55	4.5	4.6	4.7	4.8	4.9	5.0	5.2	5.3	5.5	5.6	5.8
	60	4.8	4.9	5.0	5.1	5.3	5.4	5.6	5.7	5.9	*	*
	65	5.1	5.2	5.4	5.5	5.6	5.8	5.9	*	*	*	*
	70	5.4	5.6	5.7	5.8	6.0	*	*	*	*	*	*

*Minimum Yellow Clearance Time should be 3.0 seconds. If the calculated yellow clearance time is greater than 6.0 seconds, consult with the Engineer.

All-red Clearance Interval: The length of time needed to clear the intersection based on the vehicle speed. It is calculated using the “ITE Formula” where:

$$R = (w + l)/v$$

Where:

R = All-red Clearance Time (seconds)

w = width of the intersection, stop bar to opposite curb (or crosswalk when the crosswalk is greater than 20' from the intersection) {feet}
 {Round UP to nearest standard width}

l = length of vehicle (assume 20 feet)

v = design velocity (feet/sec)

Table 687-2 All-red Clearance Time (R) Chart (Seconds)

		WIDTH OF INTERSECTION (FEET)										
		40	50	60	70	80	90	100	110	120	130	140
SPEED (MPH)	25	1.6	1.9	2.2	2.4	2.7	3.0	*	*	*	*	*
	30	1.5	1.6	1.8	2.0	2.3	2.5	2.7	2.9	*	*	*
	35	1.5	1.5	1.6	1.7	1.9	2.1	2.3	2.5	2.7	2.9	*
	40	1.5	1.5	1.5	1.5	1.7	1.9	2.0	2.2	2.4	2.6	2.7
	45	1.5	1.5	1.5	1.5	1.5	1.7	1.8	2.0	2.1	2.3	2.4
	50	1.5	1.5	1.5	1.5	1.5	1.5	1.6	1.8	1.9	2.0	2.2
	55	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.6	1.7	1.9	2.0
	60	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.6	1.7	1.8
	65	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.6	1.7
	70	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.5	1.6

*All-red Clearance Time should be a minimum of 1.5 seconds. If the calculated red time is greater than 3.0 seconds, the additional time should be added to the Yellow Clearance Time, clearly documented as such, and discussed with the Engineer.

687.3.02.03 Methodology for Evaluating Performance Measures

An explanation of the travel run methodology and the software being used to conduct the travel runs will be included as part of this report. Also, once the travel runs are complete, explain the procedure for studying the “Before” and the “After” data to show project costs and benefits. Additional performance measures (for example, arrival rate on green) and analysis methodology should be detailed at this time.

687.3.02.04 Existing System Evaluation and Operational Analysis

An evaluation of current system conditions shall be included in the Preliminary Timing Report. Detail about directionality, queues, existing levels of service, and traffic generators are expected. Demonstrate the current operational characteristics of the system using field collected data and the modeling software approved at the kickoff meeting.

“Before” Travel Runs should be conducted at this time.

687.3.02.05 Traffic Count Data in Summarized Form

After the directional count locations have been approved (in the kickoff meeting), conduct the directional counts. In general, directional counts should be taken along major arterials and may be taken on major side streets if needed. Take directional counts for seven (7) consecutive days, twenty-four (24) hours per day. Use an automatic traffic counter that produces a written record of the count and time of day. Summarize the directional count data on a volume summary form. From the count data, develop a tabular and graphic presentation of directional traffic volumes showing 15-minute interval volumes and hourly interval volumes over the seven consecutive day period. An example of tabular 15-minute interval volumes are show in Exhibit 687-6 and an example of graphical hourly interval volumes is shown in Exhibit 687-7.

After the TMC locations and time periods have been approved (in the kickoff meeting), conduct the TMC’s. Summarize peak hour turning movement counts in fifteen (15) minute increments for one-hour intervals. Differentiate in the turning movement counts between trucks and passenger vehicles, and include pedestrian counts. Summarize the count data on turning movement count forms. An example of turning movement count forms is shown in Exhibit 687-8.

Turning Movement Count Data should also be provided at this time in a summarized form, such as an intersection schematic detailing turning movement counts at intersections where data has been collected.

687.3.02.06 Raw Count Data

Provide all raw count data as collected for the project. This may be included as an appendix item to this report.

687.3.02.07 Proposed Time of Day Plans and Comparison to Existing

Describe how the proposed timing plans and TOD compare to the existing system operation. An example of a timing plan and TOD comparison is shown in Exhibit 687-9.

Proposed Timing Plans shall be listed and described individually detailing traffic conditions while the plan is running and what the plan is attempting to achieve. An operational analysis shall be included that details the existing operation and how the proposed timing plans will improve the performance of the signal system. The modeling software files shall also be submitted for review.

687.3.02.08 Modeling Analysis and Proposed Improvements

Develop software models of the proposed timing plans with approved software by the Department. Evaluate each proposed timing plan with the modeling software based on proposed performance measures. Summarize the proposed improvements in tabular or graphical form, clearly demonstrating the before conditions of the project and the proposed after conditions as reported through software modeling. This can be done through approved performance measures, such as Level of Service (LOS), queue analysis, number of stops reduction, overall delay reduction, travel time reduction, emissions reductions, arrival rate on greens, and any other industry accepted metric.

Submit one (1) electronic (.PDF) copy of the Preliminary Timing Report to the Engineer for review and approval. Obtain written approval of the Preliminary Timing Plan Report prior to implementation.

687.3.03 Timing Plan Implementation and Fine Tuning

687.3.03.01 Database Development and Testing

Determine values for all controller parameters (local and coordination) and prepare the system database for the Intersections listed in Table 687-4. Include the entire database for the local and master controllers, as well as central server settings.

Each of the proposed timing plans shall be tested prior to field implementation. Testing results shall be documented and included as part of the Preliminary Timing Report. An example of office testing documentation is shown in Exhibit 687-11.

687.3.03.02 Field Implementation

Upon receipt of written approval of the Preliminary Timing Report by the Engineer, implement the new signal and system timing data for the entire system. Upon approval, Contractor/Consultant shall notify the Engineer at least three (3) working days in advance of the implementation of the system timing plans. Do not schedule implementation on peak traffic days or peak travel times without prior approval from the Engineer. At this stage, if one isn't found in the cabinet, a data key shall be supplied by GDOT or the local jurisdiction and kept inside the cabinet drawer with current timing data. Data keys should be labeled with the applicable controller firmware version and date.

Enter only approved data into the equipment at each location. If an Intersection is ready for turn-on before the initial timing plans are developed, the existing timings (if suitable) or other approved temporary timings may be installed until the initial timing plans are developed. Do not activate any new phases under temporary timings without the approval of the Engineer. Enter the new timing data at each controller, through a master controller, or from a central workstation. If entering the timing data from a central workstation, have a person experienced with controller operation on-site in the field during the implementation process. Obtain approval of the method of data entry from the Engineer prior to the entry of any data. Develop and implement all settings required for the system database. Conduct initial field verifications at time of implementation. Review the operation of equipment in the field to verify that the correct cycle lengths, splits, offsets and phasing sequence are being implemented and that no major operation problems occur. Field testing documentation should be submitted to the Engineer after implementation. An example of field testing documentation is shown in Exhibit 687-12.

Review the timing plans and adjust this data as required by actual field conditions or as directed by the Engineer. Update the data key with the current timing as changes are made.

687.3.03.03 Field Fine Tuning

Fine-tuning consists of an on-street review of the timing plans by the Contractor/Consultant. All timing plans should be verified based on traffic conditions at the time the plan is running in the TOD schedule. Cycle lengths, splits and offset should be field verified based on traffic conditions by the Consultant/Contractor. All adjustments to the timing plans should be uploaded to the final database and the local Intersection data key.

Fine-tuning approval consists of an on-street review (system evaluation) of the timing plans by the Contractor/Consultant, the Department and the Local Agency, if applicable. A written request (via email) is to be sent to the Engineer, the Department and the Local Jurisdiction for the system evaluation at least five (5) working days in advance of the proposed date for the review. It is not the intent of the approval for the Department and the Local Agency to accomplish fine-tuning for the Contractor/Consultant. System evaluations are reserved for the Department and/or Local Agency to review and approve, reject or request changes to the final timings, as installed by the Contractor/Consultant. As directed by the Department, the system evaluation could involve rejection of the timing plans, at which point the Contractor/Consultant must repeat the fine-tuning process and then request a follow-up approval with the Department. If so directed, implement the necessary adjustments and repeat the detailed on-street review. The Department reserves the right to require that adjustments be made due to conditions observed in the field.

Make any adjustments to the timings requested by the Department/Local until the Final Timing Report is submitted for review. Anticipate implementing all plans into the system and fine tuning all plans during the TOD/day-of-week (and season of year, if applicable) that the plans are scheduled to be in effect. Present to the Department for approval any contract scheduling conflicts that may interfere with the proper scheduling of the timing plan implementation along with proposed resolutions.

Perform "After" travel runs upon approval of new timing plans.

687.3.04 Final Timing Report

687.3.04.01 Project Performance Measures – Before/After Analysis

After all necessary field adjustments have been made to the timing and approval of the operation is provided by the Engineer, provide a qualitative assessment of the signal system timing by comparing the “Before” travel time runs with the “After” travel time runs. A Cost/Benefit analysis shall be included as part of the signal timing assessment. *If travel runs are removed from scope at the Kickoff Meeting, the Final Timing Report will consist of the final timing database printouts.*

Develop project performance measures containing, but not limited to the following data:

- Emissions (NOx, CO, VOC)
- Total travel time (Before and After)
- Stops/Delays (including side streets)
- Fuel consumption
- Benefit/Cost Ratio
- Additional Measures of Effectiveness as directed by the Engineer

Submit a copy of the final local and system timing plans to the Engineer. Use the back-up routine provided in the Department’s signal system software to make a back-up of the system database. Supply this back-up electronic version to the Engineer (Include updated and final signal timing software models and any/all electronic database). Leave the data key in the cabinet drawer. Data keys should be labeled with the applicable controller firmware version and date.

687.3.04.02 As-Built Timing Database

Provide a final timing database that includes all changes made from field fine tuning.

687.3.04.03 As-Built Software Model

Provide a final software model that includes all changes made from field fine tuning.

687.3.04.04 Data Keys/Loadable Media

Provide data keys or other loadable media as approved by the Engineer for each intersection in the project.

Submit one (1) electronic (.PDF) copy of the Final Timing Report to the Engineer for review and approval. Obtain written approval of the Final Timing Report prior to submitting all approved project files to the Engineer.

687.3.05 Training

687.3.05.01 Overview

Training may be requested by the Engineer, Department or Local Jurisdiction.

Provide instructors and all material for training Department and Local Agency personnel in the development and implementation of timing plans specifically related to this project. Submit training course outline to the Engineer for approval at least thirty (30) days prior to the proposed scheduled start of the training session. Obtain written approval of the course content prior to the final scheduling of the training session. Scheduling of training shall be coordinated with the Department and Local agency.

Develop and supply all necessary manuals, displays, class notes, visual aids, and/or other instructional materials as required to provide the training programs described herein. Bind the manuals individually in loose-leaf binders and provide up to ten (10) copies depending on the requested size of the class. Check with the Engineer to determine the final number of required manuals.

Unless otherwise specified, conduct the training session at the District office. Provide up to sixteen (16) hours of training over multiple days. Training could consist of both classroom and field sessions. The dates and times of the training will be approved by the Engineer. The Engineer will determine the personnel who will attend each training session.

687.3.05.02 Recommended Content

Provide a course to instruct the procuring and maintaining agency in the procedures used in the development and implementation of timing plans for this project.

Items to *possibly* be covered:

- Data required for input into the signal timing program and what the signal timing program does with the data
- Program limitations
- Timing plan methodology for the respective project
- Explanation of timing plan development process related to the signal timing program
- Terminology employed, data required, reports and graphics available for evaluation, definition of MOE's, interpretation of results
- Explanation of timing plan development process related to the respective project
- Reasoning for the evaluation and selection of cycle length, splits and offsets and why this is an iterative process
- Conversion of the timing plan output from the signal timing program to the input utilized by the system and controller database
- Installation of the timing plans for manual mode use and TOD use
- Fine-tuning a signal system
- Fine-tuning intersections with light vehicular traffic but high pedestrian demand
- Development of parameters to be used in the database to implement traffic responsive operation based on the data collected from the field
- Data collection to support traffic responsive operation
- Fine-tuning traffic responsive operation
- Reporting project performance measures
- Conducting a Benefit to Cost (B/C) analysis

687.4 Measurement

687.4.01 Construction Contracts

GDOT will provide one (1) data key or other media per controller, as noted in section 687.3.04 Final Timing Report, if one is not currently in the cabinet. The data key shall remain with maintaining local agencies. Consultant shall update data key with current timing plan(s).

Traffic signal timing, complete and accepted is measured for payment per Lump Sum.

- Traffic Signal Timing
- Training

687.5 Payment

687.5.01 Construction Contracts

Traffic signal timing complete and accepted is measured for payment per Lump Sum. Price and payment is full compensation for all materials, labor, tools, equipment, supplies, testing, and incidentals to complete the item of work

Payment will be made under:

Item No. 687	Traffic Signal Timing	Lump Sum
--------------	-----------------------	----------

The GDOT Construction Project Manager, at his/her discretion may choose to pay a partial payment based upon percent complete.

Exhibit 687-3

Methodology for Clearance Intervals

Local controller timings will be developed for each of the three (3) intersections in this project. Table 3 details the clearance interval values that will be used for each signal phase.

**Table 3
Clearance Interval Values**

Phase Interval	Interval Value
Walk Interval	4 seconds typical and 7 seconds for intersections near schools or with high pedestrian traffic.
Flashing Don't Walk	Distance from the curb to curb divided by 3.5 feet/second (typically) or 3.0 feet/second for schools and elderly Concurrent phases do not need to be equal.
Yellow Interval	$t + (V/(2A + 64.4g))$ Concurrently terminating phases should be equal (set to higher).
All Red Interval	$(W + L) / V$ Concurrently terminating phases should be equal (set to higher). Max red interval = 3.0 seconds
	t = perception reaction time (1 second) V = posted speed in feet/second A = deceleration rate (10 feet/second/second) W = intersection width measured from stop bar to edge of through travel lane L = length of vehicle (assume 20 feet) g = The average of three field-measured approach grades, at the stop bar, midway to the setback loop, and at the setback loop, will be used to determine approach grades. This value will then be divided by 100.

In addition, left-turn clearance calculations will be based on a turning speed of 25 mph. Through movements will be based on the posted speed limit.

SIGNAL TIMING GUIDELINES

The City of XX Traffic Engineering will use the following guidelines for traffic signal timing. These guidelines are not a substitute for good engineering judgement.

1. Compute minimum green intervals by applying Greenshields formula ($t = 4+2n$) to a minimal queue associated with off-peak conditions. Round off to nearest second as necessary. Typical assignments are as follows:

4 sec – Turn Arrows and Low speed (*30 MPH) minor street approaches controlled by 40 foot presence loops; T intersections.

6 sec – Medium speed (*40 MPH) minor street approaches.

8 sec – High speed (>40 MPH) minor street approaches.

12 sec – Medium speed (*40 MPH) main line approaches.

15 sec – High speed (>40 MPH) main line approaches.

Set the maximum variable initial greater than the maximum time needed to clear the queue of vehicles that has accumulated between the stop line and the loop.

2. Passage time is computed as follows:

$$\text{Distance from stop line}/(\text{Speed Limit}*1.47)$$

3. Determine the maximum green time using the procedures described in chapter nine of the Highway Capacity Manual.
4. Compute the yellow change interval according to the Institute of Transportation Engineers recommended procedure.

$$Y = t + \frac{v}{2a \pm 64.4g}$$

Where: Y = length of yellow interval to nearest 0.1 second

t = driver perception/reaction time, recommended as 1.0 second.

v = approach speed, in fps (MPH*1.47), taken as the 85th percentile speed or speed limit.

a = deceleration rate stopping, recommended as 10 ft/sec².

g = grade of approach, in percent divided by 100 (downhill is negative)

Note: The City of XX Traffic Engineering will use the 85th percentile speed to enter the table. If a speed study is not available, the speed limit is used. Use 25 MPH for all turning movements.

5. The red clearance interval will follow the Institute of Transportation Engineers recommended procedure.

$$R = \frac{W + L}{V}$$

Where: R = length of red clearance, to the nearest 0.1 second
W = width of intersection, in feet, measured from the nearside stop line to the far edge of the conflicting traffic lane along the actual vehicle path.
L = length of vehicle, recommended as 20 feet
V = speed of the vehicle through the intersection, in ft/sec

Note: The City of XX Traffic Engineering will use the 85th percentile speed to enter the table. If a speed study is not available, the speed limit is used. Use 25 MPH for all turning movements.

6. Calculate the "Pedestrian Clearance" for each leg at which pedestrian crossings are permitted. This is the crossing width divided by the walking speed (4.0 ft/sec, or 3 – 3.5 ft/sec in areas where school children or handicapped pedestrians may be present). This value is used for the flashing "DON'T WALK" interval. The "WALK" interval is 4 to 7 seconds as determined by minimum pedestrian volumes. These values are used for actuated pedestrian phases with or without pedestrian signals.

Crossing leg refers to the leg of the intersection the data applies.

Crossing width is the distance for the pedestrian to cross from the point at which he would wait for a crossing opportunity to the middle of the furthest travel lane.

Fixed time controllers or phases on recall, adjust the vehicle minimum green interval to "Pedestrian Minimum Green" (Pedestrian clearance plus Walk). This value is useful since it represents the minimum green split (less vehicle clearance) that must be allowed for in coordination.

Note: If the roadway is 28 feet wide or less, then the crossing width is from the edge of pavement to the edge of pavement. Pedestrian Clearance shall not be less than 8 seconds.

Intersection Summary

Area Type: Other
 Cycle Length: 140
 Actuated Cycle Length: 140
 Offset: 125 (89%), Referenced to phase 2:NBT and 6:SBTL, Start of 1st Green
 Natural Cycle: 60
 Control Type: Actuated-Coordinated
 Maximum v/c Ratio: 0.75
 Intersection Signal Delay: 8.3
 Intersection LOS: A
 Intersection Capacity Utilization 64.3%
 ICU Level of Service C
 Analysis Period (min) 15
 # 95th percentile volume exceeds capacity, queue may be longer.
 Queue shown is maximum after two cycles.

Local Intersection Timing Plan Checklist

Project Name: XX Road Signal Timing Intersection: _____
 Project Number: Task Order XX Checked by: _____ Date: _____
 Client: City of XXX Reviewed by: _____ Date: _____
 Project Manager: _____ Approved by: _____ Date: _____

1. Intersection Phases

___ Verified vehicle and pedestrian phases in use correspond to phases shown on the intersection diagram.

	1	2	3	4	5	6	7	8
Vehicular Phases								
Initialization Status								
Pedestrian Phases								

2. Phasing Sequence

Describe any non standard phasing sequence (non standard phasing orders, exclusive phases). List once only if phasing sequence does not change by time of day; otherwise list for each plan along with the description of the sequence and purpose of the non-standard sequence. Examples are lead/lag, phase-omit by time of day, split phasing and exclusive pedestrian phases.

2013 Edition

Preface

The text included in Specification Sections 148, 149, and 151 through 941 is written in the imperative mood (sentences often begin with commands). All commands and references in, or in connection with, these Specifications (including all text, related documents, electronic media, graphics, or photographs) are written to imply **Contractor responsibility for action**—unless otherwise specified.

Text placed in text boxes within a Specification does not imply any greater significance than any other text in the Specification.

The Specifications contain dual units of measurement—The United States Standard Measure (English units) and the International System of Units (SI or “metric” units). The English units are expressed first with the SI (metric) units following in parentheses. The measurements expressed in the two systems of units are not necessarily equal. In most cases the measurement in SI units is a “hard” conversion of the English measurement. That is, the SI (metric) unit is a rounded, rationalized SI measurement that is easy to work with and remember.

The Proposal will designate whether the Project was designed and is to be constructed in either English units (English project) or SI units (metric project). The dimensions, measurements, and requirements stated in the system of units designated in the Proposal are the applicable Specification requirements for the Contract. All Contractor submittals shall be prepared in the designated system of units. Pay Item quantities will be measured in the designated system of units.

Section 101—Definitions and Terms

Whenever in these Specifications or in other Contract Documents the following terms or pronouns in place of them are used, the intent and meaning shall be interpreted as follows:

101.01 Abbreviations

Wherever the following abbreviations are used in the Specifications or on the Plans, they are to be construed the same as the respective expressions represented.

Abbreviation	Term
AAN	American Association of Nurserymen
AAR	Association of American Railroads
AASHTO	American Association of State Highway and Transportation Officials
ACI	American Concrete Institute
AGC	Associated General Contractors of America
AIA	American Institute of Architects
AIEE	American Institute of Electrical Engineers
AISC	American Institute of Steel Construction
AISI	American Iron and Steel Institute
AMS	Aerospace Materials Specification
ANSI	American National Standards Institute
ARA	American Railway Association
AREMA	American Railway Engineering and Maintenance of Way Association
ASCE	American Society of Civil Engineers
ASLA	American Society of Landscape Architects
ASTM	American Society of Testing and Materials
AWPA	American Wood Preservers' Association
AWWA	American Water Works Association
AWS	American Welding Society
CRSI	Concrete Reinforcing Steel Institute
DOT	Georgia Department of Transportation
EEO	Equal Employment Opportunity
FHWA	Federal Highway Administration
FSS	Federal Specifications and Standards, General Services Administration
GDT	Georgia Department of Transportation
IES	Illuminating Engineering Society
MUTCD	Manual on Uniform Traffic Control Devices
NEC	National Electrical Code
NEMA	National Electrical Manufacturers Association
NESC	National Electrical Safety Code

Abbreviation	Term
NFPA	National Fire Protection Association
SAE	Society of Automotive Engineers
SPIB	Southern Pine Inspection Bureau
SSPC	Steel Structure Painting Council
UL	Underwriters Laboratories, Inc.

101.02 Acceptance Plans

A defined method of taking and evaluating measurements for the purpose of determining the acceptability of a lot of material or construction.

101.03 Advertisement

The public announcement as required by law, inviting bids for work to be performed or materials to be furnished.

101.04 Available Day

Any calendar day exclusive of Saturdays, Sundays, and Legal Holidays on which the Engineer determines that the Contractor is not prevented from accomplishing at least five hours of productive work on the controlling item or items of work which would normally be in progress at that time by causes beyond his control, and not due to his fault or negligence, including but not restricted to unsuitable weather and its aftermath, suspension order of the Engineer, acts of God, acts of public enemy, fire, flood, epidemic, quarantine, strikes, or freight embargo.

101.05 Award

The formal acceptance by the Department of a Bid.

101.06 Base Course

One or more layers of specified material of designed thickness placed on a subgrade or a subbase to support a surface course.

101.07 Bid

See Proposal.

101.08 Bid Item

A specifically described unit of work for which a price is requested in the Proposal.

101.09 Bidder

A qualified individual, firm or corporation, or combination thereof, submitting a written Proposal for the Work advertised.

101.10 Board

The State Transportation Board.

101.11 Bridge

A structure, including supports, erected over a depression or an obstruction, such as water, a highway or a railway, etc., and having a track or passageway for carrying traffic, water or other moving loads and having an opening measured along the center of the roadway of more than 20 ft (6 m) between undercopings of abutments or extreme ends of openings for multiple boxes.

A. Bridge Length

The overall length of a structure measured along the center of the roadway between backs of abutment backwalls or between ends of bridge floor.

B. Bridge Roadway Width

The clear width of a structure measured at right angles to the center of the roadway between the bottom of curbs or, if curbs are not used, between the inner faces of parapet or railing.

C. Bridge Complete

An entire bridge including its substructure and superstructure.

D. Completed Bridge Site

Unless otherwise shown on the Plans or indicated in the Proposal, a Completed Bridge Site is one in which all grading is completed to subgrade elevation (except for the stage construction providing a bench for the end bent). The minimum acceptable length of completed full-depth embankment shall equal the maximum width of fill between slope stakes at the particular end of bridge. This minimum length of full-depth embankment will be measured along the roadway centerline away from the end-of-bridge station.

In cut sections, a Completed Bridge Site shall be considered to be complete when the excavation is down to the subgrade elevation and extends 50 ft (15 m) beyond the outer limits of the bridge in each direction.

In all cases, positive surface drainage shall be in place and functioning and all temporary erosion control measures shall be installed, functioning, and maintained.

101.12 Calendar Day

Every day shown on the calendar beginning at 12:00 midnight.

101.13 Chief Engineer

The Engineering Executive appointed by the State Transportation Board, or other authority as may be provided by law, and acting for the Department within the authority and scope of duties assigned.

101.14 Commissioner

The Commissioner of the Department of Transportation.

101.15 Completion Date

The calendar date by which the Contract shall be completed when such date is shown in the Proposal in lieu of the stipulation of a number of available days or calendar days.

101.16 Contract

The written agreement between the Department and the Contractor setting forth the obligations of the parties thereunder, including, but not limited to, the performance of the Work, the furnishing of labor and materials, and the basis of payment.

The Contract includes the Advertisement, Proposal, Contract Form and Contract Bond, Specifications, Supplemental Specifications, Special Provisions, general and detailed Plans, Notice to Proceed, and also any Supplemental Agreements that are required to complete the construction of the Work in an acceptable manner, including authorized extensions thereof, all of which constitute one instrument. No oral agreement or orders are to be considered as valid or as a part of the Contract.

101.17 Contract Bond (Performance and Payment Bond)

The approved form of security executed by the Contractor and his Surety or Sureties, which guarantees complete execution of the Contract and all Supplemental Agreements pertaining thereto, and the payment of all legal debts pertaining to the construction of the Project.

101.18 Contract Item (Pay Item)

A specifically described unit of work for which a price is provided in the contract.

101.19 Contract Time

The number of available days or calendar days allowed for the completion of the Contract, including authorized time extensions.

If a Completion Date is shown in the Proposal, the Contract Time then shall be the period between the issuance of the Notice to Proceed and the calendar date shown in the Proposal as the completion date.

101.20 Contractor

The individual, firm, corporation or combination thereof or governmental organization contracting with the Department for performance of prescribed work.

101.21 Culvert

Any structure under the roadway with a clear opening of 20 ft (6m) or less measured along the center of the roadway.

101.22 Department

The Department of Transportation, State of Georgia.

101.23 Easement

A right, other than the acquisition of title, acquired to use or control property for a designated purpose.

101.24 Engineer

The Chief Engineer of Georgia, acting directly or through a duly authorized representative.

101.25 Equipment

All machinery, apparatus, and tools necessary for the proper construction and acceptable completion of The Work, plus the necessary repair parts, tools, and supplies for upkeep and maintenance.

101.26 Extension Agreement

A written agreement entered into by and between the Department and the Contractor extending The Work beyond its original boundaries and prescribing additional work to be done including the basis of payment and time allowed for completion.

101.27 Extra Work

An item of work not provided for in the Contract as awarded but found essential to the satisfactory completion of the Contract within its intended scope.

101.28 Force Account

A method of payment for Extra Work when a Supplemental Agreement is not arrived at between the Engineer and the Contractor.

101.29 General Terms

Whenever the following words or similar terms appear herein, they shall be understood to imply “by or to the Engineer,” unless the context clearly indicates a different meaning:

“acceptable,” “approved,” “authorized,” “called for,” “considered necessary,” “contemplated,” “deemed,” “designated,” “directed,” “established,” “given,” “indicated,” “ordered,” “permission,” “permitted,” “required,” “satisfactory,” “specified,” “sufficient,” “suitable,” “suspended,” “unacceptable,” “unsatisfactory,” “unsuitable.”

101.30 Highway—Road—Street

Each of these words is a general term denoting a public way for the purpose of vehicular travel including the entire area within the Rights Of Way.

101.31 Holidays

In the State of Georgia, holidays occur on:

Date	Holiday
January 1	New Year’s Day
3rd Monday in January	King’s Birthday
January 19	Lee’s birthday
3rd Monday in February	Washington’s birthday
April 26	Confederate Memorial Day
Last Monday in May	National Memorial Day
July 4	Independence Day
1st Monday in September	Labor Day
2nd Monday in October	Columbus Day
November 11	Veterans’ Day
4th Thursday in November	Thanksgiving Day
December 25	Christmas Day

If any of these Holidays fall on Sunday, the following Monday is considered to be the Holiday; if any of the Holidays fall on Saturday, the preceding Friday is considered to be the Holiday.

101.32 Inspector

The Engineer’s authorized representative assigned to make a detailed inspection of Contract performance of any or all portions of The Work or materials thereof.

101.33 Invitation for Bids

See 101.03 Advertisement.

101.34 Laboratory

The testing laboratories of the Department or any other testing laboratory that may be designated by the Engineer.

101.35 Liquidated Damages

The fixed charges assessed against the successful Bidder or the Contractor for failure to execute the Contract or to complete the Contract within the Contract Time.

101.36 Materials

Any substances specified for use in the construction of The Work.

101.37 Materials Allowance

Payment for materials on hand as defined in Subsection 109.07, not to be confused with Partial Payments for work completed.

101.38 Median

The portion of a divided highway separating the traveled ways for traffic moving in opposite directions.

101.39 Minor Structures

Any structure not defined as a bridge.

101.40 Notice to Contractors

A written Notice soliciting Proposals, mailed to Contractors, suppliers and others in the Construction Industry, which will indicate with reasonable accuracy the quantity and location of the Work to be done or the character and quantity of the material to be furnished and the time and place of the opening of Proposals.

101.41 Notice To Proceed

Written notice to the Contractor to proceed with the Contract Work.

101.42 Pavement Structure

The combination of subbase, base course, and surface course placed on a subgrade to support the traffic load and distribute it to the roadbed.

101.43 Pay Item

See 101.18 Contract Item (Pay Item).

101.44 Performance and Payment Bond

See 101.17 Contract Bond (Performance and Payment Bond).

101.45 Plans

The approved plans, profiles, typical cross sections, working drawings and supplemental drawings or exact reproductions thereof, which show the location, character, dimensions, and details of The Work.

101.46 Prequalification

The procedure established and administered by the Department by virtue of which prospective Bidders are required to establish their responsibility and competence in advance of submission of Proposals.

101.47 Project

The specific section or sections of the transportation system together with all appurtenances and construction to be performed thereon under the Contract.

101.48 Proposal

The offer of a Bidder, on the prescribed form, to perform The Work and to furnish the labor and materials at the prices quoted.

101.49 Proposal Guaranty

Acceptable surety furnished by a bidder as a guaranty that he will enter into a contract and will furnish contract performance and payment bonds if a contract is awarded to him.

101.50 Right-of-Way

A general term denoting land, property, or interest therein, usually, but not required to be, in a strip, acquired for or devoted to a highway and its appurtenant structures.

101.51 Roadbed

The graded portion of a highway within top and side slopes, prepared as a foundation for the pavement structure and shoulder.

101.52 Roadside Development

Those items necessary to the complete highway which provide for the preservation of landscape materials and features; the rehabilitation and protection against erosion of all areas disturbed by construction through seeding, sodding, mulching and the placing of other ground covers; such suitable planting and other improvements as may increase the effectiveness and enhance the appearance of the highway.

101.53 Roadway

The portion of a highway within the limits of construction.

101.54 Salvaged Material

Material having value that is to be removed, preserved, or stockpiled as directed for later use by the Department. Specific reference is made to Subsection 610.3.05.A.

101.55 Shall or Will, Should, May

As used in these Specifications, the following definitions apply:

SHALL or WILL—A mandatory condition. When certain requirements are described with the “shall” or “will” stipulation, it is mandatory that the requirements be met.

SHOULD—An advisory condition. Considered to be recommended but not mandatory.

MAY—A permissive condition. No requirement is intended.

101.56 Shoulder

The portion of the roadway contiguous with the traveled way for accommodations of stopped vehicles, for emergency use, and for lateral support of base and surface courses.

101.57 Sidewalk

That portion of the roadway primarily constructed for the use of pedestrians.

101.58 Skew or Skew Angle

The acute angle between the centerline of the roadway and a line parallel to a pier, bent, or abutment of a bridge or parallel to the centerline of a culvert.

101.59 Special Provisions

Additions or revisions to the Standard or Supplemental Specifications, applicable to an individual Project.

101.60 Specifications

A general term applied to all directions, provisions and requirements pertaining to performance of The Work.

101.61 Standard Specifications

A publication titled:

“DEPARTMENT OF TRANSPORTATION, STATE OF GEORGIA STANDARD SPECIFICATIONS, CONSTRUCTION OF TRANSPORTATION SYSTEMS.”

Transportation systems are defined as all modes of transportation, including but not limited to, highways, airports, rail and ports.

101.62 State Highway Engineer

See 101.13 Chief Engineer.

101.63 State

The State of Georgia.

101.64 Station

When used as a term of measurement will be 100 linear ft (1 km) measured horizontally.

101.65 Structures

Bridges, culverts, catch basins, drop inlets, retaining walls, cribbing, manholes, endwalls, buildings, sewers, service pipes, underdrains, foundation drains, and other features that may be encountered in The Work and not otherwise classified herein.

101.66 Subbase

The layer or layers of specified or selected material of designed thickness placed on a subgrade to support a base course.

101.67 Subcontractor

Any individual, firm, corporation, or combination thereof to which the Contractor with the written consent of the Department sublets any part of the Contract.

101.68 Subgrade

The top surface of a roadbed upon which the pavement structure and shoulders are constructed— generally the top 12 in (300 mm) within cuts and fills.

101.69 Subgrade Treatment

Modification of subgrade material by stabilization.

101.70 Stabilization

Modification of soils or aggregates by incorporating materials which will increase load bearing capacity, firmness, and resistance to weathering or displacement.

101.71 Substructure

All of that part of the bridge structure below the bearings of simple and continuous spans, skewbacks of arches and top of footings of rigid frames, including backwalls, wingwalls and wing protection railings.

101.72 Superintendent

The Contractor’s authorized representative directly and solely responsible for the supervision and direction of The Work.

101.73 Superstructure

The entire bridge structure except the substructure.

101.74 Supplemental Agreement

A written agreement entered into by and between the Department and the Contractor covering modifications or alterations to the original Contract, and establishing any necessary new Contract Items, any other basis of payment, and any time adjustments for The Work affected by the changes. This Agreement becomes a part of the Contract when properly executed and approved.

101.75 Supplemental Specifications

Approved additions to or revisions of the *Standard Specifications*.

101.76 Surety

The corporation, partnership or individual, other than the Contractor, executing a Bond furnished by the Contractor.

101.77 The Work

The Work shall mean the furnishing of all labor, materials, equipment, superintendence and other incidentals necessary or convenient to the successful completion of the Project and the carrying out of all the duties and obligations imposed by the Contract.

101.78 Titles (or Headings)

The titles or headings of the Sections and Subsections in these Specifications are intended for convenience of reference and shall not be considered as having any bearing on the interpretation of the Specifications.

101.79 Traveled Way

The portion of the roadway for the movement of vehicles, exclusive of shoulders and auxiliary lanes.

101.80 Treasurer

The Treasurer of the Department of Transportation.

101.81 Working Drawings

Any supplementary drawings or similar data which the Contractor is required to submit to the Engineer for approval including but not limited to stress sheets, shop drawings, erection plans, falsework plans, framework plans, cofferdam plans, and bending diagrams for steel.

101.82 Related References

Listing of Specifications and documents contained in the Section are intended for convenience of reference and shall not be considered as having any bearing on the interpretation of the Specifications.

Section 102—Bidding Requirements and Conditions

102.01 Prequalification of Bidders

Before submitting a bid in excess of \$2,000,000, the Bidder shall have been prequalified with the Department and received a Certificate of Qualification in accordance with the Rules and Regulations approved and adopted by the State Transportation Board. Bidders submitting bids of \$2,000,000 or less shall have been registered with the Department. In addition, the aggregate total amount a Non-prequalified Bidder may have under contract shall not exceed \$4,000,000.

Bidders intending to consistently submit Proposals shall prequalify at least once every two years. However, qualifications may be changed during that period upon the submission of additional favorable reports or upon unsatisfactory performance. In addition, the Department reserves the right at any time to require the Contractor to furnish a current financial and experience statement.

102.02 Competency of Bidders

The Department may limit the amount of work awarded to any Contractor, based on the information furnished the Department in the Prequalification process. The Department may also limit the aggregate amount of work awarded to any non-prequalified Contractor.

The Department may refuse any Contractor Proposals to bid on additional work if the Contractor is behind schedule on work he has with the Department, as determined from the Progress Schedule called for in the Specifications. This refusal will apply to all applications for Proposals, made in the name of an individual, firm, partnership, or corporation with which the delinquent Contractor is affiliated.

102.03 Contents of Proposal Forms

The Department will make available to the prospective Bidder a Void for Bidding Proposal Form which may be accessed on the Office of Construction Bidding Administration web page. This form will state the location and description of the contemplated construction and will show the approximate estimate of the various quantities and kinds of work to be performed or materials to be furnished, and will have a schedule of Items for which Unit Bid prices are invited. The Proposal Form will state the time in which The Work must be completed, the amount of the Proposal Guaranty, and the date of the opening of Proposals. The Form will also include any Special Provisions or requirements that vary from or are not contained in the *Specifications*. Also included with each Proposal Form will be a Non-Collusion Certificate, Construction Contractors Bid Opportunity List, and Request For Eligibility To Bid. All papers contained in the Proposal Form are considered a part thereof and must not be detached or altered. The Plans, Specifications, and other documents designated in the Proposal Form will be considered a part of the Proposal whether attached or not.

102.04 Interpretation of Estimates

The quantities of work to be performed and materials to be furnished to complete the construction of The Work as shown on the Plans and contained in the Proposal are approximate and are to be used for comparing Bids. The Department does not guarantee that the quantities indicated on the Plans or given in the Proposal will be the actual construction quantities. The Contractor shall not plead deception or misunderstanding because of variation from these quantities or minor variations from the locations, or character of the Work. Payment to the Contractor will be made only for the actual quantities of work performed in accordance with the Plans and Specifications. If, when construction is completed, the actual quantities are more or less than the quantities given in the Proposal, the Unit Prices Bid in the Proposal will still prevail, except as otherwise provided in Subsection 104.03 and Subsection 109.05.

102.05 Examinations of Plans, Specifications, Special Provisions, and Site of the Work

The Bidder is expected to examine carefully the site of the proposed work, the Proposal, Plans, Specifications, Supplemental Specifications, Special Provisions, and Contract forms before submitting a Proposal. The submission of a Proposal shall be considered prima facie evidence that the Bidder has made such examination and is satisfied as to the conditions to be encountered in performing The Work and as to the requirements of the Plans, Specifications, Supplemental Specifications, Special Provisions, and Contract.

It is the obligation of the Bidders to make their own interpretation of all subsurface data that may be available as to the nature and extent of the materials to be excavated, graded, or driven through. Such information, if available and furnished to the Bidders by the Department, does not in any way guarantee the amount or nature of the material which may be encountered.

102.06 Preparation of Proposal

The Bidder shall submit its Proposal on the form furnished by the Department (GADOT). The blank spaces on the Proposal shall be filled in correctly for each Pay Item (except alternate items) and the Bidder shall write in ink the Unit Price or a Lump Sum Price as called for in the Proposal for each Pay Item listed therein. In addition, the Bidder shall also show the products of the respective Unit Prices and quantities and the total amount of the Bid by adding the amounts of all Bid Items. In the event of a discrepancy in any of the figures, the Unit Price will govern and the Bid will be recalculated.

In the case of Alternate items, Unit Prices shall be entered for only one alternate.

The Non-Collusion Certificate on the Department's standard form included in the Proposal shall be executed.

The Certificate of Current Capacity shall be executed under oath and substantiated by the report of Status of Contracts on Hand.

The Construction Contractors Bid Opportunity List standard form shall be completed with the required information.

The Georgia Security and Immigration Compliance Act Affidavit shall be completed with the required information.

The Bidder shall notify the GADOT Office of Construction Bidding Administration by transmitting the completed Request For Eligibility To Bid Form D. O. T. RFETB for each Letting Call Order Number in which the Bidder intends to submit a bid by no later than 12:00 p.m. the day prior to the letting.

If the Proposal is made by an individual, its name and post office address shall be shown; if by a partnership, the name and post office address of one member of the partnership shall be shown; if by a corporation, the Proposal shall show the name, title and business address of the officer signing the Proposal. The Bidder's Proposal shall be signed in ink or by Digital Signature by the individual, by one or more members of a partnership, or by one or more of the officers of a corporation, whichever is applicable. In the event of a joint venture, the Proposal shall be signed in ink or by Digital Signature by each individual involved, by each partnership through one or more of its members, or by each corporation through one or more officers of the corporation, whichever is applicable. Proposals not properly signed may be disqualified and rejected.

All bids shall be submitted using the GADOT/AASHTO (American Association of State Highway and Transportation Officials) Electronic Bidding System (Expedite). When submitting a bid electronically, the Bidder's Proposal shall consist of the Bid pages generated by the Expedite software including the Cover page, Bid Item pages, Disadvantaged Business Enterprise (DBE) pages (if applicable), Miscellaneous Data pages and the Signature page. By submitting a bid electronically, the Bidder acknowledges all requirements included in the proposal, amendments, plans, Standard Specifications, and Supplemental Specifications are a part of the Bid and Contract.

The electronic bid shall be submitted by one of the following methods:

A. Hand delivery of the electronic bid to the Department at the place specified in the Notice To Contractors.

The bid shall include the 3 ½ inch (90 mm) electronic diskette or CD Rom or USB Drive and the Bid pages described above.

B. Electronic Bid Submission via the Internet and Bid Express™.

(Note: The Bidder shall secure an account and a valid Digital Signature from Bid Express™ (www.bidx.com) in order to use this method.

Instructions for preparing and submitting bids by these two methods are as follows:

A. Hand Delivery of Bid to the Department

1. Access to the electronic bidding information is available on Bid Express™ at www.bidx.com and the GADOT Construction Bidding Administration Internet Web Site at www.dot.ga.gov/doingbusiness/contractors/pages/default.aspx.

Section 102-Bidding Requirements and Conditions

2. Electronic bids shall be prepared through the use of a computer controlled printer.
3. The Bidder shall sign the electronic bid in the appropriate areas.
4. When installing the Bid program the Bidder shall enter their vendor code in the following format: 2DO900. Before running the electronic bidding programs, the Bidder shall read the on-line help documentation for the Expedite software.
5. **Zero (0) is considered to be a valid bid. The Bidder shall not enter 0 in any Unit Price field unless zero is the intended bid for that item.**
6. All addenda shall be included in the electronic bid submitted.
7. For “Joint Bids” the Bidder shall select **tools** from the Windows Expedite menu and mark the electronic bid as **“Joint Bid”**.
8. The Bidder shall select **tools** and then **check bid** to check the bid and assure there are no errors prior to printing the electronic bid. After final printing, the Bidder may make changes to the electronic bid by indicating the changes in ink and initialing prior to submitting the bid.
9. Once the Bidder has completed the bid and made all desired changes, the diskette/CD Rom/USB Drive, a printout of the Cover sheet, Bid Item pages, DBE pages (if applicable), Miscellaneous Data pages, and Signature page shall be submitted to the Department. In case of a discrepancy between the diskette and the hard copy of the Bid Item pages, the hard copy will govern.
10. Electronic Bid pages shall be 8 ½ inch (216 mm) horizontal by 11 inch (279 mm) vertical. Bid information shall be placed across the horizontal width on each page.
11. The paper used for an electronic bid shall be of sufficient quality and durability to maintain clear and concise images and to withstand frequent handling.
12. If originally printed on continuous roll paper, electronic bids shall be separated before submitting the Bid to the Department.
13. All computer printed characters shall be legible. The Electronic Bid pages shall be submitted in the bid envelope provided.
14. The diskette shall be submitted in a separate sealed envelope from the Bid pages. The Bidder shall submit all electronic bids on one diskette/CD Rom/USB Drive. The envelope containing the diskette shall include the Bidders name and the Letting Call Order Numbers for which electronic bids are submitted.

B. Electronic Bid Submission Via The Internet And Bid Express™

1. Access to the electronic bidding information is available on Bid Express™ at www.bidx.com and the GADOT Construction Bidding Administration Internet Web Site at www.dot.ga.gov/doingbusiness/contractors/pages/default.aspx.
2. When installing the Bid program the Bidder shall enter their vendor code in the following format: 2DO900. Before running the electronic bidding programs, the Bidder shall read the on-line help documentation for the Expedite software.
3. **Zero (0) is considered to be a valid bid. The Bidder shall not enter 0 in any Unit Price field unless zero is the intended bid for that item.**
4. All addenda shall be included in the electronic bid submitted.
5. **“Joint Bids” are allowed with Electronic Bid Submission via the Internet and Bid Express™**
6. The Bidder shall select **tools** and then **check bid** from the Windows Expedite menu to check the bid and assure there are no errors prior to submitting the electronic bid. The electronic bid may be changed and resubmitted electronically to Bid Express™ as many times as desired prior to the advertised cutoff time specified in the Notice To Contractors. The last bid submitted for a given Letting Call Order Number prior to the cutoff time will be the Bid.
7. The Bidder shall make no claim against the Department in the event it is unable to submit its bid to Bid Express™ and/or Bid Express™ is unable to submit the bid(s) to the Department. The Department reserves the right to postpone the public posting of bids in the event of technical difficulties.

- C.** A fully executed Proposal Guaranty and Power of Attorney for each Letting Call Order Number bid shall be submitted by one of the following methods:

Section 102-Bidding Requirements and Conditions

1. Delivery to the GADOT Office of Construction Bidding Administration, Room 1113, in a sealed envelope by 12:00 noon on the day prior to the Bid Opening. Each Proposal Guaranty shall be clearly and legibly marked with the Letting Call Order Number.
2. Electronic submission via the Internet and Bid Express™ by the time and date set in the Notice To Contractors for submission of Proposals.

The Proposal Guaranty for a “Joint Bid” shall include the names of all Joint Venture parties involved in the bid.

102.07 Rejection of Proposals

Proposals may be rejected as irregular if their consideration is conditioned upon the acceptance or rejection of other Proposals submitted by the same Bidder, if the Georgia Security and Immigration Compliance Act Affidavit is not completed, if the Request For Eligibility To Bid D.O.T (Form RFETB) has not been submitted, if the Certificate of Current Capacity is not executed under Oath and substantiated, if a Unit Price is not shown for each Pay Item, or if they fail to comply with the Electronic Bidding System (EBS) bidding requirements. In the case of alternate items, Unit Prices shall be entered for only one alternate. The Department reserves the right to disqualify and reject any Proposal that is not properly signed in accordance with the requisite of Subsection 102.06.

A. Collusion

Any and all Proposals will be rejected if the Department believes that collusion exists among the Bidders and no participant in such collusion may submit future Proposals for the same work. The Department reserves the right to review and to refuse to consider any Proposal if the Bidder fails to execute the Non-Collusion Certificate.

B. Single Proposals

Only one Proposal from any person, partnership, or corporation under the same or different names shall be submitted on any Project.

C. Unbalanced Bids

Proposals may be rejected if any of the Unit Prices are obviously unbalanced. The Department will decide whether any Unit Prices are unbalanced either excessively above or below a reasonable cost analysis value determined by the Engineer, particularly if these unbalanced amounts are substantial and contrary to the interest of the Department.

D. Omissions and Alterations

Proposals may be rejected as irregular if they show any omissions, alterations of form, additions or conditions not called for, unauthorized alternate bids, erasures or changes not initialed, or other irregularities.

E. Debts

The Department reserves the right to reject Proposals from Bidders who have not paid or satisfactorily settled all legal debts due on other Contracts at the time Proposals are received.

F. Technicalities

The Department reserves the right to reject any and all Proposals and to waive technicalities at any time before the Contract has been signed by the Department.

G. Non-Prequalified Bidders

Proposals submitted in excess of \$2,000,000 by non-prequalified contractors under Rule 672-5 of the Department’s Rules and Regulations Governing the Prequalification of Prospective Bidders will be disqualified and rejected.

H. Failure to List Disadvantaged Business Enterprise (DBE) Participants

If the contract has an established DBE goal, the Department reserves the right to reject and disqualify any proposal if the bidder has failed to list bona fide DBE participants with sufficient participation to achieve at least the established goal. The Department may consider for award a proposal with less participation than the established goal if both:

- The bidder can demonstrate that no greater participation could be obtained and;
- The participation proposed by the low bidder is not substantially less than the participation proposed by the other bidders on the same contract.

I. Failure to Submit Georgia Security and Immigration Compliance Act Affidavit

No Proposal will be considered without submission of the completed Georgia Security and Immigration Compliance Act Affidavit for each Letting Call Order Number by no later than the 12:00 p.m. the day prior to the letting.

J. Failure to Submit Request For Eligibility To Bid

No Proposal will be considered without submission of the completed Request For Eligibility To Bid Form for each Letting Call Order Number by no later than the deadline 12:00 p.m. the day prior to the letting.

102.08 Proposal Guaranty

No Proposal will be considered unless it is accompanied by a Proposal Guaranty of the character and in an amount not less than the amount indicated in the Proposal. Each bid submitted must be accompanied by a separate Proposal Guaranty. No Proposal Guaranty will be considered to cover any Bid except the one to which it is attached.

102.09 Delivery of Proposals

Each Proposal, together with the Proposal Guaranty, shall be submitted in a sealed envelope so marked as to identify its contents without being opened (See Section 102.06.A), unless submitted electronically via the Internet and Bid Express (See Section 102.06.B). Proposal forms are not transferable. Proposals will be received until the time and date set in the Notice To Contractors and shall be in the hands of the officials indicated by that time. Proposals received after the advertised cutoff time established for submission of Proposals will be returned unopened to the Bidder.

102.10 Withdrawal or Revision of Proposals

Any Bidder may withdraw his Proposal by submitting, by telegram, letter, or facsimile transmission received prior to the advertised cutoff time specified in the Notice To Contractors and verified by the Department, a DEPARTMENT OF TRANSPORTATION BID PROPOSAL WITHDRAWAL FORM, completed by an authorized officer of the company, whose signature is legally binding upon said company.

Any Bidder may submit a Bid change, by telegram, letter, or facsimile transmission received prior to the advertised cutoff time specified in the Notice To Contractors and verified by the Department, completed by an authorized officer of the company, whose signature is legally binding upon said company. In which case, the Department will change the Bid at the time of opening and at such time will announce that a change was received.

102.11 Public Bid

Bid results will be posted and available on Bid Express™ at www.bidx.com and the GADOT Construction Bidding Administration Internet Web Site at www.dot.ga.gov/doingbusiness/contractors/pages/default.aspx. at the time specified in the Notice To Contractors.

102.12 Material Guaranty

The Department reserves the right before the Contract is awarded to require the Bidder to furnish a complete statement of the origin, composition, and manufacture of any or all materials to be used in the construction of The Work, together with samples, which may be subjected to the tests provided for in the Specifications to determine their quality and fitness for The Work.

102.13 Combination or Conditional Proposals

If the Department so elects, proposals may be issued for projects in combination and/or separately, so that bids may be submitted either on the combination or on separate units of the combination. The Department reserves the right to make awards on combination bids or separated bids to the best advantage of the Department. No combination of bids, other than those specifically set up in the proposals by the Department, will be considered. Separate contracts will be written for each individual project included in the combination.

Conditional proposals will be considered only when so stated in the special provisions.

102.14 Landscape Projects

Only qualified Landscape Contractors shall submit bids for Landscape Projects. Qualifications required are as follows:

1. The Contractor shall ensure that all nursery stock used on this project is obtained from a State certified nursery. All work done by the Contractor on this project shall be done under the direct supervision of a licensed nurseryman.
2. The Contractor shall have a certified pesticide operator's license for the State of Georgia and shall furnish evidence of such with the bid.
3. The Contractor shall have satisfactorily executed landscape plantings of a similar nature and shall furnish with this bid a certified statement of such compliance.

102.15 Submittal of "Georgia Security and Immigration Compliance Act Affidavit"

All Bidders for each Letting Call Number shall submit the completed "Georgia Security and Immigration Compliance Act Affidavit" to the GADOT Office of Construction Bidding Administration, Room 1113, in a sealed envelope by 12:00 p.m. on the day prior to the Bid Opening as a matter of Bidder responsibility.

If the "Georgia Security and Immigration Compliance Act Affidavit" is not delivered to the GADOT Office of Construction Bidding Administration, Room 1113, in a sealed envelope by 12:00 p.m. on the day prior to the Bid Opening, the Bid will be subject to rejection.

102.16 Submittal of "Request For Eligibility To Bid"

All Bidders for each Letting Call Number shall submit the completed "Request For Eligibility To Bid Form D. O. T. RFETB" to the GADOT Office of Construction Bidding Administration, Room 1113, by no later than 12:00 p.m. on the day prior to the Bid Opening.

If the "Request For Eligibility To Bid Form D. O. T. RFETB" is not received by the GADOT Office of Construction Bidding Administration, Room 1113, by no later than 12:00 p.m. on the day prior to the Bid Opening, the Bid will be subject to rejection.

102.17 Submittal of "Certificate of Current Capacity" and "Status of Contracts on Hand"

The apparent low Bidder for each Letting Call Number shall submit the executed "Certificate of Current Capacity" and the "Status of Contracts on Hand" to the GADOT Office of Construction Bidding Administration, Room 1113, in a sealed envelope by 12:00 p.m. on the first working day after the Bid Opening.

If the "Certificate of Current Capacity" and the "Status of Contracts on Hand" are not delivered to the GADOT Office of Construction Bidding Administration, Room 1113, in a sealed envelope by 12:00 p.m. on the first working day after the Bid Opening, the Bid may be subject to rejection.

102.18 Submittal of "Construction Contractors Bid Opportunity List"

All Bidders for each Letting Call Number shall submit the completed "Construction Contractors Bid Opportunity List" to the GADOT Office of Construction Bidding Administration, Room 1113, in a sealed envelope by 12:00 p.m. on the third working day after the Bid Opening as a matter of Bidder responsibility.

If the “Construction Contractors Bid Opportunity List” is not delivered to the GADOT Office of Construction Bidding Administration, Room 1113, in a sealed envelope by 12:00 p.m. on the third working day after the Bid Opening, the Bid may be subject to rejection.

Section 103—Award and Execution of Contract

103.01 Consideration of Proposals

After the Proposals are opened and read, the correct sum of the products of the quantities shown in the Proposal multiplied by the Unit Prices Bid will be considered the amount of the Bid. If there is a discrepancy between Unit Bid Prices and extensions, the Unit Bid Price shall govern in accordance with Subsection 102.06. In determining Unit Bid Prices, fractional parts of a cent less than 1/1000 cent (\$0.00001) will not be considered significant and will be dropped. The amounts will then be compared and the results of this comparison will be made public at the time specified in Notice To Contractors. Until the final Award of the Contract, however, the right will be reserved to reject any and all Proposals, to waive technicalities, to advertise for new Proposals, or to proceed to do The Work otherwise if the interest of the Department will be promoted thereby.

If, prior to the award of a contract, the low bidder discovers that an obvious error was made in the preparation of the bid, a request to the Department may be made to allow the withdrawal of the bid without bid bond forfeiture. The decision whether or not to grant such a request rests entirely with the Department and in the discretion of the Department. If such a request is granted, the Department may, in its discretion, award the contract to the next lowest reliable bidder, readvertise, perform the work itself, or abandon the project.

103.02 Award of Contract

If a Contract is Awarded, it will be Awarded to the lowest reliable Bidder whose Proposal shall have met all the prescribed requirements. The Contract will be Awarded, if at all, within 50 calendar days after the opening of the Proposals, unless a longer period is specified in the Proposal or the successful Bidder agrees in writing to a longer period of time for the Award.

Single as well as multiple proposals for a project will be publicly opened and read. If only one proposal is received on a project and the amount of that proposal is equal to or less than the Department’s cost estimate for the project, as certified by the Chief Engineer, the cost estimate will be read.

If only one proposal is received and the amount of that proposal exceeds the Department’s cost estimate for the project, the Department may, at its option, award the contract, or reject the proposal and readvertise, perform the work itself, or abandon the project.

The Award of Contracts involving work financed entirely or in part by Federal funds is conditioned upon the concurrence of the Federal agency involved. No bids will be negotiated or adjusted.

Award to the successful bidder will be made public through the publication of the Award Announcement. If the successful bidder fails to execute the Contract and file acceptable bonds within the period set forth in Subsection 103.07 thereby causing cancellation of the award and forfeiture of the Proposal Guaranty, the Department may award the Contract to the next lowest reliable bidder, readvertise, abandon the project, or perform the work itself.

103.03 Cancellation of Award

The Department reserves the right to cancel the Award of any Contract at any time before the execution of said Contract by all parties without any liability against the Department.

103.04 Return of Proposal Guaranty

All Proposal Guaranties may be retained until the Contract and the Contract Bond have been signed and approved. Early release of Proposal Guaranties will be considered if a request is made in writing. The Department reserves the right to return all Proposal Guaranties by registered or certified mail, and its responsibility pertaining to them will end when they are mailed.

103.05 Requirements of Contract Bonds

The penal sum of the Contract shall be defined as 120 percent of the Original Contract Amount. At the time of the execution of the Contract, and as a part thereof, the successful Bidder shall furnish Contract Bonds as specified below:

Georgia Resident Contractor

Georgia Resident Contractors shall furnish Performance and Payment Bonds as follows:

Performance bond in the full penal sum of the Contract and payment bond in an amount equal to 110 percent of the full penal sum of the Contract. The aggregate amount of the bonds shall be 210 percent of the full penal sum of the Contract.

Nonresident Contractor

Nonresident Contractors shall furnish Contract Bonds as follows:

Performance bond in the full penal sum of the Contract, payment bond in the full penal sum of the Contract, and tax bond in the amount of 10 percent of the full penal sum of the Contract. The aggregate amount of the bonds shall be 210 percent of the full penal sum of the Contract. The tax bond shall represent the nonresident contractor bond required by the Revenue Department in accordance with Sections 48-13-30 through 48-13-38 of the Official Code of Georgia Annotated.

The Bonds shall be made on forms furnished by the Department and executed by the Contractor and a Surety Company acceptable to the Department, authorized to do business in Georgia. In the event the Bond is made by an out of state agent, it shall be countersigned by a Georgia Resident Agent in accordance with the laws of Georgia.

103.06 Execution and Approval of Contract

The Contract shall be signed by the successful Bidder and returned within 15 calendar days after the date of the letter transmitting the Contract to the Bidder. If the Contract is not executed by Department within 30 calendar days following receipt from the Bidder of the signed Contract, unless a longer period is specified in the Proposal or the successful Bidder agrees in writing to a longer period, the Bidder shall have the right to withdraw his Bid without penalty. No Contract shall be considered as effective until it has been fully executed by all of the parties.

103.07 Failure to Execute Contract

Failure to execute the Contract and file acceptable Bonds within 15 calendar days after the date of the letter transmitting the Contract to the Bidder shall be just cause for the cancellation of the Award and forfeiture of the Proposal Guaranty which shall become the property of the Department, not as a penalty, but in liquidation of damages sustained.

If the Department readvertises the project, the Department may, at its discretion, not allow the bidder who refused to Execute the Contract to submit a Proposal on the readvertised project.

Section 104—Scope of Work

104.01 Intent of Contract

The intent of the Contract is to provide for the construction and completion in every detail of The Work described. The Contractor shall furnish all labor, materials, equipment, tools, transportation, and supplies required to complete The Work in accordance with the Plans, Specifications, and terms of the Contract.

104.02 Special Work

Should any construction or conditions not thoroughly or satisfactorily stipulated and set forth by the Standard Specifications and Supplements thereto be anticipated on any proposed work, Special Provisions for such work will be included in the Proposal and the Contract as a part thereof. Should any such Special Provisions contain requirements in conflict with the *Standard Specifications* and Supplements thereto, the Special Provisions will govern.

104.03 Alteration of Plans or Character of Work

A. Authority to Make Changes

The Department reserves the right to make, at any time during the progress of The Work, such increases or decreases in quantities and such alterations in the details of construction, including alterations in the grade or alignment of the road or structure or both, as may be found necessary or desirable. Such increases or decreases and alterations shall not invalidate the contract nor release the Surety, and the Contractor agrees to perform The Work as altered, the same as if it had been a part of the original Contract.

Whenever an alteration in character of work involves a substantial change in the nature of the design or in the type of construction or materially increases or decreases the cost of performance, a Supplemental Agreement acceptable to both parties shall be executed before work is started on such alteration, except that in the absence of a Supplemental Agreement acceptable to both parties, the Engineer may direct that the work be done by Force Account. Any Force Account Agreement shall be in writing, specifying the terms of payment, signed by the State Construction Engineer and agreed to in writing by the Contractor.

All work shall be performed as directed and in accordance with the Specifications.

B. No Waiver of Contract

Changes made by the Engineer will not be considered to waive any of the provisions of the Contract, nor may the Contractor make any claim for loss of anticipated profits because of the changes, or by reason of any variation between the approximate quantities and the quantities of work as done.

C. Certain Items Not Limited

The quantities of all types of excavation, embankment when a Pay Item, perforated underdrain pipe, ditch paving, subgrade treatment materials, stabilizers, extra depth of concrete including its reinforcement, piling, guard rail, asphaltic concrete leveling, erosion control items, traffic control items, slope paving, bridge rip-rap, filter fabric, or any other items that cannot conveniently be determined accurately until after The Work is in progress, and any increase or decrease in these quantities, whatever the amount, will be considered normal overruns or underruns. The Engineer has unlimited authority to increase or decrease these quantities.

D. Changes in Other Quantities

The Engineer may increase or decrease the quantities of any and all other Pay Items, without changing the Unit Prices Bid, provided that the sum total of such changes, exclusive of changes in those items covered in Subsection 104.03.C, does not increase or decrease the original Contract amount by more than 20 percent.

E. Changes to Original Length or Cost of Project

The Engineer has the authority to extend or reduce the total length or total cost of the Project by as much as 20 percent. The provisions of Subsection 104.03.C, covering overruns or underruns of certain Pay Items apply also to overruns or underruns in quantities resulting from an extension or reduction in the length of the Project. If the Project is extended in length, an Extension Agreement will be executed. If the Extension Agreement calls for Pay Items already in the Contract, the Unit Prices for such Items will not be changed except as provided in Subsections 104.03.A, 104.03.B and 104.03.D. New work for which no Unit Prices have been Bid will be paid for as Extra Work as defined in Subsection 104.04.

F. Railroad Grade Separation Structures

Changes in design or construction features of railroad grade separation structures must be submitted to the Engineer of the railroad for approval. The Department will diligently expedite all correspondence with the railroad officials, but will not be responsible to the Contractor for any delay to the Contractor's work resulting from delay in securing the necessary approval. The Engineer will give due consideration to such delays in determining the time for completion of the Contract.

104.04 Extra Work

The Contractor shall perform unforeseen work, for which there is no price included in the Contract, whenever it is necessary or desirable in order to complete fully the work as contemplated. Such work shall be performed in accordance with the Specifications and as directed, and will be paid for as provided in Subsection 109.05.

104.05 Maintenance During Construction

A. Contractor Maintenance

The Contractor shall maintain the Project from the beginning of construction operations until maintenance acceptance or final acceptance of the Project, except as otherwise provided in Subsection 104.05.B. This maintenance shall constitute continuous and effective work prosecuted day by day with adequate equipment and forces to the end that the roadway or structures are kept in satisfactory condition at all times. This includes signing, pavement markings, and traffic control devices as outlined in the Manual on Uniform Traffic Control Devices, Section 150, Project Plans and Special Provisions for Traffic Control. All existing guard rail, signs, pavement, pavement markings, bridge handrail, and other safety appurtenances shall also be maintained in a safe and satisfactory condition.

The Contractor shall not allow vegetative growth at any time to obstruct signs, delineation, traffic movements, or sight distance. The Contractor shall, at intervals not to exceed 6 months, clean up and remove litter and debris; remove all weeds from around guard rail, barrier, poles, standards, utility facilities, and other structures; and cut or trim trees, bushes, or tall grass. These requirements shall apply to all areas within the project termini and lateral limits.

For projects or segments of projects with staging which requires that traffic be maintained through the project limits during the prosecution of The Work, the Contractor shall assume all responsibility for damage to the work until either maintenance acceptance or final acceptance of the section or Project.

On projects constructed with traffic relocated to an alternate roadway or projects constructed on new location, the Contractor shall be responsible for all damage to the work until the Department directs that the Project be opened to traffic. At that time the Contractor will no longer be responsible for traffic related damage to the work other than that attributable to the Contractor's actions or inadequate construction. The Department may direct, however, that traffic-related damage be repaired at existing unit prices or as extra work as provided for in Subsection 104.04.

All costs for maintenance of traffic shall be as provided in Section 150. All other maintenance costs during construction and before the Project is accepted will be included in the Contract Unit Prices and the Contractor will not be paid an additional amount.

B. Maintenance of Traffic During Suspension of Work

During any suspension of work ordered by the Engineer, the Contractor shall make passable and shall open to traffic such portions of the Project and temporary roadways, special detours, or portions thereof as may be agreed upon between the Contractor and the Engineer for the temporary accommodation of necessary traffic during the anticipated period of suspension. Thereafter, and until issuance of an order for the resumption of construction operations, the maintenance of the temporary route or line of travel agreed upon will be by and at the expense of the Department. When work is resumed, the Contractor shall replace or renew any work or materials lost or damaged because of such temporary use of the Project; shall remove to the extent directed by the Engineer any work or materials used in the temporary maintenance thereof by the Department; and shall complete the Project in every respect as though its prosecution had been continuous and without interferences. All additional work caused by such suspensions, for reasons beyond the control of the Contractor, will be paid for by the Department at Contract prices or by Force Account.

C. Maintenance Directed By The Engineer

If the Engineer directs special maintenance for the benefit of the traveling public, the Contractor will be paid on the basis of Unit Prices or under Subsection 104.04. The Engineer will be the sole judge of work to be classed as special maintenance.

D. Detours Outside Right-of-Way

The Department will be responsible for the construction and maintenance of detours outside the right-of-way except where otherwise provided for in the Contract.

E. Special Detours

When the Proposal contains Bid Items which provide for construction, maintenance, and removal of detour bridges or roads, the payment for such items shall cover all cost of constructing and maintaining such detour or detours, including the construction of any and all temporary bridges and accessory features and the removal of the same, and obliteration of

the detour road, except as otherwise provided in Subsection 104.05.B. Right-of-Way for temporary highways or bridges called for under this Subsection will be furnished by the Department.

F. Delays to Traffic

Two-way traffic shall be maintained at all times, unless otherwise approved. The Contractor shall not stop traffic without permission of the Engineer.

When one-way traffic is approved, the Contractor shall provide the necessary flagmen to direct such traffic. When specified in the Proposal, the Contractor shall furnish pilot vehicles.

G. Overhead Sign Lighting

Maintenance of overhead sign lighting within major construction or reconstruction Projects shall be performed by the Contractor at no additional cost to the Department. All required repairs shall be made within 48 hours.

In the event such repairs are not made within the specified time, State Forces may perform them and the cost thereof deducted from any monies due or which may become due the Contractor.

104.06 Right in and Use of Materials Found on the Project

Materials that have salvage value, as determined by the Engineer, shall remain the property of the Department and shall be utilized as directed by the Engineer. The Contractor, with the approval of the Engineer, may use on the Project such materials as may be found on the Project, and will be paid at the bid price for removal of the material. If the materials, after processing, are suitable for other items of work, the Contractor will also be paid for those items in which the material is incorporated except as otherwise provided for in these specifications. He shall replace at his own expense with other acceptable material all of that portion of the materials so removed and used which was needed for use in the embankments, backfills, approaches, or otherwise, including proper allowance for swell when applicable. When existing materials found on the Project, such as crushed stone base, are to be reused directly in the work, the Contractor will not be paid the full Contract Price for the Item, but will be paid at the Contract Price minus the equivalent cost of new materials. The Contractor shall not excavate or remove any material without written authorization from the Engineer. The Contractor shall not make any claim upon the State for damages or loss of anticipated profits because of the expected use of any materials indicated on the Plans as existing and later found to be nonexistent or unfit for use. The Department does not warrant or guarantee the existence, quality, or quantity of materials indicated as existing on the Plans. If any sales tax is involved in materials found on the right-of-way and sold by the Contractor, the Contractor will be responsible for paying same.

Unless otherwise provided, the material from any existing old structure may be used temporarily by the Contractor in the erection of the new structure. Such material shall not be cut or otherwise damaged except with the approval of the Engineer.

Any material used by the Contractor and damaged during use shall be replaced at the Contractor's expense.

104.07 Final Cleaning Up

Before final acceptance, the highway borrow pits and all ground occupied by the Contractor in connection with The Work shall be cleaned of all rubbish, excess materials, temporary structures, and equipment. All weeds and high grass shall be cut and disposed of. The right-of-way shall be mown when directed by the Engineer in accordance with Subsection 700.3.07. All parts of the Work shall be left in an acceptable condition.

The disposal adjacent to the right-of-way of materials cleaned from the right-of-way will not be permitted, even with the permission of the property owner. Temporary buildings or other structures built for the Contractor's use and located within view of the right-of-way, constituting a hazard or making an unsightly appearance, shall be removed and disposed of as directed.

On specialty-type Contracts where the entire Work consists of such specialty items as resurfacing, fencing, stripe painting, signing, highway lighting, and the like, the Contractor will not be required to clean up the right-of-way beyond the limits of construction, unless such clean up work is included in the Contract as a Pay Item. However, he shall remove all of his own property and leave the remaining right-of-way in a condition at least as good as it was before The Work was begun.

As to compliance or non-compliance with these provisions, as well as the obligations of the Contractor in relation thereto, the decision of the Chief Engineer shall be final and conclusive.

104.08 Value Engineering Proposals

A. Applicability

This Section applies to those cost reduction proposals initiated and developed by the Contractor for changing the Plans, Specifications, or other requirements of the Contract. These provisions do not apply unless the proposal submitted by the Contractor is specifically identified as being presented as a Value Engineering Proposal (VEP) and the Contract amount is in excess of \$50,000.

The cost-reduction Proposals contemplated are those discretionary changes which would require a Supplemental Agreement modifying the Contract and would produce a savings to the Department by providing less costly items or methods than those specified in the Contract without impairing essential functions and characteristics including, but not limited to: service life, reliability, economy of operations, ease of maintenance, and safety, both during and after construction. Proposals must provide a product comparable to the original design at a lower cost or improved quality, or both. No proposals will be accepted that lower the quality of the project.

These provisions are applicable to the prime Contract and include all subcontracts.

B. Documentation

Value Engineering Proposals (VEP) will be processed in the same manner as prescribed for any other alterations of the Contract requiring a Supplemental Agreement.

As a minimum, the following information shall be submitted by the Contractor with each Value Engineering Proposal:

1. A description of the difference between the existing Contract requirement and the proposed change and the comparative advantages and disadvantages of each.
2. An itemization of the requirements of the Contract which must be changed and a recommendation of how to make such change (e.g., a suggested revision).
3. A detailed estimate of the cost of performing the work under the Contract and under the proposed change.
4. A prediction of any effects the proposed changes would have on other costs to the Department, including cost of related items and costs of maintenance and operation.
5. A statement of the time showing the last date by which an agreement for adoption of the proposed changes must be executed in order to obtain the maximum cost reduction during the remainder of the Contract, noting any effect on the Contract completion time or delivery schedule.
6. The dates of any previous or concurrent submissions of the Proposal, the Contract number(s) under which submitted, and the outcome or the result of the proposal in previous projects and any previous actions by the Department, if known.
7. A life-cycle cost analysis.

NOTE: If a VEP is similar to a change in the Plans or Specifications for the Project that is under consideration by the Department at the time said VEP is submitted, or if such VEP is based upon or similar to Standard Specifications, Special Provisions, or Standard Plans adopted by the Department after the advertisement of the Contract, the Engineer will not accept such proposal and the Department reserves the right to make such changes without compensation to the Contractor under the provisions of this Section.

Proposed changes in the basic design of a pavement type (e.g., rigid to flexible or vice versa) or pavement thickness will not be considered as an acceptable VEP. Proposed changes to base/subbase courses may be considered as an acceptable VEP. If design alternates are shown in the plans, the Department will not consider a VEP substituting a design alternate on which the Contractor could have bid for one on which the Contractor has bid. The Department reserves the right to reject any VEP submitted requiring additional Right-of-Way.

C. Submission

Value Engineering Proposals submitted by the Contractor will be processed as expeditiously as possible; however, the Department will not be liable for any delay in acting upon proposals submitted. The Contractor may withdraw, wholly or in part, any VEP not accepted by the Department within the time specified in Subsection 104.08.B.5.

D. Acceptance

The decision of the Engineer as to the acceptance or rejection of a VEP shall be final and shall not be subject to the provisions of Subsection 105.13, "Claims for Adjustments and Disputes."

The Engineer may accept, in whole or in part, before work has been completed, any VEP submitted pursuant to this Subsection and not withdrawn by the Contractor by giving the Contractor written notice thereof reciting acceptance under this Subsection.

E. Notification

The Contractor will be notified in writing of the Department's decision or rejection of each VEP submitted under these provisions. If a proposal is accepted, the necessary Contract modifications will be affected by execution of a Supplemental Agreement. Unless and until a VEP is affected by such Supplemental Agreement, the Contractor shall remain obligated to perform The Work in accordance with the terms of the existing Contract.

Supplemental Agreements made as a result of this Subsection will state that they are made pursuant to it.

F. Sharing

In the event a VEP submitted by the Contractor under this Subsection is accepted, the Supplemental Agreement effecting the necessary modifications will establish the net savings agreed upon and will provide for an adjustment in Contract Prices that will divide the net savings between the Contractor and the Department in accordance with the following provisions:

1. Division of net savings in Contract Price Adjustment:
 - 50 percent of the net savings to the Contractor.
 - 50 percent of the net savings to the Department.
2. The Department reserves the right to include in the agreement any conditions it deems appropriate for consideration, approval, and implementation of the VEP. The Contractor's 50 percent of the net savings shall constitute the full compensation for effecting all changes pursuant to the agreement.

Development costs incurred by the Contractor and review costs incurred by the Department shall not be considered in computing the net savings of the VEP.
3. Restrictions and Disclosures: Upon acceptance and implementation of any VEP, any restrictions imposed by the Contractor on its use or disclosure of the information submitted shall be void.

The Department shall thereafter have the right to use, duplicate, and disclose, in whole or in any part, all data necessary in the utilization of the proposal.

Section 105—Control of Work

105.01 Authority of the Engineer

The Engineer will decide all questions that may arise as to the quality and acceptability of materials furnished, work performed, and the rate of progress of The Work; the interpretation of the Plans and Specifications, and all questions as to the acceptable fulfillment of the Contract on the part of the Contractor. The Engineer will determine the quantities of the several kinds of work performed and materials furnished which are to be paid for under the Contract and his determination shall be final.

The Engineer will have the authority to suspend The Work wholly or in part due to the failure of the Contractor to correct conditions unsafe for the workmen or general public; for failure to carry out provisions of the Contract, or for failure to carry out orders; for such periods as he may deem necessary due to unsuitable weather; for conditions considered unsuitable for the prosecution of The Work; or for any other condition or reason deemed to be in the public interest.

The Contractor may request and will receive written instructions from the Engineer upon any important items.

After the Contract has been executed, and before work begins, the Engineer may designate a time and place to hold a Preconstruction Conference with the Contractor. At such time, the Contractor shall furnish the Engineer with a Progress Schedule as provided in Subsection 108.03 unless this schedule has been specifically exempted by Special Provision. The Contractor will also be given a decision on any alternate Traffic Control Plan that he may have previously submitted.

Any matters pertaining to order of work, interpretation of Plans and Specifications, traffic control, utility adjustments, or others, may be discussed at the Preconstruction Conference.

105.02 Plans and Working Drawings

Plans will show details of all structures, lines, grades, typical cross sections of the roadway, location and design of all structures, and a summary of Items appearing in the Proposal.

The Plans will be supplemented by such working drawings as are necessary to adequately control the Work. Working drawings for structures shall be furnished by the Contractor and shall consist of such detailed Plans as may be required to adequately control The Work and which are not included in the Plans furnished by the Department. They shall include stress sheets, shop drawings, erection plans, falsework plans, cofferdam plans, bending diagrams for reinforcing steel or any other supplementary plans, or similar data required of the Contractor. All working drawings must be approved by the Engineer and such approval shall not operate to relieve the Contractor of any responsibility under the contract for the successful completion of The Work. The Contract Bid Prices shall include the cost of furnishing all working drawings.

105.03 Conformity with Plans and Specifications

All Work performed and all materials furnished shall be in reasonably close conformity with the lines, grades, cross sections, dimensions, and material requirements, including tolerances, shown on the Plans or indicated in the Specifications.

Plan dimensions and contract Specification values are to be considered as the target values to be strived for and complied with as the design values from which any deviations are allowed. It is the intent of the Specifications that the materials and workmanship shall be uniform in character and shall conform as nearly as realistically possible to the prescribed target value or to the middle portion of the tolerance range. The purpose of the tolerance range is to accommodate occasional minor variations from the median zone that are unavoidable for practical reasons. When either a maximum and minimum value or both are specified, the production and processing of the material and the performance of the work shall be so controlled that material or work will not be preponderantly of borderline quality or dimension.

In the event the Engineer finds the materials or the finished product in which the materials are used not within reasonably close conformity with the Plans and Specifications, but that reasonably acceptable work has been produced, the Engineer shall then make a determination if the work shall be accepted and remain in place. In this event, except in cases where the appropriate price adjustments are provided for in the Specifications covering the materials and/or the finished product, a Supplemental Agreement will be executed documenting the basis of acceptance that will provide for an appropriate price adjustment in the Contract Price for such work or materials as the Engineer deems necessary to conform to his determination based on engineering judgement.

In the event the Engineer finds the materials or the finished product in which the materials are used or the work performed are not in reasonably close conformity with the Plans and Specifications, and have resulted in an inferior or unsatisfactory product, the work or materials shall be removed and replaced or otherwise corrected by and at the expense of the Contractor.

105.04 Coordination of Plans, Specifications, Supplemental Specifications, and Special Provisions

These *Standard Specifications*, the Supplemental Specifications, the Plans, Special Provisions, and all supplementary documents are essential parts of the Contract, and a requirement occurring in one is as binding as though occurring in all. They are intended to be complementary and to describe and provide for a complete work.

In cases of discrepancy, the governing descending order will be as follows:

1. Special Provisions
2. Project Plans including Special Plan Details
3. Supplemental Specifications
4. Standard Plans including Standard Construction Details
5. Standard Specifications

Calculated dimensions will govern over scaled dimensions.

The Contractor shall take no advantage of any apparent error or omission in the Plans or Specifications. In the event the Contractor discovers such an error or omission, he shall immediately notify the Engineer. The Engineer will then make such corrections and interpretations as may be deemed necessary for fulfilling the intent of the Plans and Specifications.

A. Specifications of Other Organizations

When work is specified to be done or when materials are to be furnished according to the published specifications of organizations other than the Department, the latest specifications published by those organizations at the time bids are received shall apply unless otherwise specified.

AASHTO Interim Specifications and ASTM Tentative Specifications will be considered effective on date of issue.

B. Item Numbers

The first three digits of any Item Number in the itemized Proposal designates the Specification section under which the Item shall be constructed.

105.05 Cooperation by Contractor

The Contractor will be supplied with a minimum of two sets of approved Plans and Contract assemblies including Special Provisions, one set of which the Contractor shall keep available on the project site at all times.

The Contractor shall give The Work the constant attention necessary to facilitate the progress thereof, and shall cooperate with the Engineer, Inspectors, and other Contractors in every way possible.

The Contractor shall have accessible to the Engineer at all times, as his agent, a competent Superintendent, capable of reading and thoroughly understanding the Plans and Specifications, and thoroughly experienced in the type of work being performed, who shall receive instructions from the Engineer or his authorized representatives. The Superintendent shall have full authority to execute orders or directions of the Engineer without delay and to promptly supply such materials, equipment, tools, labor, and incidentals as may be required. Such superintendence shall be furnished irrespective of the amount of work sublet.

The Superintendent shall notify the Engineer prior to starting any Pay Item Work. The Prime Contractor shall coordinate and be responsible to the Engineer for all activities of subcontractors.

105.06 Cooperation with Utilities

The Department will notify all utility companies, all pipeline owners, all railroad companies, or other parties affected of Award of the Contract, giving the name and address of the Contractor, and will assist the Contractor in arranging for all

necessary adjustments of the public or private utility fixtures, pipe lines, and other appurtenances within or adjacent to the limits of construction.

Water lines, gas lines, wire lines, service connections, water and gas meter boxes, water and gas valve boxes, light standards, cableways, signals, railroad facilities, and all other utility appurtenances within the limits of the proposed construction which are to be relocated or adjusted are to be moved by the owners at their expense, except as otherwise provided for elsewhere in the Contract.

It is understood and agreed that the Contractor has considered in his bid all of the permanent and temporary utility appurtenances in their present location or relocated positions, and that no additional compensation will be allowed for any delays, inconvenience, or damage sustained by him due to any interference from said utility appurtenances or the operation of moving them. Delays and interruptions to the controlling Item or Items of The Work are covered in Subsection 107.21.G.

It shall be the Contractor's responsibility to plan with each utility owner a schedule of operations which will clearly set forth at which stage of the Contractor's operations the utility owner will be required to perform his removal and relocation work.

105.07 Cooperation Between Contractors

The Department reserves the right at any time to Contract for and perform other or additional work on or near The Work covered by the Contract.

When separate Contracts are let within the limits of any one Project, each contractor shall conduct his work so as not to interfere with or hinder the progress or completion of The Work being performed by other Contractors. Contractors working on the same Project shall cooperate with each other.

Each Contractor involved shall assume all liability, financial or otherwise, in connection with his Contract and shall protect and save harmless the Department from any and all damages or claims that may arise because of inconvenience, delay, or loss experienced by him because of the presence and operations of other Contractors working within the limits of the same Project.

The Contractor shall arrange his work and shall place and dispose of the materials being used so as not to interfere with the operations of the other contractors within the limits of the same Project. He shall join his work with that of the others in an acceptable manner and shall perform it in proper sequence to that of the others. At the request of the Structure Contractor, the Engineer will designate an area within the right-of-way, adjacent to each structure, to be reserved for use by the Structure Contractor for Storage of Equipment and Materials necessary to construct the particular structure. So long as he occupies this area, the Structure Contractor shall be responsible for its maintenance. The Structure Contractor must relinquish this area, however, as it becomes practical to utilize completed portions of the structure.

105.08 Construction Stakes, Lines and Grades

(Subsection 105.08 Omitted)

105.09 Authority and Duties of the Resident Engineer

The Resident Engineer, regardless of his administrative title, is the Engineer designated by the Department to be the direct representative of the Chief Engineer. The Resident Engineer has immediate charge of the engineering details of each construction Project, and is responsible for contract administration. Such administration includes the designation of subordinates to represent him and make routine decisions. The Resident Engineer has the authority to reject defective material and to suspend any work that is being improperly performed.

105.10 Duties of the Inspector

Inspectors employed by the Department are authorized to inspect all work done and materials furnished. Such inspection may extend to all or any part of The Work and to the preparation, fabrication, or manufacture of the materials to be used. The Inspector will not be authorized to alter or waive the provisions of the Contract. The Inspector will not be authorized to issue instructions contrary to the Plans and Specifications or to act as foreman for the Contractor.

105.11 Inspection of the Work

All materials and each part of the detail of The Work shall be subject to inspection by the Engineer.

The Engineer shall be allowed access to all parts of The Work and shall be furnished with such information and assistance by the Contractor as is required to make a complete and detailed inspection.

Upon the Engineer's request, the Contractor, at any time before Final Acceptance of the project, shall remove or uncover such portions of the finished work as may be directed. After examination, the Contractor shall restore said portions of The Work to the standard required by the Specifications. Should The Work thus exposed or examined prove acceptable, the uncovering or removing and the replacing of the covering or making good of the parts removed will be paid for as Extra Work; but should the work so exposed or examined prove unacceptable, the uncovering, or removing and the replacing of the covering or making good of the parts removed will be at the Contractor's expense.

Any work done or materials used without supervision or inspection by an authorized Department representative may be ordered removed and replaced at the Contractor's expense, unless the Department representative failed to inspect after having been given reasonable notice in writing that The Work was to be performed.

When any unit of government or political subdivision or any railroad corporation is to pay a portion of the cost of The Work covered by the Contract, its respective representatives shall have the right to inspect The Work. Such inspection shall in no sense make any unit of government or political subdivision or any railroad corporation a party to the Contract and shall in no way interfere with the rights of either party hereunder.

105.12 Removal of Unacceptable and Unauthorized Work

All work that does not conform to the requirements of the Contract will be considered unacceptable unless otherwise determined acceptable under the provisions in Subsection 105.03.

Unacceptable work, whether the result of poor workmanship, use of defective materials, damage through carelessness, or any other cause found to exist prior to the Final Acceptance of The Work, shall be removed immediately and replaced in an acceptable manner.

Except as elsewhere noted, no work shall be done without lines and grades having been given by the Engineer. Work done contrary to the instructions of the Engineer, work done beyond the lines shown on the Plans or as given, except as herein specified, or any Extra Work done without authority will be considered as unauthorized and will not be paid for under the provisions of the Contract. Work so done may be ordered removed or replaced at the Contractor's expense.

Upon failure on the part of the Contractor to comply forthwith with any order of the Engineer made under the provisions of this section, the Engineer will have authority to cause unacceptable work to be remedied or removed and replaced and to cause unauthorized work to be removed, and to deduct the costs from any monies due or to become due the Contractor.

105.13 Claims for Adjustments and Disputes

Whenever the Contractor believes that it is or will be entitled to additional compensation, whether due to delay, extra work, breach of contract, or other causes, the Contractor shall follow the procedures set forth in this Sub-Section.

A. Claims For Acceleration

The Department shall have no liability for any constructive acceleration. If the Department gives express written direction for the Contractor to accelerate its effort, then both parties shall execute a Supplemental Agreement as provided in Subsection 104.03.

B. Claims For Delay and All Other Claims Except Acceleration

1. The Department shall have no liability for damages beyond those items which are specifically payable under this Sub-Section.
2. The Department will be liable only for those delay damages caused by or arising from acts or omissions on the part of the Department which violate legal or contractual duties owed to the Contractor by the Department. The Contractor assumes the risk of damages from all other causes of delay.

3. The parties recognize that delays caused by or arising from right of way problems, defects in plans or design, redesign, changes in The Work by the Department, the actions of suppliers or other Contractors, the shop-drawing approval process, injunctions, court orders and other such events, forces or factors are commonly experienced in highway construction work. Such delays shall not constitute breaches of the Contract. However, such delays may constitute a basis for a claim for delay damages, if found to be in accordance with Subsection 105.13.B.2 above and other provisions of the Contract, and/or a request for a time extension.
4. The term "delay" shall be deemed to mean any event, action, force or factor which extends the Contractor's time of performance. This Subsection is intended to cover all such events, actions, forces or factors, whether they be styled "delay," "disruption," "interference," "impedance," "hindrance", "impact" or otherwise.
5. Compliance with the provisions of Subsection 105.13 will be an essential condition precedent to any recovery of damages by the Contractor.
6. The following items, and only the following items, may be recoverable by the Contractor as "damages":
 - a. Additional direct hourly rates paid to employees for job site labor, including payroll taxes, welfare, insurance, benefits and all other labor burdens.
 - b. Documented additional costs for materials.
 - c. Additional equipment costs, as determined in accordance with this Sub-Section.
 - d. Documented costs of extended job-site overhead. (Not applicable for claims other than delay claims.)
 - e. An additional 15 percent of the total of Subsections 105.13.B.6. a, b, c and d, which sum includes home office overhead and profit.
 - f. Bond costs.
 - g. Subcontractor costs, as determined by, and limited to, those items identified as payable under [Subsection 105.13.B.6. a, b, c, d, e, and f.](#)
7. For purposes of computing additional equipment costs, rates used shall be based on the Contractor's actual experienced cost for each piece of equipment. These rates shall be supported by equipment cost records furnished by the Contractor. In no case will equipment rates be allowed in excess of 70% of those determined utilizing the "Rental Rate Blue Book," with the appropriate adjustments noted in Subsection 109.05
8. The parties agree that, in any claim for damages, the Department will have no liability for the following items of damages or expense:
 - a. Profit, in excess of that provided herein.
 - b. Loss of profit.
 - c. Labor inefficiencies, except as allowed under Subsection 105.13.B.6.a.
 - d. Home office overhead in excess of that provided herein.
 - e. Consequential damages, including but not limited to loss of bonding capacity, loss of bidding opportunities and insolvency.
 - f. Indirect costs or expenses of any nature.
 - g. Attorneys fees, claims preparation expenses, or costs of litigation.
 - h. Interest of any nature.
9. NOTICE OF POTENTIAL CLAIM: In any case in which the Contractor believes that it will be entitled to additional compensation, the Contractor shall notify the Engineer in writing of its intent to claim such additional compensation. Such notice shall be given in order that the Department can assess the situation, make an initial determination as to who is responsible, and institute appropriate changes or procedures to resolve the matter.
 - a. Claims for Delay - The Department shall have no liability for any delay which occurred more than one week prior to the filing of such written notice. Failure of the Contractor to give such written notice in a timely fashion will be grounds for denial of the claim.
 - b. All Other Claims Except Acceleration and Delay - If the Contractor does not file such written notice before beginning the work out of which such claim arises, then the Contractor hereby agrees that it shall have waived any additional compensation for that work and the Contractor shall have no claim thereto.

10. RECORDS: After filing a "Notice of Potential Claim", the Contractor shall keep daily records of all labor, material, and equipment costs incurred for operations affected. These daily records shall identify each operation affected and the specific locations where work is affected. The Department will also keep records of all labor, material, and equipment used on operations affected. At the time and place, as designated by the Engineer, on Monday, or the first work day, of each week following the date of filing a "Notice of Potential Claim", the Contractor shall meet with the Department's representative and present the daily records for the preceding week. If the Contractor's records indicate costs greater than those kept by the Department, the Department will present its records to the Contractor. The Contractor shall notify the Engineer in writing within three (3) work days of any inaccuracies noted in, or disagreements with, the Department's records. Refusal or repeated failure by the Contractor to attend these weekly meetings and present its records will constitute a waiver by the Contractor of any objections as to the accuracy of the Department's records. When the Contractor makes an objection as to the accuracy of the Department's records, the Engineer shall review the matter, and correct any inaccuracies he finds in the Department's records. For purposes of computing damages, the Department's records will control.

In the event the Contractor wishes to contest the accuracy of the Department's records, it may file a petition pursuant to Rule 672-1-.05 of the Official Rules and Regulations of the Department of Transportation. The decision of the Engineer, or, if contested, the decision of the Agency, will be final and binding upon the parties as to any objections to the accuracy of the Department's records, subject to the Contractor's right to judicial review under O.C.G.A. Section 50-13-19.

11. On a weekly basis after filing a "Notice of Potential Claim" for delay damages, the Contractor shall prepare and submit to the Engineer written reports providing the following information:
- a. Potential effect to the schedule caused by the delay.
 - b. Identification of all operations that have been delayed, or are to be delayed.
 - c. Explanation of how the Department's act or omission delayed each operation, and estimation of how much time is required to complete the project.
 - d. Itemization of all extra costs being incurred, including:
 - 1) An explanation as to how those extra costs relate to the delay and how they are being calculated and measured.
 - 2) Identification of all project employees for whom costs are being compiled.
 - 3) Identification of all manufacturer's numbers of all items of equipment for which costs are being compiled.

C. Required Contents of Claims

All claims shall be submitted in writing, and shall be sufficient in detail to enable the Engineer to ascertain the basis and the amount of each claim. The claim submission shall include six (6) printed copies and one (1) digital copy on Recordable disk. All information submitted to the Department under this Subsection will be used exclusively for analyzing the claim, resolving the claim or any litigation which might arise from the claim. At a minimum, the following information shall be provided:

1. A description of the operations that were delayed, the reasons for the delay, how they were delayed, including the report of all scheduling experts or other consultants, if any. (Not applicable for claims other than delay claims)
2. An as-built chart, CPM scheme or other diagram depicting in graphic form how the operations were adversely affected. (Not applicable for claims other than delay claims except where an extension of time is sought)
3. A detailed factual statement of the claim providing all necessary dates, locations and items of work affected by the claim.
4. The date on which actions resulting in the claim occurred or conditions resulting in the claim became evident.
5. A copy of the "Notice of Potential Claim" filed for the specific claim by the Contractor.
6. The name, function, and activity of each Department official, or employee, involved in, or knowledgeable about facts that gave rise to such claim.
7. The name, function, and activity of each Contractor or Subcontractor official, or employee, involved in, or knowledgeable about facts that gave rise to such claim.
8. The identification of any pertinent documents, and the substance of any material oral communication relating to such claim.
9. A statement as to whether the additional compensation or extension of time sought is based on the provisions of the Contract or an alleged breach of Contract.

10. The specific provisions of the Contract which support the claim, and a statement of the reasons why such provisions support the claim.
11. The amount of additional compensation sought and a break-down of that amount into the categories specified as payable under Subsection 105.13.B.6, above.
12. If an extension of time is also sought, the specific days for which it is sought and the basis for such request.

D. Required Certification of Claims

When submitting the claim, the Contractor shall certify in writing, under oath in accordance with the formalities required by Georgia law, as to the following:

1. That the claim is made in good faith.
2. That supportive data are accurate and complete to the Contractor's best knowledge and belief that the amount of the claim accurately reflects what the Contractor in good faith believes to be the Department's liability.

The Contractor shall use the CERTIFICATE OF CLAIM form, which can be obtained from the Department, in complying with these requirements.

E. Auditing of Claims

All claims filed against the Department shall be subject to audit at any time following the filing of such claim, whether or not such claim is part of a suit pending in the courts of this State. The audit may be performed by employees of the Department or by an independent auditor on behalf of the Department. The audit may begin on ten days notice to the Contractor, Subcontractor, or Supplier. The Contractor, Subcontractor, or Supplier shall make a good faith effort to cooperate with the auditors. Failure to cooperate with the auditor shall constitute a waiver by the Contractor of the claim in its entirety. Failure of the Contractor, Subcontractor, or Supplier to maintain and retain sufficient records to allow the Department's auditor to verify the claim shall constitute a waiver of that portion of such claim that cannot be verified and shall bar recovery thereunder. If the claim is part of a suit pending in a court of this state or if the claim becomes a part of a suit in a court of this state, the questions of whether the Contractor has cooperated with the auditor or failed to maintain and retain sufficient records to allow the auditor to verify the claim shall be questions for determination by the judge without the assistance of a jury.

Without limiting the generality of the foregoing, and as a minimum, the auditors shall have available to them the following documents:

1. Daily time sheets and foreman's daily reports.
2. Project payroll register.
3. Profit and loss statements for the Project.
4. Payroll tax returns.
5. Material invoices, purchase orders, and all material and supply acquisition contracts for the Project.
6. Material cost distribution worksheet for the Project.
7. Equipment records (list of company equipment, rates, etc.)
8. Vendor rental agreements, and subcontractor invoices.
9. Subcontractor payment certificates.
10. Canceled checks (payroll and vendors) for the Project.
11. Job cost report for the Project.
12. Job payroll ledger for the Project.
13. General ledger, general journal, (if used) and all subsidiary ledgers and journals together with all supporting documentation pertinent to entries made in these ledgers and journals.
14. Cash Disbursements journal for the Project.
15. Certified financial statements for all years reflecting the operations on this project.
16. Depreciation records on all company equipment whether such records are maintained by the company involved, its accountant, or others.
17. If a source other than depreciation records is used to develop costs for the Contractor's internal purposes in establishing the actual cost of owning and operating equipment, all such other source documents.
18. All documents which relate to each and every claim together with all documents which support the amount of damages as to each claim.

19. Worksheets used to prepare the claim establishing the cost components for items of the claim including, but not limited to, labor, benefits and insurance, materials, equipment, subcontractors, and all documents which establish the time periods, individuals involved, the hours and the rates for the individuals.

F. Mediation

After compliance by the Contractor with parts B., C., D. and E. of Subsection 105.13 and if the Contractor's claim has been disallowed in whole or in part, then the Contractor may, within 30 calendar days from receipt of the ruling of the Engineer, make a written request to the Engineer that the claim or claims be referred to mediation.

If requested in accordance with this specification, mediation shall be granted by the Department. In which case, within 30 days of receipt by the Department of the Contractor's request for mediation, the Contractor and the Department will meet to select a mediator. The mediator will then schedule the mediation at a place, time, and earliest date agreeable to the Contractor and the Department.

The Contractor and the Department mutually agree that mediation shall be a condition precedent to the filing of any lawsuit concerning claims or alleged breaches of the Contract. The costs and expenses of the mediator, selected by mutual agreement of the parties, will be divided equally between the Department and the Contractor. Each party to the mediation shall bear its own costs of preparing for and participating in the mediation.

G. Remedies Exclusive

In the event any legal action is instituted against the Department by the Contractor on account of any claim for additional compensation, whether on account of delay, acceleration, breach of contract, claimed extra work, or otherwise, the Contractor agrees that the Department's liability will be limited to those items which are specifically identified as payable in Sub-Section 105.13.

105.14 Maintenance During Construction

The Contractor shall maintain the project during construction and until the Project is accepted. This maintenance shall constitute the continuous and effective work prosecuted day by day, with adequate equipment and forces to the end that all areas of the project are kept in satisfactory condition at all times.

The Contractor's area of responsibility for maintenance is confined to the physical construction limits plus any areas affected by the Contractor's activities. Once maintenance acceptance or final acceptance has been made, the Contractor is no longer responsible for damage to The Work other than that attributable to the Contractor's actions or inadequate construction.

In case of separate contracts, each Contractor shall be responsible for any damage to the completed work of others caused by his actions or negligence. Where the work of one Contractor has been accepted by the Department, the Contractor performing subsequent work in the area shall be responsible for the maintenance and protection of all work previously completed.

If separate bridge contracts are let within the limits of a Roadway Project and the Bridge Contractor completes his Contract before the Roadway Contractor, the Bridge Contract may be accepted and the Roadway Contractor will be responsible for maintenance of the new bridge until it is opened to traffic. If the Roadway Contractor hauls materials across the bridge the Roadway Contractor shall protect the endposts, deck surface, deck edges, joints, and all other vulnerable features of the bridge by use of adequate timber or earth cushions as directed by the Engineer. The Roadway Contractor shall repair all damage caused by such use, including resealing of joints and rerubbing of finish at his own expense.

All cost of maintenance work during construction and before the Project is accepted shall be included in the Unit Prices Bid on the various Pay Items and the Contractor will not be paid an additional amount for such work except as provided in Subsection 104.05.B.

The Contractor shall not allow vegetative growth at any time to obstruct signs, delineation, traffic movements, or sight distance. The Contractor shall at intervals not to exceed six months, clean up and remove litter and debris; remove weeds from around guardrail, barrier, poles, standards, utility facilities, and other structures; and cut or trim trees, bushes or tall grass. These requirements shall apply to all areas within the project termini and lateral limits.

105.15 Failure to Maintain Roadway or Structures

If at any time, the Contractor fails to comply with the provisions of Subsection 105.14, the Engineer will immediately notify the Contractor of such noncompliance. If the Contractor fails to remedy the unsatisfactory maintenance within 48 hours after receipt of such notice, the Engineer may immediately proceed to maintain The Work, and the entire cost of this maintenance will be deducted from monies due or to become due the Contractor under the Contract. As an alternative to the Engineer's maintaining the Work, all the Items and quantities of work done, but not properly maintained, may be deducted from the current progress estimate, even if such Items have been paid for in a previous estimate.

105.16 Final Inspection and Acceptance

Upon due written notice from the Contractor of substantial completion of the entire Project, the Engineer will determine if the Project is ready for a Final Inspection. The Engineer will have the final decision on when the Project is substantially complete and thereby ready for a Final Inspection. If the Engineer finds the Project substantially complete the Engineer will schedule the Final Inspection. If all construction provided for and contemplated by the Contract is found completed to the Engineer's satisfaction and all documents required in connection with the Project have been submitted by the Contractor, the Engineer will make the Final Acceptance and notify the Contractor in writing of this acceptance.

If, however, the Final Inspection discloses any work, in whole or part, as being unsatisfactory, the Engineer will provide the Contractor with a written punch-list that includes the necessary instructions for correction of same. The punch-list will also include any remaining work to be completed and any final reports and other documentation required to be submitted by the Contractor. The Contractor shall immediately comply with and execute such instructions. When all construction provided for and contemplated by the Contract is found completed to the Engineer's satisfaction, including submission of any required documentation, the Engineer will make the Final Acceptance and notify the Contractor in writing of this acceptance.

When the Contractor has finished a major portion of the Contract, the Contractor may request that a semi-final inspection be made. At the discretion of the Engineer, who shall be sole judge as to making the inspection, if the work is satisfactory, as described in the first paragraph of this Section, that portion of the Contract may be accepted, opened to traffic, if not already carrying traffic, and the Contractor relieved of the maintenance obligations as described elsewhere in these Specifications.

Such partial acceptance shall in no way relieve the Contractor of responsibility for satisfactory completion of the Contract, or for failure of any portion of the accepted work prior to Final Acceptance of the Project.

Section 106—Control of Materials

106.01 Source of Supply and Quantity of Materials

The materials used in The Work shall meet all quality requirements of the Contract. Materials will not be considered as finally accepted until all tests, including any to be taken from the finished Work have been completed and evaluated. To expedite the inspection and testing of materials, the Contractor shall notify the Engineer in writing of his proposed sources of materials at least 2 weeks before delivery, or earlier if blend determinations or mix designs are required. When required, representative preliminary samples of the character and quality prescribed shall be submitted for examination and testing. The approval of preliminary samples does not obligate the Engineer to accept materials from the same source delivered later. If, after trial, it is found that sources of supply for previously approved materials do not produce uniform and satisfactory products, or if the product from any source proves unacceptable at any time, the Contractor shall furnish materials from other sources. The Engineer shall have the right to reject the entire output of any source from which he finds it is impractical to secure a continuous flow of uniformly satisfactory material.

Upon request by the Department, the Contractor shall furnish formal written invoices from the materials suppliers.

The invoice shall show the date shipped, the quantities, and the unit prices.

The Contractor shall purchase materials from suppliers who are willing for the Contractor to furnish the Department copies of invoices as noted herein upon request by the Department.

Materials used and operations performed under Section 400- Hot Mix Asphaltic Concrete Construction, shall be controlled and tested by the Contractor. This shall be done in such a manner as to produce a uniform product that meets Specification

requirements. In the event the Contractor's quality control procedures do not achieve the desired objective, operations shall be suspended until satisfactory results are obtained.

The Contractor's quality control personnel shall be properly instructed and trained to perform all tests and make calculations, and shall be competent to control all processes so that the requirements are met.

106.02 Unacceptable Material

All material not conforming to the requirements of the Specifications will be considered as unacceptable. All unacceptable materials, whether in place or not, will be rejected and shall be removed immediately from the site of The Work unless otherwise directed by the Engineer. In case of failure by the Contractor to comply promptly with any order by the Engineer to remove rejected materials, the Engineer shall have authority to have such rejected materials removed by other means and to deduct the expense of such removal from any monies due, or to become due, to the Contractor. No rejected materials, the defects of which have been corrected, shall be used until the Engineer has given approval.

106.03 Samples, Tests, Cited Specifications

All materials will be inspected, tested, and approved by the Engineer before incorporation into The Work. Samples will be taken by a qualified representative of the Department. Unless otherwise designated, tests will be made by and at the expense of the Department and in accordance with methods of AASHTO, ASTM, or the published Specifications of any other designated organization that are current on the date of advertisements for bids. Copies of all tests will be furnished to the Contractor's representative at his request. Sampling and testing by the Department will be performed in accordance with the *Sampling, Testing and Inspection Manual*.

For work [performed under](#) Section 400- Hot Mix Asphaltic Concrete Construction all materials shall be inspected and tested by the Contractor before incorporation into The Work. The Contractor's Quality Control Technician shall sample and test all quality control samples. The Contractor's quality control tests may be used as acceptance tests at the discretion of the Engineer. Sampling and testing by the Contractor shall be performed according to the Sampling, Testing, and Inspection Manual. Copies of all tests performed by the Contractor shall be furnished to the Engineer and will become a part of the project records. The Department will be responsible only for determining the acceptability of the construction and materials incorporated therein. The Contractor shall be responsible for the quality of the construction and materials incorporated therein. The Department will monitor the Contractor's Quality Assurance Acceptance Program to verify test accuracy.

A. Testing and Acceptance Plans

1. **A Lot:** Work will be accepted on a Lot-to-Lot basis in accordance with the requirements specified in the Acceptance Plans specified in Section 400- Hot Mix Asphaltic Concrete Construction. Lot sizes will normally be specified. In the event, however, that operational conditions cause work to be interrupted, or only partially completed before the Lot size specified has been achieved, the Lot may be redefined by the Engineer as being either the amount of work accomplished within the day, or he may combine that work with the next Lot of work. A Lot is set forth in these Specifications as a defined quantity of a specified material from a single source or a measured amount of specified construction assumed to be produced by the same process.
2. **Acceptance Plans:** The Acceptance Plan for a material, product, or an Item of construction, or completed work will be as specified hereinafter in Section 400 and Section 430 of these Specifications. However, in addition to the following conditions, the Department reserves the right to test any additional material for work that appears defective and to require correction if necessary prior to Final Acceptance of the Project.
3. **Resampling of Lots:** It is the intent of these Specifications that Lots of materials, products, Items of construction, or completed construction will meet Specification requirements at the time of submission. Resampling of deficient Lots as a basis for check tests may be done by the Engineer at his option.
Non-conforming Lots, which can be corrected by reworking, will not be re-sampled before such corrective action is taken. Sampling and testing of reworked areas shall be at the expense of the Contractor.
4. **Acceptance or Rejection:** Nonconforming Lots, materials, products, or Items of construction that are not adaptable to correction by reworking shall be removed and replaced, accepted without payment, or accepted at an adjusted price as stated in the Specifications, or if not stated, as directed by the Engineer.

Following the application of the Acceptance Plan, the decision of the Engineer shall be final as to the acceptance, rejection, or acceptance at an adjusted price of the Lots unless the Contractor elects to remove and replace any deficient materials or work at his expense.

5. **Adjusted Payment:**

- a. **Single Deficiency:** A single deficiency is defined as a deficiency involving one characteristic of a material within a Lot. In the case of single-characteristic deficiency, it shall be used directly to determine an adjusted Contract Price.
- b. **Multiple Deficiency:** A multiple deficiency is defined as deficiencies involving more than one characteristic of construction within a Lot. In the case of multiple deficiencies, the related adjusted percentage of Contract Price for each characteristic shall be determined and the greatest reduction in price shall be used to determine the Contract Unit Price to be paid. Should the total adjustment for any individual Lot be 50 percent or more, the Engineer will determine whether the deficient Lot should be removed and replaced or allowed to remain in place. No payment will be made for the original Lot or for its removal. Replacement of the Lot will be paid for in accordance with the provisions for the Item.

106.04 Plant Inspection

At the option of the Engineer, materials may be sampled and tested at the source of supply. In the event plant inspection is undertaken, the following conditions shall be met:

- A. The Engineer shall have the cooperation and assistance of the Contractor as well as the Contractor's material supplier.
- B. The Engineer shall have full entry at all times to such parts of the plant as may concern the manufacture or production of the materials being furnished.
- C. If specified in the Proposal, the Contractor shall arrange for an approved building for the use of the inspector; such building to be located conveniently near the plant, independent of any building used by the material producer, and conforming to the requirements of Subsection 106.11 and Section 152.
- D. Adequate safety measures shall be provided and maintained. This shall include sampling valves on storage tanks for bituminous materials and safety stands for use in sampling from truck beds.
- E. It is understood that the Department reserves the right to retest all materials which, prior to incorporation into The Work, have been tested and accepted at the source of supply and after the same have been delivered. The Department further reserves the right to reject all materials which, when retested, do not meet the requirements of the Contract Specifications.

106.05 Materials Certification

For certain products, assemblies, and materials, in lieu of normal sampling and testing procedures by the Contractor and the Department, the Engineer may accept from the Contractor the manufacturer's certification with respect to the product involved, under the conditions set forth in the following paragraphs:

- A. The certification shall state that the named product conforms to the Department's requirements and that representative samples thereof have been sampled and tested as specified.
- B. The certification shall either:
 - 1. Be accompanied with a certified copy of the test results, or
 - 2. Certify that such test results are on file with the manufacturer and will be furnished to the Engineer upon demand.
- C. The certification shall give the name and address of the manufacturer and the testing agency and the date of tests, and shall set forth the means of identification which will permit field determination of the product delivered to the project as being the product covered by the certification.
- D. The certification shall be in duplicate with one copy to be sent with the shipment of the covered product to the Department's Project Engineer, and with one copy sent to Office of Materials, 15 Kennedy Drive Forest Park, Georgia 30297.

No Certificate will be required for Portland Cement when furnished from a manufacturer approved by the Department.
- E. The Department will not be responsible for any costs of certification or for any costs of the sampling and testing of products in connection therewith.

F. The Department reserves the right to require samples and to test products for compliance with pertinent requirements irrespective of prior certification of the products by the manufacturer. Any materials that fail to meet specification requirements will be rejected.

106.06 Agricultural Lime and Fertilizer

The sale and distribution of Fertilizers and Agricultural Lime are governed by Acts of the Georgia General Assembly and Rules and Regulations of the State Department of Agriculture.

Therefore, either of these materials may be sampled by authorized representatives of the State Commissioner of Agriculture. The Contractor may use these materials in The Work without sampling provided he notifies the Engineer 48 hours in advance of anticipated delivery to the job site. The Engineer reserves the right to request random sampling by a representative of the State Department of Agriculture.

The Contractor will not be expected to withhold application pending completion of tests, but will not be relieved of the responsibility for the quality of the material furnished. In the event a sample fails to meet the requirements of the Georgia Law as evidenced by a report furnished by the Commissioner of Agriculture, the Engineer will deduct from monies due to the Contractor a sum equal to the penalty authorized by the above referenced Act.

106.07 Sample Holes

All holes dug or drilled for the purpose of taking samples or determining thickness any time before Final Acceptance of the Project shall be repaired by the Contractor.

The material replaced shall be compacted and finished to the satisfaction of the Engineer. Costs of this work shall be included in the appropriate Bid Items.

106.08 Storage of Materials

Portions of the right-of-way, approved by the Engineer, may be used for material storage purposes and for the placing of the Contractor's plant and equipment. Additional space required must be provided by the Contractor at no additional expense to the Department. Private property shall not be used for storage purposes without written permission of the owner or lessee, and if requested by the Engineer, copies of such written permission shall be furnished.

Materials shall be stored to assure the preservation of their quality and fitness for The Work, and shall be located so as to facilitate their prompt inspection. Stored materials, even though approved before storage, may again be inspected before their use in The Work.

All storage sites shall be restored to their original condition by the Contractor at no additional expense to the Department.

No inflammable materials or harmful chemicals shall be stored within 200 ft (60 m) of a structure nor within 200 ft (60 m) of a roadway open to traffic. Such materials shall be stored in accordance with directions from the manufacturer.

106.09 Handling Materials

All materials shall be handled in such a manner as to preserve their quality and fitness for The Work. Aggregates, and mixtures of aggregates with other materials, shall be transported from the storage site to The Work in tight vehicles so constructed as to prevent loss or segregation of materials after loading and measuring in order that there may be no inconsistency in the qualities of the materials intended for incorporation into The Work as loaded and the qualities as actually received at the place of operation. The actual incorporation of the material in The Work shall be such that the quality and fitness of the material is retained and no segregation results.

106.10 Local Material Sources

A. Sources Shown on the Plans

Possible sources of local materials and/or disposal areas may be designated on the Plans. The quality of materials in such deposits will be acceptable in general but the Department does not warrant either the quality or the quantity of materials shown on the Plans. The Contractor shall determine the amount of equipment and work required to produce a material meeting the Specifications. Pit mixing, selective excavation, and other such operations shall be expected and the

Contractor shall determine the extent of these activities. It shall be understood that it is not feasible to ascertain from samples the limits for an entire deposit and that variations in quality and quantity shall be considered as usual and are to be expected.

1. When easements to secure local materials and/or disposal areas are obtained by the Department, the Plans will show the locations of the pits or areas, the amount of royalties and other costs and conditions of acquisition of the material. In all cases where the Department has secured easements for material pits and/or disposal areas, these easements will be assigned to the Contractor who shall make prompt payment to the owners of such pits for all royalty and crop damage costs for materials and/or areas, and who shall further fulfill all of the terms of the Easement. The Department does not warrant the title or any interest of the property owner in such Easements.
2. If the Contractor elects to use only a portion of the materials or area estimated to be available in any pit or disposal area, or only clears or partially clears the pit or area, and does not remove or deposit any material, he shall make a minimum payment to the property owner of at least 33-1/3 percent of the estimated value of the pit or areas as shown in the Easement, plus any crop damage costs called for by the Easement.

The Contractor shall, before receiving final payment from the Department, submit to the Engineer a written statement signed by the owner stating that the owner has been paid in full and that all conditions agreed to have been fulfilled to the satisfaction of the owner. The Department will not take any separate payment to the Contractor for these material acquisition costs except that reclamation of the pit or area, if required, will be paid for in accordance with Section 160.

Should the Contractor fail to pay the property owner within 60 days after ceasing to use the pit or area, the Department may pay directly to the property owner any amounts due and deduct same from any funds due the Contractor. This provision does not affect the obligation of the Contractor under his Bond or the rights of the property owner or the Department under the Bond.

B. Substitution of Sources of Materials

1. If, after the Contract is awarded, the Contractor wishes to substitute other sources for sources designated on the Plans, he may do so provided the material to be substituted conforms to the Specifications. The Contractor shall make all necessary arrangements with the property owners for removal of the material from substituted pits. Payment will be made for Clearing and Grubbing, Stripping Excavation, Pit Reclamation, and Ditch Excavation only to the extent required for pits shown in the Plans. This does not relieve the Contractor from planting a satisfactory cover crop of the type called for on the Plans or required by the Specifications on all scarred areas created by the removal of materials.

In the event the Contractor substitutes a source for soil-cement, soil-bituminous, or other material to be stabilized, and the Engineer determines that the substitute source requires more stabilizing agent than the Plan pit, no payment will be made for the additional stabilizing agent required.

2. Substitution sources will not be allowed where the resulting scars will present an unsightly appearance from any State or Federal highway.

C. Material Pits Furnished By the Contractor

When sources of any, or all, local materials are not shown on the Plans, or when location maps of possible sources of materials are shown on the Plans for information but no Easements are obtained, the Contractor shall provide sources of material meeting Contract requirements and acceptable to the Engineer. The Contractor shall make arrangements with the property owner regarding rights to remove material from the pits but prior to Final Acceptance of the Project by the State, the Contractor shall furnish the Engineer documentary proof of payment to the property owner for all materials as stated in Subsection 106.10.A.2 above. Under these circumstances, no separate payment will be made for Clearing and Grubbing, or Reclamation of Pits. Material sources shall not be excavated at locations where the resulting scars will present an unsightly appearance from any State or Federal highway. No payment will be made for material obtained in violation of this provision.

The Contractor shall provide a survey and sketch for all contractor-furnished material pits and haul road routes in accordance with the following:

The pit boundaries and haul road routes shall be selected and staked at 200 ft (60 m) intervals or as required by the Engineer. Minimum work shall include measurement of pit boundaries and haul road routes using a chain or stadia and

measurement of angles or bearings using a transit or a Brunton Compass. Pit boundaries and haul road routes shall be adequately marked and referenced to a centerline station number on the project.

D. Haul Roads

Unless specifically provided, no separate payment will be made to the Contractor for construction or maintenance of any roads constructed for hauling materials. The cost of constructing, maintaining, and revegetating, if necessary, these haul roads shall be included in the prices bid for the Pay Items pertaining to the part of The Work in which the materials are used. Other designated Haul Roads will be paid for in accordance with Section 233.

106.11 Field Laboratory

The Contractor may be required to provide a field laboratory on or near the Project consisting of a suitable building in which to house and use the equipment necessary to perform the required tests. The building, if required, will meet the requirements of and be paid for in accordance with Section 152.

At all permanent plants producing asphaltic concrete, Portland cement concrete or cement stabilized base course materials, a fully equipped plant laboratory shall be furnished at no expense to the Department.

106.12 Inspection for Non-Domestic Materials

A. Materials Manufactured Outside the United States

Materials which are manufactured outside the United States shall be delivered to a distribution point in the United States, where the materials shall be retained for a sufficient period of time to permit inspection, sampling, and testing. The Contractor, at no cost to the Department, shall furnish facilities and arrange for all testing as required by the Engineer to ensure that the materials comply with the Specifications. All such tests shall be made in the presence of the Engineer or his representative, and if the tests are performed outside of the boundaries of the State of Georgia and its contiguous area, the Contractor shall reimburse the Department for the expenses actually incurred by the Engineer or his representative in attending the tests.

B. Certified Mill Test Reports

Certified mill test reports shall be furnished for all materials obtained from foreign manufacturers. Such reports shall be printed in English and shall be clearly identifiable to the lot of material tested.

C. Materials from Foreign Manufacturers

Materials shall be furnished only from those foreign manufacturers who have previously established, to the satisfaction of the Engineer, the sufficiency of their in-plant quality control which will give satisfactory assurance of the manufacturer's ability to furnish material uniformly and consistently in compliance with the Specifications. Such sufficiency shall be established by detailed written evidence to the Engineer's satisfaction, or, if deemed necessary, through in-plant inspection by the Engineer or his representative; the cost of such inspection to be reimbursed by the Contractor.

D. Structural Steel Fabricated Outside the State of Georgia

In the event the Contractor elects to have items of structural steel fabricated outside the boundaries of the State of Georgia and its contiguous area, the Contractor shall reimburse the Department for the actual cost of the shop inspection of such fabrication in excess of the average inspection cost for shop inspection of fabrication within the State of Georgia and its contiguous area. Such actual costs of shop inspection may include the actual expenses incurred by the Engineer or his representative in making an in-plant inspection, arranging for an approved inspection agency to make the shop inspection, and the cost of the shop inspection by the approved inspection agency.

E. Department Reimbursement

In the event the Contractor fails to reimburse the Department promptly for any of the costs established by this provision, the Contractor agrees that the amount of such costs may be deducted from amounts of money owing to the Contractor on Monthly Estimates or Final Estimate.

F. Definitions

The following definitions shall apply to Subsection 106.12.

United States: The geographical area of the United States of America excluding its territories and possessions.

State of Georgia and Contiguous Area: The geographical area within the State of Georgia and those states which share a common border with the State of Georgia.

Average Inspection Cost: The average of the actual expenses incurred in making an inspection within the area designated as determined by the Engineer.

Foreign Manufacturer: A manufacturer of materials where the materials are manufactured outside the geographical area of the United States.

106.13 Out of State Materials Payment

Materials payments to Contractors who elect to have materials fabricated and stored outside the boundaries of the State of Georgia shall be made under the following guidelines.

The Contractor shall submit a written request to the Engineer for an inspection of out-of-state materials. This request shall state that the Contractor agrees to reimburse the Department for the actual cost of travel, subsistence, and extra expense incurred by the Department in the execution of this inspection and any subsequent inspection that may be necessary. This request shall be signed by a person legally responsible to bind the company and shall be notarized.

In the event the Contractor fails to reimburse the Department promptly for any of the costs established by this provision, the Contractor agrees that the amount of such costs may be deducted from amounts of money owing to the Contractor on Monthly Estimates or Final Estimate.

The above requirements are not applicable to the fabrication and materials payment for structural steel, prestress beams, precast bridge units, and piling for bridge construction within the states which share a common border with the State of Georgia.

Section 107—Legal Regulations and Responsibility to the Public

107.01 Laws to Be Observed

The Contractor shall keep fully informed of all Federal and State laws, all local laws, ordinances, codes, and regulations and all orders and decrees of bodies or tribunals having any jurisdiction or authority, which in any manner affect those engaged or employed on The Work, or which in any way affect the conduct of The Work. The Contractor shall at all times observe and comply with all such laws, ordinances, codes, regulations, orders, decrees, and permits; and shall protect and indemnify the Department and its representatives against any claim or liability arising from or based on the violation of any such law, ordinance, code, regulation, order, decrees, and permits, whether by himself, his employees, subcontractors, or agents.

107.02 Permits and Licenses

The Contractor shall procure all permits and licenses, pay all charges, taxes, and fees, and give all notices necessary and incidental to the due and lawful prosecution of The Work.

107.03 Patented Devices

If the Contractor employs any design, device, material, or process covered by letters of patent or copyright, he shall provide for such use by suitable legal agreement with the patentee or owner. The Contractor and the Surety shall indemnify and save harmless the Department from any and all claims for infringement by reason of the use of any such patented design, device, material, or process, or any trademark or copyright, and shall indemnify the Department for any costs, expenses, and damages which it may be obliged to pay by reason of any infringement, at any time during the prosecution or after the completion of The Work.

107.04 Restoration of Surfaces Opened By Permit

The right to construct or reconstruct any utility service in the highway or street and to grant permits for the same at any time, is expressly reserved by the Department for the proper authorities of the municipality or county in which The Work is done and the Contractor shall not be entitled to any damages either for the digging up of the street or highway, or for any delay occasioned thereby.

Any individual, firm, or corporation wishing to make an opening in the street or highway must secure a permit from the Department. The Contractor shall allow parties bearing such permits, and only those parties, to make openings in the street or highway. When ordered by the Engineer, the Contractor shall make in an acceptable manner all necessary repairs due to such openings and such necessary work will be paid for as Extra Work, or as provided in the Specifications, and will be subject to the same conditions as original work performed.

107.05 Federal-Aid Provisions

When the United States Government pays all or any part of the cost of a project, the Federal laws and the rules and regulations made pursuant to such laws must be observed by the Contractor, and The Work shall be subject to the inspection of the appropriate Federal agency. Such inspection shall in no sense make the Federal Government a party to this Contract and will in no way interfere with the rights of either party hereunder.

107.06 Sanitary Provisions

The Contractor shall provide and maintain in a neat, sanitary condition such accommodations for the use of his employees as may be necessary to comply with the requirements of the State Department of Health and other authorities having jurisdiction, and shall permit no public nuisance.

107.07 Public Convenience and Safety

The Contractor shall at all times so conduct The Work as to assure the least possible obstruction of traffic. The safety and convenience of the general public and the residents along the highway and the protection of persons and property shall be provided for by the Contractor as specified under Subsection 104.05, Subsection 107.09, Section 150, the Project Plans, and Special Provisions.

Traffic whose origin and destination is within the limits of the Project shall be provided ingress and egress at all times unless otherwise specified in the Plans or Special Provisions. The ingress and egress includes entrance and exit via driveways at the various properties, and access to the intersecting roads and streets. The Contractor shall maintain sufficient personnel and equipment on the project at all times, particularly during inclement weather, to ensure that ingress and egress are provided when and where needed.

Two-way traffic shall be maintained at all times unless otherwise specified or approved. The Contractor shall not stop traffic without permission granted by the Engineer.

All equipment used on The Work shall come equipped with factory-installed mufflers, or manufacturer's recommended equivalent, in good condition. These mufflers shall be maintained in good condition throughout the construction period.

107.08 Railroad-Highway Provisions

All work to be performed by the Contractor on a railroad company's right-of-way or property shall be done in a manner satisfactory to the chief engineer of the railroad company, or his authorized representative, and shall be performed at such times and in such manner as not to unnecessarily interfere with the movement of trains or traffic upon the track of the railroad company. The Contractor shall use all reasonable care and precaution in order to avoid accidents, damage, or unnecessary delay or interference with the railroad company's trains or other property, or property of tenants of railroad company.

The Contractor shall notify the railroad company and obtain its approval before commencing work on the railroad company's right-of-way or property.

The Contractor shall determine what measures are required by the railroad company to protect its operations and right-of-way or property during construction. Such protection may include the use of a flagger or flaggers provided by the railroad company. The Contractor shall be responsible for ensuring that the required protection is provided and shall pay the railroad

company directly for any and all such services which may be required to accomplish the construction unless otherwise specified.

Any temporary grade crossings or other means needed during construction by the Contractor for transporting materials of any nature and/or equipment across the railroad tracks will be the responsibility of the Contractor to handle directly with the railroad company and bear all costs incidental to such crossings including flagging services provided by the railroad company.

A “Special Provisions for the Protection of Railroad Interests” may be included in the proposal to stipulate insurance and other requirements of the railroad company.

107.09 Barricades and Danger, Warning, and Detour Signs

The Contractor shall furnish, install, and maintain all necessary and required barricades, signs, and other traffic control devices in accordance with these Specifications, Project Plans, Special Provisions, and the MUTCD, and take all necessary precautions for the protection of the work and safety of the public.

Unless otherwise specified, all traffic control devices furnished by the Contractor shall remain the property of the Contractor.

107.10 Forest Protection

In carrying out work within or adjacent to State or National Forests, or any other forests, parks, or other public or private lands, the Contractor shall obtain necessary permits and comply with all of the regulations of the appropriate authorities having jurisdiction over such forest, park, or lands. The Contractor shall keep the areas in an orderly condition, dispose of all refuse, obtain permits for the construction and maintenance of all construction camps, stores, warehouses, residences, latrines, cesspools, septic tanks, and other structures in accordance with the requirements of the appropriate authority.

The Contractor shall take all reasonable precautions to prevent and suppress forest fires and shall require his employees and subcontractors, both independently and at the request of forest officials, to do all reasonably within their power to prevent and suppress and to assist in preventing and suppressing forest fires; to notify a forest official at the earliest possible moment of the location and extent of any fire seen by them; and to extinguish or aid in extinguishing nearby fires.

107.11 Construction Over or Adjacent to Navigable Waters

A. Navigation to Be Protected

Since navigable waterways are under the jurisdiction of the United States Coast Guard and/or the United States Army Corps of Engineers, all work done in, over, on or adjacent to such waters shall comply with their requirements. Free navigation shall not be impeded, and navigable depths shall be maintained.

The Contractor shall comply with permits issued by the United States Coast Guard and/or the United States Army Corps of Engineers, and the Contractor shall obtain and comply with other permits in accordance with the requirements of Subsection 107.02

Special Provisions for environmental protection may be included in the proposal to stipulate environmental commitments and other requirements.

B. Obstructions to be Removed

When the construction has progressed enough to permit removal, all falsework, piling and other obstructions shall be removed to the satisfaction of the Federal agency having jurisdiction. In all cases such clearing must be done thoroughly before The Work will be accepted by the Department.

107.12 Use of Explosives

When the use of explosives is necessary for the prosecution of The Work, the Contractor shall exercise the utmost care not to endanger life or property, and shall obey all State, Federal and other Governmental regulations applying to transportation, storage, use, and control of such explosives. The Contractor shall be completely responsible for any and all damage resulting from the transportation, storage, use, and control of explosives in the prosecution of The Work by the Contractor, the

Section 107-Legal Regulations and Responsibility to the Public

Contractor's agents, or employees; and shall hold the Department harmless from all claims of damages resulting in any manner therefrom.

The Contractor shall notify each public utility owner having structures or other installations, above or below ground, near the site of The Work of his intention to use explosives. Such notice shall be given sufficiently in advance to enable the utility owners to take such steps as they may deem necessary to protect their property from injury. Such notice shall not relieve the Contractor of responsibility for all damages resulting from his blasting operations.

All explosives shall be stored securely in compliance with all laws and ordinances, and all such storage places shall be clearly marked DANGEROUS EXPLOSIVES. Explosives and detonators shall be stored in separate storage facilities in separate areas. Where no laws or ordinances apply, locked storage shall be provided satisfactory to the Engineer, never closer than 1,000 ft (300 m) from any travel-road, building, or camping area.

In all cases where the transport, storage, or use of explosives is undertaken, such activities shall be controlled and directed by fully qualified representatives of the Contractor.

Whenever electric detonators are used, all radio transmitters shall be turned off within a radius of 500 ft (150 m). No blasting supplies shall be transported in vehicles with two-way radio unless the transmitter is turned off, or extra shielding precautions are taken. Appropriate signs shall be placed so as to give ample warning to anyone driving a vehicle equipped with two-way radio. Electrical detonators will not be used within 500 ft (150 m) of a railroad.

Submit a blasting plan to the Engineer a minimum of five working days prior to use of explosives that provides details of the proposed blasting plan, including, but not limited to, the type and amount of explosives, the shot sequence, the description of and distance to the closest inhabitable structure, and other information as requested by the Engineer. Do not begin blasting until the blasting plan has been reviewed and approved in writing by the Engineer. Such approval does not relieve the contractor of the responsibility for the adequate and safe performance of the blasting.

107.13 Protection and Restoration of Property and Landscape

A. General Provisions

The Contractor shall be responsible for the preservation of all public and private property, crops, fish ponds, trees, monuments, highway signs and markers, fences, grassed and sodded areas, etc. along and adjacent to the highway, and shall use every precaution necessary to prevent damage or injury thereto, unless the removal, alteration, or destruction of such property is provided for under the Contract. The Contractor shall use suitable precaution to prevent damage to all underground structures, whether shown on the Plans or not, and shall protect carefully from disturbance or damage, all land monuments and property marks until the Engineer has witnessed or otherwise referenced their location and shall not move them until directed. The Contractor shall not willfully or maliciously injure or destroy trees or shrubs, and he shall not remove or cut them without proper authority.

The Contractor shall be responsible for all sheet piling, shoring, underpinning, etc., as may be required for the protection of abutting property, nearby buildings, streets, and the like.

The Contractor shall be responsible for all damage or injury to property of any character, during the prosecution of The Work, resulting from any act, omission, neglect, or misconduct in his manner or method of executing The Work, or at any time due to defective work or materials, and said responsibility will not be released until the Project shall have been completed and accepted.

When the Contractor's excavating operations encounter remains of prehistoric people's dwelling sites or artifacts of historical or archeological significance, the operations shall be temporarily discontinued. The Engineer will contact archeological authorities and the Office of Environment and Location to determine the disposition thereof. When directed by the Engineer, the Contractor shall excavate the site in such a manner as to preserve the artifacts encountered and shall remove them for delivery to the custody of the proper authorities. Such excavation will be considered and paid for as Extra Work.

When the Contractor's normal operations are delayed by such stoppage or extra work, an appropriate time extension will be granted.

The Contractor shall plan, coordinate, and prosecute the work so that disruption to personal property and business is held to a practical minimum.

No resident or business shall be denied vehicular access to their property for any length of time other than as determined by the Engineer is absolutely necessary. Where two or more existing driveways are present for a business, only one existing driveway shall be closed at any time. All construction areas abutting lawns and yards of residential or commercial property shall be restored promptly. Backfilling of each drainage structure or section of curb and gutter, sidewalk, or driveway shall be accomplished as soon as adequate strength is obtained. Finishing, dressing, and grassing shall be accomplished immediately thereafter as a continuous operation within each area being constructed with emphasis placed on completing each individual yard or business frontage. Care shall be taken to provide positive drainage to avoid ponding or concentration of runoff.

Handwork, including raking and smoothing, shall be required to ensure that roots, sticks, rocks, and other debris are removed in order to provide a neat and pleasing appearance. Grassing, when in season, shall immediately follow in order to establish permanent cover at the earliest date. If grassing is not in season, proper erosion control shall be installed and maintained.

The work described above shall be in addition to that required by Subsection 104.07, "Final Cleaning Up" and Subsection 105.16, "Final Inspection and Acceptance".

B. Erosion and Siltation Control

The Contractor shall take all necessary measures throughout the life of the Project to control erosion and silting of rivers, streams, and impoundments (lakes, reservoirs, etc.). Construction of drainage facilities as well as performance of other Contract work which will contribute to the control of erosion and siltation shall be carried out in conjunction with clearing and grubbing, and earthwork operations as stipulated in Section 161.

C. Pollution

The Contractor shall exercise every reasonable precaution throughout the life of the Contract to prevent pollution of rivers, streams or impoundments. Pollutants such as chemicals, fuels, lubricants, bitumens, raw sewage and other harmful waste shall not be discharged into or alongside rivers, streams, and impoundments, or into natural or manmade channels leading thereto. The Contractor shall also comply with the applicable regulations of other State and Federal departments and to all governmental statues relating to the prevention and abatement of pollution.

D. Insect Control Regulations

The Plant Pest Control Division of the U.S. Department of Agriculture and the Georgia State Department of Agriculture restrict the movement of certain items from areas infested with Japanese Beetles or Imported Fire Ants so as to prevent the spread of these pests to non-infested areas. Where insect infested areas are shown on the Plans, Contractors will control their operations in such a manner as to comply fully with the requirements of Section 155.

E. Reclamation of Material Pits and Waste Disposal Areas

Whenever or wherever the Contractor obtains material from a source or wastes material on an area other than within the Right-of-Way, regardless of the fashion, manner or circumstances for which the source or area is obtained, it shall be reclaimed in accordance with the requirements of Section 160.

F. Mailboxes

The property owner shall have the responsibility for removing and relocating the mailbox to an area outside construction limits.

The Engineer will mark a point for the relocation of the box. The stake should be set so that the location of the box will be convenient to both the mail carrier and the patron, yet not interfering with the proposed work. It may be necessary for the Engineer to confer with the Post Office serving the area.

The Contractor shall notify each affected owner, in writing, that their mailbox is in conflict with the proposed construction, that they have ten days to relocate the box and that, after the expiration of the 10 days notice, if the owner has not relocated the box, it shall be removed by the Contractor and laid upon the owner's property, clear of the Right-of-Way.

Any cost to the Contractor for removing the mailboxes as stated above shall be included in the price bid for other items.

G. Failure to Comply

Failure of the Contractor to comply with any of the above provisions or to install erosion prevention items included in the Contract at the time specified, will be evidence of omission and neglect, and the Contractor will be liable for damages as outlined in Subsection 107.13.H below. Furthermore, the Engineer shall withhold payment on all Contract Items until such time as the Contractor complies in full with all of the aforesaid provisions.

H. Payment for Damages

When or where any direct or indirect damage or injury is done to public or private property by or on account of any act, omission, neglect, or misconduct in the execution of the Work, or in consequence of the nonexecution thereof by the Contractor, the Contractor shall restore, at his own expense, such property to a condition similar or equal to that existing before such damage or injury was done, by repairing, rebuilding or otherwise restoring as may be directed, or shall make good such damage or injury in an acceptable manner.

I. Compensation

All costs pertaining to any requirement contained herein shall be included in the overall Bid submitted unless such requirement is designated as a separate Pay Item in the Proposal.

107.14 Load Restrictions

It is hereby agreed between the Department and the Contractor that in the performance of The Work under the Contract, the following load restrictions and stipulations shall be in full force and effect during the life of the Contract:

A. Parties Affected

The load restrictions and stipulations contained herein shall be applicable to the equipment of the Contractor; each agent or subcontractor employed by the Contractor; and each person or persons, firm, partnership, corporation or any combination thereof, hauling materials, supplies or equipment to or on the Project, by or for the Contractor.

B. Within Project Limits

No hauling equipment which is loaded beyond those limits provided by State Law shall be permitted on any portion of the new or existing pavement structure except that such loads will be permitted on nonstabilized bases and subbases prior to placing roadway paving subject to the provisions of Subsection 107.17.

Axle loads and gross weight limits will be evaluated in accordance with current Georgia Law.

All damage caused by any equipment to any permanent installation or portion of The Work shall be promptly repaired by the Contractor at his expense. When it becomes necessary to cross existing pavement with excessive loads, the Contractor shall provide and remove, at his own expense, proper cushioning by means of earth blanket or otherwise as directed.

C. Outside Project Limits

All equipment users included in Subsection 107.14.A, above, operating equipment on roads outside the Project limits shall be governed by the following regulations:

1. No vehicle shall carry any load in excess of that specified by Georgia Law.
2. On County System roads the maximum total gross weight shall not exceed 56,000 lbs (25,400 kg) unless a vehicle is making a pickup or delivery on such roads.
3. For a specific individual trip the above weight limitations may be exceeded provided a special permit is obtained from the Department for each such movement. A special permit will not relieve the Contractor of liability for damage that may result from such a movement.
4. Authorized personnel of the Office of Permits and Enforcement of the Department shall be permitted to weigh each truck hauling material to the Project whenever the Department so desires. The owner of each truck shall instruct his operators to cooperate with and assist the truck weighers in every way possible.

5. A Certified Public Weigher operating under the provisions of Standard Operating Procedure 15 shall not dispatch any vehicle loaded with material to be incorporated into the Project when the gross vehicle weight exceeds the limit established by law.
6. Ready Mix Concrete trucks shall comply with load restrictions as specified in Laboratory Standard Operating Procedure 10, "Quality Assurance for Ready-Mixed Concrete Plants in Georgia."

D. Responsibilities

It will be the responsibility of the Contractor to advise his personnel, and all equipment users included in Subsection 107.14.A, as to the load restrictions and stipulations contained herein.

E. Excess Loads and Violations

Any load that exceeds the legal limits specified by law may be accepted at the Engineer's discretion for use in The Work; however, weight exceeding the legal limits will be deducted from the total weight and the Contractor will not receive payment for the deducted portion of materials. (For items not measured for payment by weight, the excess weight will be correlated to the appropriate pay quantity and this amount will be deducted from the payment.) The loads of haulers who refuse to have their vehicles weighed will be rejected.

If multiple violations assignable to a given Certified Public Weigher are occurring, that Certified Public Weigher may be suspended from weighing materials dispatched to Department of Transportation projects.

107.15 Responsibility for Damage Claims

The Contractor shall indemnify and save harmless the Department, its officers and employees, from all suits, actions, or claims of any character brought because of any injuries or damage received or sustained by any person, persons, or property on account of the operations of the said Contractor; or on account of or in consequence of any neglect in safe-guarding The Work; or through use of unacceptable materials in constructing The Work; or because of any act of omission, neglect or misconduct of said Contractor; or because of any claims or amounts recovered from any infringements of patent, trademark, or copyright; or from any claims or amounts arising or recovered under the Workmen's Compensation Act, or any other law, ordinance, order, or decree; and so much of the money due the said Contractor under and by virtue of his Contract as may be considered necessary by the Department for such purpose may be withheld for the use of the State; or, in case no money is due, his surety may be held until such suit or suits, action or actions, claim or claims for injuries or damages as aforesaid shall have been settled and suitable evidence to that effect furnished to the Department; except that money due the Contractor will not be withheld when the Contractor produces satisfactory evidence that he is adequately protected by public liability and property damage insurance.

107.16 Opening Sections of Project to Traffic

Whenever any bridge or section of roadway is in acceptable condition for travel, the Engineer may direct that it be opened to traffic, whether or not the opening was originally provided for, and such opening shall not be held to be in any way an acceptance of the bridge or roadway, or any part thereof, or as a waiver of any of the provisions of the Contract. Necessary repairs or renewals made on any section of the roadway or bridge thus opened to traffic under instructions from the Engineer, due to defective material or work, or to any cause other than ordinary wear and tear, pending completion and acceptance of the roadway, bridge, or other work, shall be done by the Contractor, without additional compensation. Also, the Contractor shall not receive additional compensation for completing the Work except as specified in Subsection 104.03.

If the Contractor is dilatory in completing shoulders, drainage structures, or other features of work, the Engineer may so notify him in writing and establish therein a reasonable period of time in which the Work should be completed. If the Contractor is dilatory, or fails to make a reasonable effort toward completion in this period of time, the Engineer may then order all or a portion of the Project opened to traffic. On such sections which are so ordered to be opened, the Contractor shall conduct the remainder of his construction operations so as to cause the least obstruction to traffic and shall not receive any added compensation due to the added cost of the Work by reason of opening such section to traffic.

On any section opened to traffic under any of the above conditions, whether stated in the Special Provisions or opened by necessity of Contractor's operations, or unforeseen necessity, any damage to the highway not attributable to traffic which might occur on such section (except slides) shall be repaired by the Contractor at his expense. The removal of slides shall be done by the Contractor on a basis agreed to prior to the removal of such slides.

107.17 Contractor's Responsibility for the Work

From the first day the Contractor begins work, or from the date Contract Time commences, whichever occurs first, until written final acceptance of the project by the Engineer, the Contractor shall have the charge and care thereof and shall take every precaution against injury or damage to any part thereof by the action of the elements or from any other cause, whether arising from the execution or from the non-execution of The Work. The Contractor shall rebuild, repair, restore, and make good all injuries or damages to any portion of The Work occasioned by any of the above causes before final acceptance and shall bear the expense thereof except that the Department may, in its discretion, reimburse the Contractor for the repair of damage to The Work due to unforeseeable causes beyond the control of and without the fault or negligence of the Contractor, including but not restricted to acts of God, of the public enemy or of governmental authorities. The Contractor's responsibility for damages and injuries is defined in Subsection 104.05.A.

In case of suspension of work from any cause whatsoever, the Contractor shall be responsible for the Project and shall take such precautions as may be necessary to prevent damage to the Project, provide for normal drainage and shall erect any necessary temporary structures, signs, or other facilities at his expense.

107.18 Acquisition of Right-of-Way

Rights of Way for the project will be obtained by the Department, in coordination with local governments and others. However, the Contractor's access to the portions of the right-of-way may be restricted. Where such restrictions are known in advance to the Department they will be listed in the bid proposal. Delays to the progress of the Work may be encountered because of restricted access to portions of the right-of-way. When such delays occur, whether caused by restrictions listed in the bid proposal or restrictions that develop after the Contract is signed, the parties agree in executing the Contract that such delays do not constitute breach of the Contract. Delays in availability of right-of-way beyond those listed in the bid proposal, or that develop after the Contract has been signed, that impact the controlling Item or Items of the Work will not be charged against the Contract Time. Additional compensation for such delays shall not be paid, except as provided in Subsection 105.13, "Claims for Adjustments and Disputes," or Subsection 109.09, "Termination Clause." In the event the Department is unable to acquire right-of-way needed for the project, resulting in delay to or termination of the project, such situation will also be controlled by this Section, and will not constitute a breach of the Contract by the Department.

107.19 Personal Liability of Public Officials

In carrying out any of the provisions of the Contract or in exercising any power or authority granted to the Board, Commissioner, Chief Engineer, their agents and employees, by the Contract, there shall be no liability, either personally or as officials or representatives of the Department, it being understood that in all such matters they act solely as agents and representatives of the Department.

107.20 No Waiver of Legal Rights

Upon completion of The Work, the Department will expeditiously make final inspection and notify the Contractor of acceptance. Such final acceptance, however, shall not preclude or estop the Department from correcting any measurement, estimate, or certificate made before or after completion of The Work, nor shall the Department be precluded or estopped from recovering from the Contractor or his Surety, or both, such over-payment as it may sustain, or by failure on the part of the Contractor to fulfill his obligations under the Contract. A waiver on the part of the Department of any breach of any part of the Contract shall not be held to be a waiver of any other or subsequent breach.

The Contractor, without prejudice to the terms of the Contract, shall be liable to the Department for latent defects, fraud, or such gross mistakes as may amount to fraud, or as regards the Department's rights under any warranty or guaranty.

107.21 Contractor's Responsibility for Utility Property and Services

A. Overhead or Underground Utility Facilities

At points where the Contractor's operations are adjacent to or conflict with overhead or underground utility facilities, or are adjacent to other property, damage to which might result in considerable expense, loss, or inconvenience, work shall not be commenced until all arrangements necessary for the protection thereof have been made.

B. Utility Facility Owners

The names of known utility owners and the location of known utility facilities will be shown on the Plans or in the Special Provisions, and the Contractor shall give 24-hour notice to such utility owners before commencing work adjacent to said utility facilities which may result in damage thereto. Contractor shall further notify utility owners of any changes in his work schedules affecting required action by the utility owners to protect or adjust their facilities. Notice to the utility companies by the Department of the Award of Contract, under Subsection 105.06, shall not be deemed to satisfy the notice required by this paragraph.

C. Cooperation with Facility Owners

The Contractor shall cooperate with the owners of any underground or overhead utility facilities in their removal and rearrangement operations in order that these operations may progress in a reasonable manner, that duplication of rearrangement work may be reduced to a minimum, and that services rendered by those parties will not be unnecessarily interrupted.

D. Interruption of Services

In the event of interruption to water or other utility services as a result of accidental breakage or as a result of being exposed or unsupported, the Contractor shall promptly notify the proper authority and shall cooperate with the said authority in the restoration of service. If utility service is interrupted, repair work shall be continuous until the service is restored. No work shall be undertaken around fire hydrants until provisions for continued service have been approved by the local fire authority.

E. Facilities Supported on Bridges

If the utility facilities are to be supported on bridges, the following provisions shall apply:

1. The Plans will show the location of the facility and the auxiliary items necessary to support the facility.
2. The Contractor who constructs the bridge shall install anchor bolts, thimbles, inserts, or other auxiliary items that are attached to the bridge as a part of the support for the utility facility. The Utility owner, at his or her expense, shall furnish these auxiliary items, unless the Contract indicates that these items are to be furnished by the Contractor as a part of the bridge.
3. The Agency constructing the utility facility shall install hanger rods, pipe rolls, and other attachments necessary for the support of the utility facility as indicated on the Plans. The Utility owner, at his expense, shall furnish these attachments unless otherwise specified. This work shall also include:
 - a. Caulking the openings around the utility where it passes through endwalls to prevent the passage of undesirable materials.
 - b. Painting the exposed portions of utility supports unless such supports are corrosion resistant. Painting shall be done in accordance with the applicable portions of Section 535, unless otherwise specified.
4. The sequence of bridge construction work may be set forth in the Plans and/or the Special Provisions and will show at what stage of the Work a utility owner will be allowed to make the utility installation. Further, all or any portion of The Work under Subsection 107.21.E.3 may be included in the bridge Contract by the Plans and/or the Special Provisions.
5. Any damage to the bridge structure caused by the utility installation shall be repaired to the satisfaction of the Engineer at the expense of the agency installing the utility facility.

F. Clearances

The Plans provide for at least minimum clearance of utilities as required by the National Electrical Safety Code, U.S. Department of Commerce, National Bureau of Standards. Any additional clearance the Contractor may desire or require in performing The Work shall be arranged by the Contractor with the utility owner. The Department will pay no extra compensation for such additional clearances.

G. Delays

Delays and interruptions to the controlling Item or Items of The Work caused by the adjustment or repair of water, gas, or other utility appurtenances and property will be considered for an extension of Contract Time as provided in Subsection 108.07 unless such delays are due to the negligence of the Contractor.

H. Compensation

There will be no direct compensation for complying with the above. Any additional cost to the Contractor for the above services, interruptions, or special procedures, shall be included in the over-all Bid submitted.

107.22 Hazardous and/or Toxic Waste

When the Contractor's operations encounter or expose any abnormal condition which may indicate the presence of a hazardous and/or toxic waste, such operations shall be discontinued in the vicinity of the abnormal condition and the Engineer shall be notified immediately. The presence of barrels, discolored earth, metal, wood, or visible fumes, abnormal odors, excessively hot earth, smoke, or anything else which appears abnormal may be indicators of hazardous and/or toxic wastes and shall be treated with extraordinary caution as they are evidence of abnormal conditions.

The Contractor's operations shall not resume until so directed by the Engineer.

Disposition of the hazardous and/or toxic waste will be made in accordance with the requirements and regulations of the Department of Human Resources and the Department of Natural Resources. Where the Contractor performs work necessary to dispose of hazardous and/or toxic waste, payment will be made at the unit prices for pay items included in the contract which are applicable to such work or, where the contract does not include such pay items, payment will be as provided in Subsection 109.05, "Extra Work."

107.23 Environmental Considerations

A. Construction

Erosion control measures shall be installed, to the greatest practical extent, prior to clearing and grubbing. Particular care shall be exercised along stream buffers, wetlands, open waters and other sensitive areas to ensure that these areas are not adversely affected.

Construction equipment shall not cross streams, rivers, or other waterways except at temporary stream crossing structures shown on the plans or as allowed by permit.

Construction activities within wetland areas are prohibited except for those within the construction limits as shown on the Plans and as specified in Subsection 107.23.E.

All sediment control devices (except sediment basins) installed on a project shall, as a minimum, be cleaned of sediment when one half the capacity, by height, depth or volume, has been reached. Sediment basins shall be cleaned of sediment when one-third the capacity by volume has been reached.

B. Bridge Construction Over Waterways

Construction waste or debris, from bridge construction or demolition, shall be prevented from being allowed to fall or be placed into wetlands, streams, rivers or lakes.

Excavation, dewatering, and cleaning of cofferdams shall be performed in such a manner as to prevent siltation. Pumping from cofferdams to a settling basin or a containment unit will be required if deemed necessary by the Engineer.

Operations required within rivers or streams, i.e. jetting or spudding, shall be performed within silt containment areas, cofferdams, silt fence, sediment barriers or other devices to minimize migration of silt off the project.

C. Borrow and Excess Material Pits

Specific written environmental clearance from the Engineer will be required for any sites not included in the Plans as excess material or borrow areas. No work other than testing shall be started at any potential excess material or borrow site not shown on the plans prior to receiving said environmental clearance from the Engineer.

The Engineer will require a written notice from the Contractor requesting environmental clearance studies and written permission from the property owner at least six weeks prior to intended use of the site. The Department will not begin studies on such sites before a Notice to Proceed is issued.

Section 107-Legal Regulations and Responsibility to the Public

The Engineer will inform the Contractor in writing as to the granting or denial of environmental clearance. If denied, the Contractor may, at no expense to the Department, seek to obtain permits or pursue other remedies that might otherwise render the site(s) acceptable.

Sites included in the Plans have environmental clearance and shall be used only for the purpose(s) specified in the Plans or other contract documents. Should the Contractor wish to expand or utilize said sites for any purpose other than that provided for in the Plans or other contract documents, specific written environmental clearance as noted above shall be obtained.

D. Control of Pollutants

Pollutants or potentially hazardous materials, such as fuels, lubricants, lead paint, chemicals or batteries, shall be transported, stored, and used in a manner to prevent leakage or spillage into the environment. The Contractor shall also be responsible for proper and legal disposal of all such materials.

Equipment, especially concrete or asphalt trucks, shall not be washed or cleaned-out on the Project except in areas where unused product contaminants can be prevented from entering waterways.

E. Temporary Work in Wetlands Outside of the Construction Limits within the Right-of-Way and Easement Areas

Temporary work in wetlands (that are not delineated with orange barrier fence) will be subject to the following requirements:

1. Temporary work in wetlands shall be accomplished by using temporary structures, timber, concrete, soil with geotextile fabric, or other suitable matting. The area shall not be grubbed.
2. Soil matting shall be protected from erosion in accordance with the Specifications.
3. Whenever temporary work is required in Saltwater Marsh Wetlands, all temporary structures and/or matting shall be removed in their entirety prior to Final Acceptance of the Project. Matted and compressed soils shall be backfilled to their original ground elevation with material meeting the requirements of Section 212 – Granular Embankment.
4. Whenever temporary work is required in Freshwater Wetlands, all temporary structures and/or matting (exclusive of soil matting to be retained in the final roadway section) shall be removed in their entirety prior to Final Acceptance of the Project.

Once the temporary materials have been removed, the area shall be covered by Excelsior or Straw blankets according to Section 713 of the Specifications. The grassing and ground preparation referenced in Subsection 713.3.03, "Preparation", will not be applicable to this Work.

5. The Engineer shall be notified so that a field inspection may be conducted to certify that the temporary materials were properly removed and that the area was properly restored. The Contractor shall be responsible for any corrective action required to complete this Work.
6. There will be no separate measurement or payment for this Work. The cost associated with this work shall be included in the overall Bid submitted.

F. Environmentally Sensitive Areas

Some archaeological sites, historic sites, wetlands, streams, stream and pond buffers, open waters and protected animal and plant species habitat within the existing/required Right-of-Way and easement areas may be designated as ENVIRONMENTALLY SENSITIVE AREAs (ESAs). These areas are shown on the applicable Plan sheets and labeled "ESA" (e.g. ESA – Historical Boundary, ESA – Wetland Boundary). The Department may require that some ESAs or portions thereof be delineated with orange barrier fence. The Contractor shall install, maintain, and replace as necessary orange barrier fence at ESAs as delineated in the Plan sheets.

The Contractor shall not enter, disturb, or perform any construction related activities, other than those shown on the approved plan sheets within areas designated as ESAs including ESAs or portions thereof not delineated with orange barrier fence. This includes but is not limited to the following construction activities: clearing and grubbing; borrowing; wasting; grading; filling; staging/stockpiling; vehicular use and parking; sediment basin placement; trailer placement; and equipment cleaning and storage. Also, all archaeological sites, historic sites, wetlands, streams, stream and pond buffers, open waters, and protected animal and plant species habitat that extend beyond the limits of existing/required Right-of-Way and easement areas shall be considered ESAs and the Contractor shall not perform any construction related activities (such as those listed above) within these areas or make agreements with property owners to occupy these areas for construction related activities (such as those listed above). The Contractor shall make all construction employees aware of the location(s) of each ESA and the requirement to not enter or otherwise disturb these areas.

If the Contractor is found to have entered an ESA, either within or outside the project area, for any purpose not specifically shown on the approved plan sheets, the Department may, at its discretion, issue a stop work order for all activities on the project except erosion control and traffic control until such time as all equipment and other items are removed and the ESA is restored to its original condition.

However, should damage to an ESA occur as a result of the Contractor's action in violation of this section, and notwithstanding any subsequent correction by the Contractor, the Contractor shall be liable for any cost arising from such action, including but not limited to, the cost of repair, remediation of any fines, or mitigation fees assessed against the Department by another government entity.

107.24 Closing of Roadways Without On-Site Detours

When existing roadways are to be closed to through traffic and on-site detours are not provided, the Contractor shall submit a written notice to the Engineer for approval 14 days prior to the closure of the existing roadways.

After receiving approval from the Engineer for the closure, the Contractor shall install signs at each closure site, in accordance with the MUTCD, to inform the traveling public of the proposed closure, including the date of closure. The sign shall be placed 5 days prior to the closure, at the direction of the Engineer.

Prior to the closure, the Area Engineer will inform local government officials and agencies, local news media, and the DOT Public Information Office of the proposed closure of the roadways.

107.25 Disruption to Residential and Commercial Property

The Contractor shall plan, coordinate, and prosecute the work such that disruption to personal property and business is held to a practical minimum.

All construction areas abutting lawns and yards of residential or commercial property shall be restored promptly. Backfilling of each drainage structure or section of curb and gutter, sidewalk, or driveway shall be accomplished as soon as adequate strength is obtained. Finishing, dressing and grassing shall be accomplished immediately thereafter as a continuous operation within each area being constructed with emphasis placed on completing each individual yard or business frontage. Care shall be taken to provide positive drainage to avoid ponding or concentration of runoff.

Handwork, including raking and smoothing, shall be required to ensure that roots, sticks, rocks, and other debris is removed in order to provide a neat and pleasing appearance. Grassing, when in season, shall immediately follow in order to establish permanent cover at the earliest date. If grassing is not in season, proper erosion control shall be installed and maintained.

The work described herein shall be in addition to that required by Subsection 104.07 "Final Cleaning Up" and Subsection 105.16 "Final Inspection and Acceptance."

Section 108—Prosecution and Progress

108.01 Subletting of Contract

The Contractor shall not sublet, sell, transfer, assign, or otherwise dispose of the Contract or Contracts, or any portion thereof, or of his/her right, title, or interest therein, without written consent of the Engineer. For Subcontracts, consent of the Engineer will not be considered until after award of the Contract.

In case such consent is given, the Contractor will be permitted to sublet a portion thereof, but shall perform, with his/her own organization, work amounting to not less than thirty percent (30%) of the total Contract cost, including materials, equipment, and labor.

As further exception, any items designated as Specialty Items may be performed by Subcontract and the cost of any such Specialty Items so performed by Subcontract may be deducted from the total cost before computing the amount of work required to be performed by the Contractor with his/her own organization.

Purchase of materials by the Prime Contractor for use by a Subcontractor will not be allowed when computing the 30% requirement.

No Subcontracts, or transfer of Contract, shall in any case release the Prime Contractor of his/her liability under the Contract and Bonds. No Subcontractor shall commence work in advance of the written approval of the Subcontract by the Department. Except for certain items exempted by the State Transportation Board, each Subcontractor shall be prequalified or registered with the Department. Each Subcontract for a Registered Subcontractor shall not exceed \$1,000,000.00 and Subcontracts for Prequalified Contractors shall not exceed their current capacity. Prequalified or Registered Subcontractors shall be qualified or registered with the Department in accordance with Chapter 672-5 of the Rules and Regulations Governing the Prequalification of Prospective Bidders adopted by the State Transportation Board.

In the event any portion of a Subcontract is further sublet, all of the provisions governing subletting, including registration and written approval by the Engineer, shall apply.

This Sub-Section shall not apply to Contracts between the Department and counties, municipalities, or other State agencies.

All subcontract agreements between the Prime Contractor and subcontractor shall be in writing and shall contain all of the Federal-Aid requirements and pertinent provisions of the Prime Contract. The Prime Contractor shall, upon request by the Engineer, furnish copies of any subcontract agreement to the Department within ten (10) days of such request. This provision applies to all subcontracts, including second or multi-tier subcontracts.

According to the provisions stated above, the following items are designated Specialty Items for general transportation system construction and building construction whenever they appear in the Contract:

General Transportation System Contracts

- Grassing items
- Fencing items
- Highway lighting items
- Sign items
- Guardrail items (except bridge handrail)
- Utility items
- Comfort and convenience items in rest areas
- Landscaping items
- Pressure grouting, slab removal and replacement
- Permanent traffic markings
- Signal systems
- Railroad track work above sub-ballast
- Drilled caisson foundations

- Construction layout
- Asphaltic concrete leveling and asphalt concrete patching (when used on surface treatment and slurry seal resurfacing contracts)

Building Contracts

- Structural Steel
- Plumbing
- Heating, ventilation, and air conditioning (HVAC)
- Electrical

- Elevators
- Construction layout

The Contractor's cost for Construction Layout shall be fully documented prior to deduction from the original Contract amount)

108.02 Notice to Proceed

The delivery to the Contractor of a notice, stating that construction is authorized, constitutes Notice to Proceed. The Contractor shall do no work under the Contract until receipt of the Notice to Proceed, and the Department will not be obligated to pay for work done prior to receipt of the Notice to Proceed.

Within 10 calendar days after the Notice to Proceed has been issued, the Contractor shall begin The Work. Contract Time charges for Available Day and Calendar Day projects will begin on the date the Contractor starts to work, or 10 days after the Notice to Proceed, whichever occurs first. For Completion Date projects Contract Time charges shall begin on the day after the Notice to Proceed.

Where the Contractor's access to part of the right-of-way is restricted, either the Special Provisions in the Contract or the Conditional Notice to Proceed will indicate such restrictions. The Department may, at its option, issue a Conditional Notice to Proceed if, in the opinion of the Engineer, a sufficient portion of the right-of-way is available to the Contractor to allow construction to proceed.

108.03 Prosecution and Progress

The Contractor shall provide sufficient materials, equipment, and labor to guarantee the completion of the Project in accordance with the Plans and Specifications within the time set forth in the Proposal. Unless otherwise required by the Engineer, each operation shall begin as soon after the Contract is awarded as conditions will permit. Each class of work will be expected to continue from the date it is begun until it is completed.

The Contractor shall furnish the Engineer, for approval, a Progress Schedule immediately following the receipt of the Notice to Proceed. Unless otherwise specified, the schedule shall be prepared on forms furnished by the Department or an acceptable critical path schedule will be used as the basis for establishing the controlling items of work and as a check on the progress of The Work. This Schedule will not be required on resurfacing projects.

Approval of the Progress Schedule shall not be construed to imply approval of any particular method or sequence of construction or to relieve the Contractor of providing sufficient materials, equipment, and labor to guarantee the completion of the Project in accordance with the Plans, Specifications, and Special Provisions within the time set forth in the Proposal. Contract Time as shown in the Proposal is the allowable time. The Contractor's proposed Progress Schedule may indicate a completion date in advance of the Contract Specified Completion Date; however, the Department will not be liable in any way for the Contractor's failure to complete the project prior to the Contract Specified Completion Date.

At least 48 hours before commencing The Work, the Contractor shall notify the Engineer of his intention to begin so that proper inspection may be provided. Should the prosecution of The Work be discontinued for any reason, the Contractor shall notify the Engineer at least 24 hours in advance of resuming operations.

If the Contractor's operations are materially affected by changes in the Plans or in the amount of work, or if he has failed to comply with the approved schedule, the Contractor shall submit a revised Progress Schedule, if requested by the Engineer, which schedule shall show how he proposes to prosecute the balance of The Work. The Contractor shall submit the revised Progress Schedule within 10 days after the date of the request. The Contractor shall incorporate into every Progress Schedule submitted, any contract requirements regarding the order of performance of portions of The Work.

No payments will be made to the Contractor while he is delinquent in the submission of a Progress Schedule or a revised Progress Schedule.

108.04 Limitation of Operations

The Contractor shall conduct The Work at all times in such a manner and in such sequence as will assure the least interference with traffic and shall provide for smooth and safe traffic flow. It shall be the decision of the Engineer as to what will assure the least interference with traffic and smooth, safe traffic flow. Also, the Engineer may require the Contractor to finish a section on which work is in progress before work is started on any additional sections if the opening of such section is essential to public convenience.

108.05 Character of Workers, Methods and Equipment

The Contractor shall at all times employ sufficient labor and equipment for prosecuting the several classes of work to full completion in the manner and time required by these Specifications.

All workers shall have sufficient skill and experience to perform properly the work assigned to them. Workers engaged in special or skilled work shall have sufficient experience in such work and in the operation of the equipment required to perform all work properly and satisfactorily.

Any person employed by the Contractor or by any Subcontractor who the Engineer determines does not perform work in a proper and skilled manner or is intemperate or disorderly shall, at the written request of the Engineer, be removed forthwith by the Contractor or Subcontractor employing such person, and shall not be employed again in any portion of The Work without the approval of the Engineer.

Should the Contractor fail to remove such person or persons as required above, or fail to furnish suitable and sufficient personnel for the proper prosecution of The Work, the Engineer may suspend The Work by written notice until such orders are complied with.

All equipment that is proposed to be used on The Work shall be of sufficient size and in such mechanical condition as to meet the requirements of The Work and to produce a satisfactory quality of work. Equipment used on any portion of the Project shall be such that no injury to the roadway, adjacent property, or other highways will result from its use.

When the methods and equipment to be used by the Contractor in accomplishing the construction are not prescribed in the Contract, the Contractor is free to use any methods or equipment that he demonstrates to the satisfaction of the Engineer will accomplish The Work in conformity with the requirements of the Contract.

When the Contract specifies that the construction be performed by the use of certain methods and equipment, such methods and equipment shall be used unless others are authorized by the Engineer. If the Contractor desires to use a method or type of equipment other than those specified in the Contract, he may request authority from the Engineer to do so. The request shall be in writing and shall include a full description of the methods and equipment proposed to be used and an explanation of the reasons for desiring to make the change. If approval is given, it will be on the condition that the Contractor will be fully responsible for producing construction work in conformity with Contract requirements. If, after trial use of the substituted methods or equipment, the Engineer determines that the work produced does not meet Contract requirements, the Contractor shall discontinue the use of the substitute method or equipment and shall complete the remaining construction with the specified methods and equipment. The Contractor shall remove the deficient work and replace it with work of specified quality, or take such other corrective action as the Engineer may direct. No change will be made in basis of payment for the construction items involved nor in Contract Time as a result of authorizing a change in methods or equipment under these provisions.

108.06 Temporary Suspension of Work

The Engineer has the authority to suspend The Work wholly or in part, for as long as he may deem necessary, because of unsuitable weather, or other conditions considered unfavorable for continuing The Work, or for as long as he may deem necessary by reason of failure of the Contractor to carry out orders given, or to comply with any provisions of the Contract. No additional compensation will be paid the Contractor because of suspension. If it becomes necessary to stop The Work for an indefinite period, the Contractor shall store all materials in such a way that they will not impede the traveling public unnecessarily or become damaged in any way, and he shall take every precaution to prevent damage or deterioration of The Work done; provide suitable drainage of the roadway, and erect temporary structures where necessary. The Work shall be resumed when conditions are favorable or when corrective measures satisfactory to the Engineer have been applied; when, and as ordered by the Engineer in writing. The Contractor shall not stop The Work without authority.

If The Work is stopped by any temporary or permanent injunction, court restraining order, process or judgment of any kind, directed to either of the parties hereto, then such period or delay will not be charged against the Contract Time nor shall the Department be liable to the Contractor on account of such delay or termination of work

108.07 Determination of Contract Time

The definition of Contract Time and when Contract Time officially begins is stated in Subsection 101.19. After the Contract has been signed by all parties, Contract Time becomes the specified period of time, agreed upon by the Contractor, the Surety, and the Department, during which all Items and quantities of work set forth in the Proposal and included in the original Contract will be completed.

A. Available Day Contracts

An available day is defined in Subsection 101.04. The Engineer will furnish the Contractor a written monthly statement showing the total number of available days charged through the preceding month. The Contractor will be allowed one week in which to file a written protest setting forth in what respect said statement is incorrect, otherwise the statement shall be deemed to have been accepted by the Contractor as correct.

B. Calendar Day Contracts

When the Contract Time is on a calendar day basis it shall consist of the number of calendar days stated in the Contract counting from the date Contract Time starts as defined in Subsection 108.02, including all Sundays, holidays, and non-work days.

C. Completion Day Contracts

When the Contract completion time is a fixed date, it shall be the date on which all work on the Project shall be completed.

D. Settlement Periods

Settlement Periods shall be computed in calendar days unless otherwise stated in the contract documents.

E. Extension of Contract Time

If satisfactory fulfillment of the Contract requires performance of work in greater quantities than those set forth in the Proposal, the Contract Time allowed for performance shall be extended on a basis commensurate with the amount and difficulty of the added work as determined by the Engineer, whose decision shall be final and conclusive.

If the estimated time for the consolidation of embankments at bridge ends is extended, the Contract Time will be extended as provided in Subsection 208.3.05.B.3.

If the normal progress of The Work is delayed for reasons beyond his control, the Contractor shall, within 15 days after the start of such delay, file a written request to the Engineer for an extension of time setting forth therein the reasons and providing complete documentation for the delay which he believes will justify the granting of his request. The Contractor's plea that insufficient time was specified is not a valid reason for extension of time. If the Engineer finds that The Work was delayed because of conditions beyond the control and without the fault of the Contractor, he may extend the time for completion in such amount as the conditions justify.

Any authorized extension of the Contract Time will be in full force and effect the same as though it was the original Contract Time.

F. Suspension of Time Charges

If the Engineer suspends The Work by reason of failure of the Contractor to carry out written orders given, or to comply with any provision of the Contract, Time Charges will continue through the period of such suspension.

If the Contractor is declared in default, Time Charges will continue.

Except on Completion Date Contracts, Time Charges will not be made against the Contract when the only remaining controlling items of work are shut down by the Engineer because of seasonal limitations or temperature controls.

G. When Time Charges Cease

Time charges will cease when all work on Contract Items have been completed to the satisfaction of the Engineer. The only exception to this requirement is that a satisfactory growth of vegetative cover and application(s) of nitrogen will not be required when Time Charges are stopped, provided all filling of washes and repairs to planted areas have been accomplished. Maintenance of planted areas in order to produce a satisfactory growth after Time Charges have stopped will be performed without assessment of liquidated damages provided this work is diligently prosecuted. If, during this waiting period, maintenance of any part of the Project is inadequate, the Engineer may resume Time Charges 10 days after written notification to the Contractor and will continue Time Charges until the unsatisfactory conditions are corrected.

108.08 Failure or Delay in Completing Work on Time

Time is an essential element of the Contract, and any delay in the prosecution of The Work may inconvenience the public, obstruct traffic, or interfere with business. In addition to the aforementioned inconveniences, any delay in completion of The Work will always increase the cost of engineering. For this reason, it is important that The Work be pressed vigorously to completion. Should the Contractor or, in case of default, the Surety fail to complete The Work within the time stipulated in the Contract or within such extra time that may be allowed, charges shall be assessed against any money due or that may become due the Contractor in accordance with the following schedule:

Schedule of Deductions for Each Day of Overrun in Contract Time			
Original Contract Amount		Daily Charges	
From More Than	To and Including	Available Day	Calendar Day or Completion Date
\$0	\$500,000	\$118	\$84
\$500,000	\$1,000,000	\$211	\$151
\$1,000,000	\$2,000,000	\$346	\$247
\$2,000,000	\$5,000,000	\$547	\$391
\$5,000,000	\$10,000,000	\$998	\$713
\$10,000,000	\$20,000,000	\$1667	\$1191
\$20,000,000	\$40,000,000	\$2617	\$1869
\$40,000,000	—	\$7125	\$5089

When the Contract Time is on either the calendar day or completion date basis, the schedule for calendar days shall be used. When the Contract Time is based on an available day basis, the schedule for available days shall be used.

For each Calendar Day or Available Day, as specified, that any work shall remain uncompleted after the contract time specified for the completion of The Work required by the Contract, the sum specified in the Contract will be deducted from any money due the Contractor, not as a penalty, but as liquidated damages; provided however, that due account shall be taken of any adjustment of the contract time for completion of the work granted under the provisions of Subsection 108.07.E.

The Department may waive such portions of the liquidated damages as may accrue after the work is in condition for safe and convenient use by the traveling public.

A. Liquidated Damages

The amount of such charges is hereby agreed upon as fixed liquidated damages due the Department after the expiration of the time for completion specified in the Contract. The Contractor and his Surety shall be liable for liquidated damages in excess of the amount due the Contractor on the final payment.

These fixed liquidated damages are not established as a penalty but are calculated and agreed upon in advance by the Department and the Contractor due the uncertainty and impossibility of making a determination as to the actual and consequential damages which are incurred by the Department, the State, and the general public as a result of the failure on the part of the Contractor to complete The Work on time.

3. **Deduction From Partial Payments:** Liquidated damages, as they accrue, will be deducted from periodic partial payments.
4. **Deduction From Final Payment:** The full amount of liquidated damages will be deducted from final payment to the Contractor and/or his Surety.
5. **No Liquidated Damages Charged for Delay by the Department:** In case of default of the Contract and the subsequent completion of The Work by the Department as hereinafter provided, the Contractor and his Surety shall be liable for the liquidated damages under the Contract, but no liquidated damages shall be chargeable for any delay in the final completion of The Work by the Department due to any unreasonable action, negligence, omission, or delay of the Department. In any suit for the collection of or involving the assessment of liquidated damages, the reasonableness of the amount shall be presumed. The liquidated damages referred to herein are intended to be and are cumulative and shall be in addition to every other remedy now or hereafter enforceable at law, in equity, by statute, or under the Contract.

B. No Waiver of Department's Rights

Permitting the Contractor to continue and finish The Work or any part of it after the expiration of the time allowed for completion or after any extension of time, shall not operate as a waiver of the rights of the Department under the Contract.

108.09 Default of Contract

If the Contractor fails to begin The Work within the time specified, or fails to perform The Work with sufficient workers, equipment, or materials to ensure its prompt completion, or performs The Work unsuitably, or neglects or refuses to remove materials or perform anew such work as shall be rejected as defective and unsuitable, or discontinues the prosecution of The Work, or from any other cause whatsoever does not carry on The Work in an acceptable manner, or becomes insolvent or is adjudicated a bankrupt, or commits any act of bankruptcy or insolvency, or allows any final judgement to stand against him unsatisfied for a period of 10 days, or makes an assignment for the benefit of creditors, or fails to comply with the contract requirements regarding wage payments or EEO requirements, or fails to sign the standard release form as stipulated in Subsection 109.08 "Final Payment," the Engineer may give notice in writing by registered or certified mail to the Contractor and the Surety, stating the nature of the deficiencies and directing that The Work including its progress be remedied and made satisfactory.

If, within 10 days after such notice, the Contractor or his Surety does not proceed in satisfactory way to remedy the faults specified in said notice, the Engineer will notify the Contractor and his Surety by registered or certified mail that the Contractor is in default and, by the same message, direct the Surety to take over The Work including all of the obligations pertaining to the Contract. If the Surety takes over the work in a satisfactory way within 10 days after such notice of default, the Department will thenceforth pay to the Surety the amounts due and to become due under the Contract, less all deductions provided herein including liquidated damages. The Department shall not be liable for any sums not due under the Contract and shall not be made a party to any dispute between the Contractor and the Surety.

If the Contractor is declared in default and The Work and other Contract obligations are taken over by the Surety as required by its Bond, and when all parts of The Work have been completed and found to be satisfactory by the Engineer, as provided for in Subsection 105.16 "Final Inspection and Acceptance," the said Surety is hereby constituted the attorney in fact of the Contractor for the purpose of executing such final releases as may be required by the Department or to do any other act or thing, including the execution of any documents, necessary to the completion of the Contract and a final settlement of same, including but not limited to those documents required by the provisions regarding final payment and release as set forth in Subsection 109.08.

For all purposes, as herein set out and defined, including the execution of documents necessary to the final completion and settlement of the Contract, the Surety, under such circumstances, is hereby authorized and directed by the Contractor to perform such acts and execute such documents as fully and completely as though the same were performed or executed by such contractor, and to be lawfully binding upon such Contractor as though such acts had been performed or such documents executed by him in person.

If the Surety does not take over The Work in a satisfactory way within 10 days after the notice of default, or does not proceed to finish The Work according to the Contract, the Department shall have full power and authority, without impairing the obligation of the Contract or the Contract Bond, to take over the completion of The Work; to appropriate or use any or all material and equipment on the ground that may be suitable, to enter into agreements with others for the completion of the Contract according to the terms and provisions thereof; or to use such other methods as may be required for the completion of the Contract. In so assuming the obligations of the Contractor, the Department does so as the agent of the Contractor. Assumption of these duties and obligations by the Department will not act as a release of the Contractor or his Surety from any of the provisions of this Contract. The Contractor and his Surety shall be liable for all costs incurred by the Department in completing The Work and also for all liquidated damages in conformity with the terms of the Contract. If the sum of such liquidated damages and the expense so incurred by the Department is less than the sum which would have been payable under this Contract if it had been completed by the Contractor or his Surety, the Contractor, or his Surety, shall be entitled to receive the difference; and if the sum of such expense and such liquidated damages exceeds the sum that would have been payable under the Contract, the Contractor and his Surety shall be liable and shall pay to the Department the amount of such excess. Notice to the Contractor shall be deemed to have been served when delivered to the person in charge of any office used by the Contractor, his representative at or near The Work or by registered or certified mail addressed to the Contractor at the last known place of business.

Time Charges shall continue through a period of a default in compliance with the provisions of Subsection 108.07.F.

108.10 Termination of Contractor's Responsibility

Except as specified in the Contract Bond and in Subsection 107.20, the Contractor's responsibility for The Work shall terminate upon final acceptance of The Work by the Department.

Section 109—Measurement and Payment

109.01 Measurement and Quantities

The method of measurement and computations to be used in determination of quantities of material furnished and of work performed under the Contract will be those methods generally recognized as conforming to good engineering practice.

Unless otherwise specified, longitudinal measurements for area computations will be made along the surface, and no deductions will be made for individual fixtures having an area of 9 ft² (1 m²) or less. Unless otherwise specified, transverse measurements for area computations will be the neat dimensions shown on the Plans or ordered in writing by the Engineer.

Where payment is to be made by the square yard (square meter) for a specified thickness, the length will be measured on the surface along the centerline and the pay width shall be that width specified on the plans for the Final surface of the completed section. Intermediate courses shall be placed at a width sufficient to support successive courses with no detriment to the stability of the successive courses. The width of material required beyond the pay width will not be eligible for payment and shall be considered incidental to the work.

Structures will be measured according to neat lines shown on the Plans or as altered to fit field conditions.

All items which are measured by the linear foot (linear meter), such as pipe culverts, guard rail, underdrains, etc., will be measured parallel to the base or foundation upon which such structures are placed, unless otherwise shown on the Plans.

In computing volumes of excavation, the average end area method or other acceptable methods will be used.

The term "gage," when used in connection with the measurement of steel plates, will mean the U.S. Standard Gage.

When the term "gage" refers to the measurement of electrical wire it will mean the wire gage specified in the National Electrical Code.

The term "ton" will mean the short ton consisting of 2,000 pounds avoirdupois. The term "megagram" will mean one metric ton, equivalent to 1,000 kg. Any commodity paid for by weight shall be weighed on scales that have been approved as specified below and which are furnished at the expense of the Contractor or Supplier. Weighing and measuring systems including remote controls shall be subject to type-approval by the Department of Transportation. The manufacture, installation, performance, and operation of such devices located in Georgia shall conform to, and be governed by, the Official Code of Georgia, Annotated, Section 10-2-5 of the Georgia Weights and Measures Act, the Georgia Weights and Measures Regulations, as amended and adopted, the current edition of the National Bureau of Standards Handbook 44, and these Specifications. Weighing and measuring systems located outside Georgia which are utilized for weighing materials to be used in Department work shall be manufactured, installed, approved, and operated in accordance with applicable laws and regulations for the state in which the scales are located.

All weighing, measuring, and metering devices used to measure quantities for payment shall be suitable for the purpose intended and will be considered to be "commercial devices." Commodity scales located in Georgia shall be certified before use for accuracy, condition, etc., by the Weights and Measures Division of the Georgia Department of Agriculture, or its authorized representative. Scales located outside Georgia shall be certified in accordance with applicable laws and regulations for the state in which the scales are located. This certification shall have been made within a period of not more than one year prior to date of use for weighing commodity.

All equipment and all mechanisms and devices attached thereto or used in connection therewith shall be constructed, assembled, and installed for use so that they do not facilitate the perpetration of fraud. Any scale component or mechanism, which if manipulated would alter true scale values (including manual zero setting mechanisms) shall not be accessible to the scale operator. Such components and mechanisms that would otherwise be accessible to the scale operator shall be enclosed.

Provisions shall be made for security seals where appropriate on equipment and accessories. A security seal shall be affixed to any adjustment mechanism designed to be sealed. Scale or accessory devices shall not be used if security seals have been broken or removed.

Any certified scale or scale component which has been repaired, dismantled, or moved to another location shall again be tested and certified before it is eligible for weighing.

Whenever materials that are paid for based on weight are from a source within the State, the scales shall be operated by and the weights attested to by signature and seal of a duly authorized Certified Public Weigher in accordance with Standard Operating Procedure 15 and the Official Code of Georgia, Annotated, Section 10-2-5 of the Georgia Weights and Measures Act as amended and adopted. When such materials originate from another state that has a certified or licensed weigher program, the scales shall be operated by a weigher who is certified by that state in accordance with applicable laws, and weight ticket recordation shall be in accordance with Standard Operating Procedure 15.

When materials are paid for based on weight and originate from another state which has no program for certifying or licensing weighers, the materials shall be weighed on scales located in the State of Georgia by a Certified Public Weigher in accordance with Standard Operating Procedure 15 and the Official Code of Georgia, Annotated, Section 10-2-5 of the Georgia Weights and Measures Act as amended and adopted.

No scale shall be used to measure weights greater than the scale manufacturer's rated capacity. A digital recorder shall be installed as part of any commodity scale. The recorder shall produce a printed digital record on a ticket with the gross, tare, and net weights of the delivery trucks, along with the date and time printed for each ticket. Provisions shall be made so that the scales or recorders may not be manually manipulated during the printing process. The system shall be so interlocked as to allow printing only when the scale has come to rest. Either the gross or net weight shall be a direct scale reading. Printing and recording systems that are capable of accepting keyboard entries shall clearly and automatically differentiate a direct scale weight value from any other weight values printed on the load ticket.

All scales used to determine pay quantities shall be provided to attain a zero balance indication with no load on the load receiving element by the use of semi-automatic zero (push-button zero) or automatic zero maintenance.

Vehicle scales shall have a platform of sufficient size to accommodate the entire length of any vehicle weighed and shall have sufficient capacity to weigh the largest load. Adequate drainage shall be provided to prevent saturation of the ground under the scale foundation.

The Engineer, at his discretion, may require the platform scales to be checked for accuracy. For this purpose the Contractor shall load a truck with material of his choosing, weigh the loaded truck on his scales, and then weigh it on another set of certified vehicle scales. When the difference exceeds 0.4 percent of load, the scales shall be corrected and certified by a registered scale serviceman registered in the appropriate class as outlined in the Georgia Weights and Measures Regulations or in accordance with applicable requirements of the state in which the scales are located. A test report shall be submitted to the appropriate representative of the Department of Agriculture.

Materials to be measured by volume in the hauling vehicle shall be hauled in approved vehicles and measured therein at the point of delivery. Vehicles for this purpose may be of any size or type acceptable to the Engineer, provided that the body is of such shape that the actual contents may be readily and accurately determined. All vehicles shall be loaded to their water level capacity as determined by the Engineer, provided that the body is of such shape that the actual contents may be readily and accurately determined.

Cement and lime will be measured by the ton (megagram). Whenever cement or lime is delivered to the Project in tank trucks, a certified weight shall be made at the shipping point by an authorized Certified Public Weigher who is not an employee of the Department. Whenever cement and lime are from a source within the State, the scales shall be operated by the weights attested to by signature and seal of a duly authorized Certified Public Weigher in accordance with Standard Operating Procedure 15 and the Official Code of Georgia, Annotated, Section 10-2-5 of the Georgia Weights and Measures Act as amended and adopted. When such materials originate from another state that has a certified or licensed weigher program, the scales shall be operated by a weigher who is certified by that state in accordance with applicable laws, and the weight ticket recordation shall be in accordance with Standard Operating Procedure 15. When cement and lime originate from another state that has no program for certifying or licensing weighers, the materials shall be weighed on scales located in the State of Georgia by a Certified Public Weigher in accordance with Standard Operating Procedure 15 and the Official Code of Georgia, Annotated, Section 10-2-5 of the Georgia Weights and Measures Act as amended and adopted.

The shipping invoice shall contain the certified weights and the signature and seal of the Certified Public Weigher. A security seal shall also be affixed to the discharge pipe cap on the tank truck before leaving the shipping point. The number on the security seal shall also be recorded on the shipping invoice. The shipping invoice for quicklime shall also contain a certified lime purity percentage. Unsealed tank trucks will require reweighing by a Certified Public Weigher.

Timber will be measured by the thousand feet board measure (MFBM) (cubic meter) actually incorporated in the structure. Measurements will be based on nominal widths and thickness and the actual length in place. No additional measurement will be made for splices except as noted for overlaps as shown on the Plans.

The term "Lump Sum" when used as an item of payment will mean complete payment for The Work described in the Contract.

When a complete structure or structural unit (in effect, "Lump Sum" work) is specified as the unit of the measurement, the unit will be construed to include all necessary fittings and accessories.

Rental of equipment will be measured as defined in Subsection 109.05.B.4.

When standard manufactured items are specified as fence, wire, plates, rolled shapes, pipe conduits, etc., and these items are identified by gage, unit weight, section dimensions, etc., such identification will be considered to be nominal weights or dimensions. Unless more stringently controlled by tolerance in cited Specifications, manufacturing tolerances established by the industries involved will be accepted.

109.02 Measurement of Bituminous Materials

A. By Weighing the Material

The Department prefers this method whenever it is practicable. This method will be considered acceptable under the following conditions:

1. **Weighed On Project:** If the weights of the bituminous materials delivered by tank trucks are to be determined on the Project, weights shall be determined on scales that have been previously checked by the Department with standard weights for accuracy. The scale platform shall be large enough to accommodate the entire vehicle at one time. Under no conditions will truck scales be used to measure weights greater than their rated capacity. All weights not determined in the presence of an authorized representative of the Department shall be made by a Certified Public Weigher who is not an employee of the Department of Transportation and who is in good standing with the Georgia Department of Agriculture. The weight tickets shall carry both the signature and seal of the Certified Public Weigher.
2. **Weighed At Shipping Point:** A certified weight made at the shipping point by an authorized Certified Public Weigher who is not an employee of the Department of Transportation and who is registered with the Georgia Department of Agriculture, will be acceptable provided all openings in the tank have been sealed by the producer and when, upon inspection on the Project, there is no evidence of any leakage. The shipping ticket in this case must carry the signature and seal of the Certified Public Weigher. If the tank is not completely emptied the amount of material remaining in the tank truck will be measured by either weight or volume and the amount so determined, as verified by the Engineer, will be deducted from the certified weight.
3. **By Extraction Analysis:** The weight of bituminous material used will be determined by extraction tests made by the field laboratory. The average asphalt content for each Lot will be used to compute the weight of the Asphalt Cement to be paid for in accordance with the following formula:

English:

$$P = \% AC \times T$$

Where:

P = Pay Tons of Asphalt Cement

% AC = Lot average of % Asphalt Cement by weight of total mix as determined by extraction

T = Actual accepted tons of mixture as weighed

Metric:

$$P = \% AC \times T$$

Where:

- P = Pay megagrams of Asphalt Cement
- % AC = Lot average of % Asphalt Cement by weight of total mix as determined by extraction
- T = Actual accepted megagrams of mixture as weighed

4. **By Digital Recording Device:** The amount of bituminous material as shown on the printed tickets will be the Pay Quantity.

B. By Volume

The volume will be measured and corrected for the difference between actual temperature and 60 °F (15 °C). Containers shall be level when measured, and one of the following methods shall be used, whichever is best suited to the circumstances:

1. **Tank Car Measurement:** If the material is shipped to the Project in railroad tank cars, the Contractor shall furnish the Engineer a certified chart showing the dimensions and volume for each inch (25 mm) of depth for each tank. The Engineer will make outage and temperature measurements before unloading is begun and after it is finished. The measurements will be taken when the bituminous material is at a uniform temperature and free from air bubbles. The Contractor shall not remove any bituminous material from any tank until necessary measurements have been made nor shall he release the car until final outage has been measured. The total number of gallons (liters) allowed for any tank car shall not be more than the U.S. Interstate Commerce Commission rating for that car, converted to gallons at 60 °F (15 °C).
2. **Truck Measurement:** If bituminous materials are delivered to the Project in tank trucks, distributor tanks, or drums, the Contractor shall not remove any bituminous material from the transporting vehicle or container until necessary measurements have been made, nor shall the transporting vehicle or container be released until final outage has been measured. If weighing is not convenient, the Contractor shall furnish the Engineer with a certified chart showing the dimensions and volume of each container together with a gauge or calibrated measuring rod which will permit the volume of the material to be determined by vertical measurement.
3. **Metering:** The volume may be determined by metering, in which case the metering device used and the method of using it shall be subject to the approval of the Engineer.
4. **Time of Deliveries:** The arrival and departure of vehicles delivering bituminous materials to the Project site shall be so scheduled that the Engineer is afforded proper time for the measurements of delivered volume and final outage. The Engineer will make the necessary measurements only during the Contractor’s normal daily working hours.

C. Production for Multiple Projects

When a Contractor is producing Asphaltic Concrete from one plant, which is being placed on two or more jobs, public or private, the amount of bituminous material used may be determined by extraction tests in accordance with Subsection 109.02.A.3 or digital recording device in accordance with Subsection 109.02.A.4.

D. Tack Coat

When the same storage facility is utilized for Bituminous Materials to be used in Hot Mix Asphaltic Concrete, Bituminous Tack Coat, and/or Surface Treatment, the quantity used for Tack Coat shall be converted to tons (megagrams) and deducted from the quantities for the Bituminous Material used in the Hot Mix Asphaltic Concrete and Surface Treatment.

E. Corrections

When the volume and temperature have been determined as defined above, the volume will be corrected by the use of the following formula:

$$V_{\text{English}} = \frac{V1}{K(t-60) + 1} \qquad V_{\text{metric}} = \frac{V1}{K(t-15) + 1}$$

Where:

- V = Volume of bituminous material at 60 °F (15 °C)
- V1= Volume of hot bituminous material
- t = Temperature of hot bituminous material in degrees Fahrenheit (Celsius)
- K= Coefficient of Expansion of bituminous material (correction factor)

The correction factors K for various materials are given below:

- 0.00035 (0.00063) per °F (°C) for petroleum oils having a specific gravity of 60 °F/60 °F (15 °C/15 °C) above 0.966
- 0.00040 (0.00072) per °F (°C) for petroleum oils having a specific gravity of 60 °F/60 °F (15 °C/15 °C) between 0.850-0.966
- 0.00030 (0.00054) per °F (°C) for Tar
- 0.00025 (0.00045) per °F (°C) for Emulsified Asphalt
- 0.00040 (0.00072) per °F (°C) for Creosote Oil

109.03 Scope of Payment

The Contractor shall receive and accept the compensation provided for in the Contract as full payment for furnishing all materials, labor, tools, equipment, superintendence and incidentals, and for performing all work contemplated and embraced under the Contract in a complete and acceptable manner, for any infringement of patent, trademark or copyright, for all loss or damage arising from the nature of The Work, or from the action of the elements, for all expenses incurred by or in consequence of the suspension or discontinuance of The Work, or from any unforeseen difficulties which may be encountered during the prosecution of The Work and for all risks of every description connected with the prosecution of The Work until its Final Acceptance by the Engineer, except as provided in Subsection 107.16.

The payment of any partial estimate prior to Final Acceptance of the Project as provided in Subsection 105.16 shall in no way affect the obligation of the Contractor to repair or renew any defective parts of the construction or to be responsible for all damages due to such defects.

109.04 Payment and Compensation for Altered Quantities

When alteration in Plans or quantities of work not requiring Supplemental Agreements as herein before provided for are ordered and performed, the Contractor shall accept payment in full at the Contract Unit Bid Prices for the actual quantities of work done, and no allowance will be made for increased expense, loss of expected reimbursement, or loss of anticipated profits suffered or claimed by the Contractor, resulting either directly from such alterations, or indirectly from unbalanced allocation among the Contract Items of overhead expense on the part of the Bidder and subsequent loss of expected reimbursement therefore, or from any other cause.

Compensation for alterations in Plans or quantities of work requiring Supplemental Agreements shall be as stipulated in such agreement, except that when the Contractor proceeds with The Work without change of price being agreed upon, he shall be paid for such increased or decreased quantities at the Contract Unit Prices Bid in the Proposal for the Items of The Work.

109.05 Extra Work

Extra work, as defined in Subsection 101.27, when ordered in accordance with Subsection 104.04, will be authorized in writing by the Engineer. The authorization will be in the form of a Supplemental Agreement or a Force Account.

A. Supplemental Agreement

In the case of a Supplemental Agreement, the work to be done will be stipulated and agreed upon by both parties prior to any extra work being performed.

Payment based on Supplemental Agreements shall constitute full payment and settlement of all additional costs and expenses including delay and impact damages caused by, arising from or associated with The Work performed.

B. Force Account

When no agreement is reached for Extra Work to be done at Lump Sum or Unit Prices, such work may be authorized by the Department to be done on a Force Account basis. A Force Account estimate that identifies all anticipated costs shall be prepared by the Contractor on forms provided by the Engineer. Work shall not begin until the Force Account is approved. Payment for Force Account work will be in accordance with the following:

1. **Labor:** For all labor, equipment operators and supervisors, excluding superintendents, in direct charge of the specific operations, the Contractor shall receive the rate of wage agreed upon in writing before beginning work for each and every hour that said labor, equipment operators and supervisors are actually engaged in such work.

The Contractor shall receive the actual costs paid to, or in behalf of, workers by reason of subsistence and travel allowances, health and welfare benefits, pension fund benefits, or other benefits, when such amounts are required by collective bargaining agreement or other employment contract generally applicable to the classes of labor employed on The Work.

An amount equal to 15% of the sum of the above items will also be paid the Contractor.

2. **Bond, Insurance, and Tax:** For property damage, liability, and worker's compensation insurance premiums, unemployment insurance contributions, and Social Security taxes on the Force Account work, the Contractor shall receive the actual cost, to which cost no percentage will be added. The Contractor shall furnish satisfactory evidence of the rate or rates paid for such bond, insurance, and tax.
3. **Materials:** For materials accepted by the Engineer and used, the Contractor shall receive the actual cost of such material incorporated into The Work, including Contractor paid transportation charges (exclusive of machinery rentals as hereinafter set forth), to which cost 10% will be added.
4. **Equipment:** For any machinery or special equipment (other than small tools) including fuel and lubricant, plus transportation costs, the use of which has been authorized by the Engineer, the Contractor shall receive the rental rates indicated below for the actual time that such equipment is in operation on The Work or the time, as indicated below, the equipment is directed to stand by.

Equipment rates shall be based on the latest edition of the *Rental Rate Blue Book for Construction Equipment* or *Rental Rate Blue Book for Older Construction Equipment*, whichever applies, as published by EquipmentWatch using all instructions and adjustments contained therein and as modified below.

Allowable Equipment Rates shall be established as defined below:

- Allowable Hourly Equipment Rate = Monthly Rate/176 x Adjustment Factors.
- Allowable Hourly Operating Cost = Hourly Operating Cost.
- Allowable Rate Per Hour = Allowable Hourly Equipment Rate + Allowable Hourly Operating Cost.
- Standby Rate = Allowable Hourly Equipment Rate x 35%

NOTE: The monthly rate is the basic machine plus any attachments.

Standby rates shall apply when equipment is not in operation and is directed by the Engineer to standby for later use. In general, Standby rates shall apply when equipment is not in use, but will be needed again to complete The Work and the cost of moving the equipment will exceed the accumulated standby cost. Payment for standby time will not be made on any day the equipment operates for 8 or more hours. For equipment accumulating less than 8 hours operating time on any normal workday, standby payment will be limited to only that number of hours which, when added to the operating time for that day equals 8 hours. Standby payment will not be made on days that are not normally considered workdays.

The Department will not approve any rates in excess of the rates as outlined above unless such excess rates are supported by an acceptable breakdown of cost.

Payable time periods will not include:

- Time elapsed while equipment is broken down
- Time spent in repairing equipment, or
- Time elapsed after the Engineer has advised the Contractor the equipment is no longer needed

If a piece of equipment is needed which is not included in the above *Blue Book* rental rates, reasonable rates shall be agreed upon in writing before the equipment is used. All equipment charges by persons or firms other than the Contractor shall be supported by invoices.

Transportation charges for each piece of equipment to and from the site of The Work will be paid provided:

- The equipment is obtained from the nearest approved source
- The return charges do not exceed the delivery charges
- Haul rates do not exceed the established rates of licensed haulers, and
- Such charges are restricted to those units of equipment not already available and not on or near the Project

No additional compensation will be made for equipment repair.

5. **Miscellaneous:** No additional allowance will be made for general superintendence, the use of small tools, or other costs for which no specific allowance is herein provided.
6. **Compensation:** The Contractor's representative and the Engineer shall compare records and agree on the cost of work done as ordered on a Force Account basis at the end of each day on forms provided by the Department.
7. **Subcontract Force Account Work:** For work performed by an approved Subcontractor or Second-tier Subcontractor, all provisions of this Section (109.05) that apply to the Prime Contractor in respect to labor, materials and equipment shall govern. The prime Contractor shall coordinate the work of his Subcontractor. The prime Contractor will be allowed an amount to cover administrative cost equal to 5% of the Subcontractor's amount earned but not to exceed \$5,000.00 per Subcontractor. Markup for Second-tier Subcontract work will not be allowed.

Should it become necessary for the Contractor or Subcontractor to hire a firm to perform a specialized type of work or service which the prime Contractor or Subcontractor is not qualified to perform, payment will be made at reasonable invoice cost. To each invoice cost a markup to cover administrative cost equal to 5% of the total invoice but not to exceed \$5,000.00 will be allowed the Contractor or Subcontractor but not both.

8. **Statements:** No payment will be made for work performed on a Force Account basis until the Contractor has furnished the Engineer with duplicate itemized statements of the cost of such Force Account work detailed as follows:
 - a. Name, classification, date, daily hours, total hours, rate, and extension for each laborer, equipment operator, and supervisor, excluding superintendents.
 - b. Designation, dates, daily hours, total hours, rental rate, and extension for each unit of machinery and equipment.
 - c. Quantities of materials, prices, and extensions.
 - d. Transportation of materials.
 - e. Cost of property damage, liability, and worker's compensation insurance premiums, unemployment insurance contributions, and Social Security tax.

Statements shall be accompanied and supported by invoices for all materials used and transportation charges. However, if materials used on the Force Account work are not purchased specifically for such work but are taken from the Contractor's stock, then, in lieu of the invoices, the Contractor shall furnish an affidavit certifying that such materials were taken from his stock, that the quantity claimed was actually used, and that the price and transportation claimed represent the actual cost to the Contractor.

Payment based on Force Account records shall constitute full payment and settlement of all additional costs and expenses including delay and impact damages caused by, arising from or associated with The Work performed.

109.06 Eliminated Items

Should any Items contained in the Proposal be found unnecessary for the proper completion of The Work, the Engineer may, upon written order to the Contractor, eliminate such Items from the Contract, and such action shall in no way invalidate the Contract. When a Contractor is notified of the elimination of Items, he will be reimbursed for actual work done and all costs incurred, including mobilization of materials prior to said notifications.

109.07 Partial Payments

A. General

At the end of each calendar month, the total value of Items complete in place will be estimated by the Engineer and certified for payment. Such estimate is approximate only and may not necessarily be based on detailed measurements. Value will be computed on the basis of Contract Item Unit Prices or on percentage of completion of Lump Sum Items.

When so requested by the Contractor and approved by the Engineer, Gross Earnings of \$500,000.00 or more for work completed within the first 15 days of any month will be certified for payment on a semi-monthly basis subject to the conditions and provisions of Subsection 109.07.A, Subsection 109.07.B.6, Subsection 109.07.C, Subsection 109.07.D, Subsection 109.07.E, and Subsection 109.07.F.

B. Materials Allowance

Payments will be made on delivered costs, or percentage of bid price if otherwise noted, with copies of paid invoices provided to the Department for the materials listed below which are to be incorporated into the Project provided the materials:

- Conform to all Specification requirements.
- Are stored on the Project Right-of-Way or, upon written request by the Contractor and written approval of the Engineer, they may be stored off the Right-of-Way, but local to the Project, provided such storage is necessary due to lack of storage area on the Right-of-Way, need for security, or need for protection from weather.

As a further exception to on-Project storage, upon written request by the Contractor, the Engineer may approve off-the-Project storage items uniquely fabricated or precast for a specific Project, such as structural steel and precast concrete, which will be properly marked with the Project number and stored at the fabrication or precast facility.

The Engineer may approve out-of-state storage for structural steel and prestressed concrete beams uniquely fabricated for a specific Project stored at the fabrication facility.

1. Paid invoices should accompany the materials allowance request, but in no case be submitted to the Project Engineer later than 30 calendar days following the date of the progress payment report on which the materials allowance was paid.

In case such paid invoices are not furnished within the established time, the materials allowance payment will be removed from the next progress statement and no further materials allowance will be made for that item on that Project.

2. Materials allowances will be paid for those items which are not readily available, and which can be easily identified and secured for a specific project and for which lengthy stockpiling periods would not be detrimental. Some exclusions are as follows:
 - a. No payments will be made on living or perishable plant materials until planted.
 - b. No payments will be made on Portland Cement, Liquid Asphalt, or Grassing Materials.
 - c. No payment will be made for aggregate stockpiled in a quarry. Payment for stockpiled aggregate will be made only if the aggregate is stockpiled on or in the immediate vicinity of the project and is held for the exclusive use on that project. The aggregate must be properly secured. If the aggregate stockpiled is to be paid for per-ton (megagram) it must be reweighed on approved scales at the time it is incorporated into the Project.
 - d. No payments will be made on minor material items, hardware, etc.
3. No materials allowance will be made for materials when it is anticipated that those materials will be incorporated into The Work within 30 calendar days.
4. No materials allowance will be made for a material when the requested allowance for such material is less than \$25,000.
5. Where a storage area is used for more than one project, material for each project shall be segregated from material for other projects, identified, and secured. Adequate access for auditing shall be provided. All units shall be stored in a manner so that they are clearly visible for counting and/or inspection of the individual units.
6. The Commissioner may, at his discretion, grant waiver to the requirements of this Section when, in his opinion, such waiver would be in the public interest.

Subsequently, in the event the material is not on-hand and in the quantities for which the materials allowance was granted, the materials allowance payment will be removed from the next progress statement and no further materials allowance will be made for those items on that Project. If sufficient earnings are not available on the next progress statement, the Contractor agrees to allow the Department to recover the monies from any other Contract he may have with the Department, or to otherwise reimburse the Department.

Payments for materials on hand shall not exceed the invoice price or 75 percent of the bid prices for the pay items into which the materials are to be incorporated, whichever is less.

C. Minimum Payment

No partial payment will be made unless the amount of payment is at least \$1000.00.

D. Liquidated Damages

Accrued liquidated damages will be deducted in accordance with Subsection 108.08.

E. Other Deductions

In addition to the deductions provided for above, the Department has the right to withhold any payments due the Contractor for items unpaid by the Contractor for which the Department is directly responsible, including, but not limited to, royalties (see Section 106).

F. Amount of Payment

The balance remaining after all deductions provided for herein have been made will be paid to the Contractor. Partial estimates are approximate and are subject to correction on subsequent progress statements. If sufficient earnings are not available on the subsequent progress statement, the Contractor agrees to allow the Department to recover the monies from any other Contract he may have with the Department, or to otherwise reimburse the Department. The Engineer is responsible for computing the amounts of all deductions herein specified, for determining the progress of the Work and for the items and amounts due to the Contractor during the progress of the Work and for the final statement when all Work has been completed.

G. Interest

Under no circumstances will any interest accrue or be payable on any sums withheld or deducted by the Department as authorized by Subsection 109.07.A, Subsection 109.07.B.6, Subsection 109.07.C, Subsection 109.07.D, Subsection 109.07.E, and Subsection 109.07.F.

H. Insert the Following in Each Subcontract

The Contractor shall insert the following in each Subcontract entered into for work under this Contract:

“The Contractor shall not withhold any retainage on Subcontractors. The Contractor shall pay the Subcontractor 100% percent of the gross value of the Completed Work by the Subcontractor as indicated by the current estimate certified by the Engineer for payment.”

Neither the inclusion of this Specification in the Contract between the Department and the Prime Contractor nor the inclusion of the provisions of this Specification in any Contract between the Prime Contractor and any of his Subcontractors nor any other Specification or Provision in the Contract between the Department and the Prime Contractor shall create, or be deemed to create, any relationship, contractual or otherwise, between the Department and any Subcontractor.

109.08 Final Payment

When Final Inspection and Final Acceptance have been made by the Engineer as provided in Subsection 105.16, the Engineer will prepare the Final Statement of the quantities of the various classes of work performed. All prior partial estimates and payments shall be subject to correction in the Final Statement. The District Engineer will transmit a copy of the Statement to the Contractor by Registered or Certified Mail. The Contractor will be afforded 20 days in which to review the Final Statement in the District Office before it is certified for payment by the Engineer. Any adjustments will be resolved by the District Engineer or in case of a dispute referred to the Chief Engineer whose decision shall be final and conclusive. After approval of the Final Statement by the Contractor, or after the expiration of the 20 days, or after a final ruling on disputed items by the Chief Engineer, the Final Statement shall be certified to the Treasurer by the Chief Engineer stating the Project has been accepted and that the quantities and amounts of money shown thereon are correct, due and payable.

The Treasurer, upon receipt of the Engineer’s certification, shall in turn furnish the Contractor with the Department’s Standard Release Form to be executed in duplicate. The aforesaid Release Form, showing the total amount of money due the Contractor, shall be sent to the Contractor by Registered or Certified Mail, to be delivered to such Contractor upon the signing of a return receipt card, to be returned to the Department in accordance with the provision of Federal law in respect to such matters and such return receipt card shall be conclusive evidence of a tender of said sum of money to the Contractor. Upon receipt of the properly executed Standard Release Form, the Treasurer shall make final payment jointly to the Contractor and his Surety. The aforesaid certification, executed release form, and final payment shall be evidence that the

Commissioner, the Engineer, and the Department have fulfilled the terms of the Contract, and that the Contractor has fulfilled the terms of the Contract except as set forth in his Contract Bond.

The Standard Release Form is to be executed by the Contractor within 120 days after delivery thereof, as evidenced by the Registered or Certified Mail Return Receipt. Should the Contractor fail to execute the Standard Release Form because he disputes the Final Payment as offered, or because he believes he has a claim for damages or additional compensation under the Contract, the Contractor shall, within 120 days after delivery to the Contractor of the Standard Release Form, as evidenced by the Registered or Certified Mail Return Receipt, enter suit in the proper court for adjudication of his claim. Should the Contractor fail to enter suit within the aforesaid 120 days, then by agreement hereby stipulated, he is forever barred and stopped from any recovery or claim whatsoever under the terms of this Contract.

Should the Contractor fail to execute the Standard Release Form or file suit within 120 days after delivery thereof, then the Surety on the Contractor's Bond is hereby constituted the attorney-in-fact of the Contractor for the purpose of executing such final releases as may be required by the Department, including but not limited to the Standard Release Form, and for the purpose of receiving the Final Payment under this Contract.

The Department reserves the right as defined in Subsection 107.20, should an error be discovered in any estimates, to claim and recover from the Contractor or his Surety, or both, such sums as may be sufficient to correct any error of overpayment. Such overpayment may be recovered from payments due on current active Projects or from any future State work done by the Contractor.

The foregoing provisions of this Section shall be applicable both to the Contractor and the Surety on his Bond; and, in this respect, the Surety shall be bound by the provisions of Subsection 108.09 of these Specifications in the same way and manner as the Contractor.

A. Interest

In the event the Contractor fails to execute the *Standard Release Form* as prepared by the Treasurer because he disputes the amount of the final payment as stated therein, the amount due the Contractor shall be deemed by the Contractor and the Department to be an unliquidated sum and no interest shall accrue or be payable on the sum finally determined to be due to the Contractor for any period prior to final determination of such sum, whether such determination be by agreement of the Contractor and the Department or by final judgement of the proper court in the event of litigation between the Department and the Contractor. The Contractor specifically waives and renounces any and all rights it may have under Section 13-6-13 of the Official Code of Georgia and agrees that in the event suit is brought by the Contractor against the Department for any sum claimed by the Contractor under the Contract, for delay damages resulting from a breach of contract, for any breach of contract or for any extra or additional work, no interest shall be awarded on any sum found to be due from the Department to the Contractor in the final judgement entered in such suit. All final judgements shall draw interest at the legal rate, as specified by law. Also, the Contractor agrees that notwithstanding any provision or provisions of Chapter 11 of Title 13 of the Official Code of Georgia that the provisions of this contract control as to when and how the Contractor shall be paid for The Work. Further, the Contractor waives and renounces any and all rights it may have under Chapter 11 of Title 13 of the Official Code of Georgia.

B. Termination of Department's Liability

Final payment will be in the amount determined by the statement as due and unpaid. The acceptance of the final payment or execution of the Standard Release Form or failure of the Contractor to act within 120 days as provided herein after tender of payment, or final payment to the Contractor's Surety in accordance with the provisions stipulated herein, shall operate as and be a release to the Department, the Commissioner, and the Engineer from all claims of liability under this contract and for any act or neglect of the Department, the Commissioner, or the Engineer.

109.09 Termination Clause

A. General

The Department may, by written notice, terminate the Contract or a portion thereof for the Department's convenience when the Department determines that the termination is in the State's best interest, or when the Contractor is prevented from proceeding with the Contract as a direct result of one of the following conditions:

1. An Executive Order of the President of the United States with respect to the prosecution of war or in the interest of national defense.
2. The Engineer and Contractor each make a determination, that, due to a shortage of critical materials required to complete the Work which is caused by allocation of these materials to work of a higher priority by the Federal Government or any agency thereof, it will be impossible to obtain these materials within a practical time limit and that it would be in the public interest to discontinue construction.
3. An injunction is imposed by a court of competent jurisdiction which stops the Contractor from proceeding with the Work and causes a delay of such duration that it is in the public interest to terminate the Contract and the Contractor was not at fault in creating the condition which led to the court's injunction.
The decision of the Engineer as to what is in the public interest and as to the Contractor's fault, for the purpose of Termination, shall be final.
4. Orders from duly constituted authority relating to energy conservation.

B. Implementation

When, under any of the conditions set out in Subsection A of this Section, the Contract, or any portion thereof, is terminated before completion of all Items of Work in the Contract, the Contractor shall be eligible to receive some or all of the following items of payment:

1. For the actual number of units of Items of Work completed, payment will be made at the Contract Unit Price.
2. Reimbursement for organization of the Work and moving equipment to and from the job will be considered where the volume of work completed is too small to compensate the Contractor for these expenses under the Contract Unit Prices. However, the Engineer's decision as whether or not to reimburse for organization of the Work and moving equipment to and from the job, and in what amount, shall be final.
3. Acceptable materials, obtained by the Contractor for the Work, that have been inspected, tested, and accepted by the Engineer, and that are not incorporated in the Work will, at the request of the Contractor, be purchased from the Contractor at actual cost as shown by receipted bills and actual cost records at such points of delivery as may be designated by the Engineer. This will include any materials that have been delivered to the project site or that have been specifically fabricated for the project and are not readily usable on other projects. It will not include materials that may have been ordered, but not delivered to the project site and that are readily usable on other projects (e.g., guard rail, stone, lumber, etc.).
4. For Items of Work partially completed, payment adjustments including payments to afford the Contractor a reasonable profit on work performed, may be made as determined by the Engineer based upon a consideration of costs actually incurred by the Contractor in attempting to perform the Contract.
5. No payment will be made, and the Department will have no liability, for lost profits on Work not performed. In particular, the Department will not be liable to the Contractor for all profits the Contractor expected to realize had the Project been completed, nor for any loss of business opportunities, nor for any other consequential damages.
6. In order that the Department may make a determination of what sums are payable hereunder, the Contractor agrees that, upon termination of the Contract, it will make all of its books and records available for inspection and auditing by the Department.

To be eligible for payment, costs must have been actually incurred, and must have been recorded and accounted for according to generally accepted accounting principles, and must be items properly payable under Department policies. Where actual equipment costs cannot be established by the auditors, payment for unreimbursed equipment costs will be made in the same manner as is provided in Subsection 109.05 for Force Account Work. Idle time for equipment shall be reimbursed at standby rates. In no case will the Contractor be reimbursed for idle equipment after the Engineer has advised the Contractor the equipment is no longer needed on the job. Refusal of the Contractor to allow the Department to inspect and audit all of the Contractor's books and records shall conclusively establish that the Department has no liability to the Contractor for any payment under this provision, and shall constitute a waiver by the Contractor of any claim for damages allegedly caused by breach or termination of the Contract. The amount payable under this provision, if any, is to be determined by the Engineer, whose determination will be final and binding.

7. The sums payable under this Subsection shall be the Contractor's sole and exclusive remedy for termination of the Contract.

C. Termination of a Contract

Termination of a Contract or a portion thereof shall not relieve the Contractor of his responsibilities for any completed portion of the Work, nor shall it relieve his Surety of its obligation for and concerning any just claims arising out of the Work performed.

109.10 Interest

In the event any lawsuit is filed against the Department alleging the Contractor is due additional money because of claims or for any breach of contract, the Contractor hereby waives and renounces any right it may have under O.C.G.A. Section 13-6-13 to prejudgment interest. Also, the Contractor agrees that notwithstanding any provision or provisions of Chapter 11 of Title 13 of the Official Code of Georgia that the provisions of this contract control as to when and how the Contractor shall be paid for The Work. Further, the Contractor waives and renounces any and all rights it may have under Chapter 11 of Title 13 of the Official Code of Georgia.

Section 148—Pilot Vehicles

148.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 149—Construction Layout

149.1 General Description

Perform construction layout to guide and control performance of items of the work according to this Specification.

This work includes:

- Placing, replacing (if necessary), and maintaining construction layout points.
- Preparing construction layout drawings, sketches, and computations.
- Recording data in field books such as alignment, slope stake, blue top, drainage layout, bridge, and other books used for layout for this Project.

149.1.01 Definitions

General Provisions 101 through 150

149.1.02 Related References

A. Standard Specifications

General Provisions 101 through 150

B. Referenced Documents

General Provisions 101 through 150

149.1.03 Submittals

Submit the following documentation to the Department:

A. Project Construction Records

These records detail information that the Department uses to determine the template line for the as-built cross sections, which defines the computation line for unclassified excavation. These records include:

- Survey records
- Bound field notebooks
- Computer printouts that record the Project's construction

Prepare the records as directed by the Engineer.

B. Survey Documents

Furnish the Engineer with a copy of survey documents that relate to construction layout. Provide these documents when the Engineer requests or as they are completed. The Engineer may check the documents for accuracy and may require revisions where necessary. The documents become Department property and will be included in the permanent Project records.

C. Drainage Structure Sketches

Profile both inlet and outlet ends of proposed drainage structures for at least 100 ft (30 m) in the existing ditch line or stream bed. Adjust flowline elevations, if necessary, to enhance the hydraulics and to reduce silting, scouring, or backwater.

Calculate the length of each structure and provide sketches of the structure to the Engineer for review and approval at least 24 hours before beginning the work.

D. Bridge Layout Sketch

Furnish a layout sketch before staking on bridges. After staking, submit a revised sketch for the Engineer's review and approval before beginning construction. Include in the layout sketch relevant stations, angles, dimensions, and redundant checks including exterior beam dimensions in each span. Also include all horizontal and vertical clearances with calculations that verify the clearances shown.

Submit for the Engineer's review and approval survey data and calculations with the layout sketch and information required for bent construction.

Verify the Plan elevations for all bridge bearing seats on the substructure.

E. Wall Layout Sketches

Submit sketches and other data verifying either that the wall will fit the final field conditions, or indicate where revisions are necessary. Submit these sketches well before the wall construction begins so the Engineer can make any necessary structural design changes.

149.2 Materials

General Provisions 101 through 150

149.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150

149.3 Construction Requirements

General Provisions 101 through 150

149.3.01 Personnel

Furnish personnel capable of establishing line and grade points necessary to complete the work. Establish these points within the generally accepted surveying tolerances, and ensure that they are acceptable for the work being performed.

149.3.02 Equipment

Furnish surveying equipment, stakes, and all materials necessary to perform the work, subject to the Engineer's approval.

149.3.03 Preparation

A. General Pre-Construction

Before beginning construction:

1. Ensure that plan dimensions, alignment, and elevations are compatible with existing field conditions. Make adjustments where necessary.
2. Ensure alignment tie-ins by coordinating construction layout with that of other Contractors whose work abuts any portion of the work. All adjustments are subject to the Engineer's approval.

B. Widening and Reconstruction

Before beginning construction where existing pavement is to be retained either for widening or for reconstruction:

1. Take three-point levels of the pavement throughout the length to be retained.
Normally, the three-point levels will be required at 50 ft (15 m) intervals. However, the Engineer may adjust these intervals according to existing field conditions. Three-point levels are not required on asphalt shoulder widening projects and earth shoulder reconstruction projects.
2. From the three-point levels, prepare a graphic grade plot that "best fits" the existing pavement to minimize the leveling requirements (if any) of the existing roadway. Cross slopes may be varied within the ranges shown on the Plans or adjusted by the Engineer to produce the "best fit."
3. On passing lane or widening Projects where existing pavement is not to be overlaid:
 - a. Profile and plot the outside edge of the existing pavement to obtain a smooth profile grade.
 - b. Transfer this grade to the new edge of paving using the proper cross slope.
4. Furnish data to the Engineer for approval before beginning widening and reconstruction.
5. On widening, reconstruction, or passing lane projects, obtain the Engineer's approval of the "best fit" profile. Ensure that grade stakes are set to control the construction of any required widening based upon the "best fit" profile and cross slope. Construct proposed widening flush with the existing edge of paving. Provide positive drainage in all cases.

C. Existing Bridge Widening or Modification

To widen or modify existing bridges, do the following before ordering materials or beginning construction:

1. Verify existing elevations and dimensions as well as confirm or determine required new cap elevations.
2. Profile the removal line and cross section the existing deck.
3. Use this profile information to determine a "best fit" finished grade for the widened portion.
4. Compute the new cap elevations based on this "best fit" information.
5. Furnish survey data, layout sketch, and calculations to the Engineer for approval.

D. Retaining Wall Construction Layout

Set stakes, take necessary cross sections, and perform necessary calculations at each wall before beginning wall construction to ensure that the geometric design of the retaining wall conforms to actual conditions.

149.3.04 Fabrication

General Provisions 101 through 150

149.3.05 Construction

A. Verify Plan Elevations

Verify plan elevations for all bridge bearing seats on the substructure.

B. Verify Bent Layout

After bent construction has begun, verify bent layout at each major phase of the construction to ensure that the bent is properly positioned in relation to adjacent bents.

C. Establish the Centerline

Establish the centerline as follows:

1. Establish or reestablish the centerline from the monuments and/or reference points the Department will provide.
2. On widening or reconstruction Projects, establish the horizontal and vertical alignment of the existing roadway and bridges.
3. Modify the Plan horizontal and vertical alignment to conform to the existing alignment as necessary.

D. Verify the Accuracy of the Bench Mark(s)

The Department will furnish at least one bench mark that the Contractor shall preserve, and if necessary, relocate as follows:

- a. Verify the accuracy of the bench mark(s) and report discrepancies to the Engineer.
- b. Establish additional benchmarks needed for construction.
- c. Maintain the bench marks for necessary Department checks.

E. Flag In-Place Survey Control Monuments

Flag and protect in-place survey control monuments and reference points, including Right-of-Way/property line intersections, as follows:

1. Pay for and replace destroyed or disturbed stakes or monuments.
2. When included as Pay Items, stake Right-of-Way markers.

F. Line, Grades, and Stakes

Set other line and grade stakes needed to construct the job, including stakes needed to relocate utilities. Stake the Right – of-Way and maintain throughout the life of the project. Restake flattened slopes, minor grade or alignment changes, and other incidentals.

G. Stake Centerline Control Alignments

Stake centerline control alignments shown on the Plans or adjusted as described above when the Department needs accurate measurement of quantities for payment. Stake these control alignments as follows:

1. Stake the alignments to an accuracy of 1:5000.
2. Stake the alignments just before the Department takes aerial photography or field cross sections for both original and final cross sections.
3. Provide the Department with elevations of positions staked for the Department’s quantity measurements. Ensure that these elevations are of third order accuracy, or better. Determine them using the differential leveling method.
4. Take intermediate cross sections required because of stage construction, detours, or other reasons.

H. Provide Graphic Sketches

Prepare and use graphic sketches of superelevation runout on curves on multi-lane roadways and of tie-ins of ramps to mainline on freeways and expressways to help provide positive drainage, adequate superelevation, and a pleasing appearance. Prepare and use similar sketches for street or roadway intersections.

I. Maintain the Stakes

After construction has begun in any segment of the Project, maintain the stakes that identify construction station numbers and locations as follows:

1. Ensure that stakes are placed at intervals not to exceed 200 ft (60 m) and use even, 100 ft (30 m) stations. On asphalt shoulder widening and earth shoulder reconstruction projects use mile post numbers when stations are not used.
Mark and flag stakes so that they are visible to DOT Project personnel in that segment of the Project until construction is complete.
Projects utilizing GPS controlled fine grading equipment, place stakes at intervals not to exceed 300 ft (91 m) on English projects and 100 m (310 ft) on metric projects. Use even, 100 ft (30 m) or 100 m (310 ft), stations.
2. During grading activities in fills or cuts over 20 ft (6 m), extend slope stakes up or down the slopes in intervals of 10 ft (3 m) or less to achieve an accurate cross section.
3. Denote the offset distance to the construction centerline on the station number stakes, when the station number is maintained in a location other than on the construction centerline. On asphalt shoulder widening and earth shoulder reconstruction projects use the offset to the edge of pavement on the stakes.

J. Traffic Markings

When traffic markings are to be placed by either the Contractor or others, furnish the layout and clean and preline the surface to allow the placement of permanent pavement markings on the Project.

When traffic markings are not included in the Project plans, the Department will provide striping plans and/or standard drawings for the Contractor’s use.

K. Provide Bridge Construction Layout

Provide alignment control, grade control, and calculations to set these controls for bridge construction.

For new bridges, the Department will furnish the necessary input data forms for the Department’s “Bridge Geometry” computer program upon the Contractor’s request. The Department will process the data to help the Contractor obtain finished deck elevations.

Data processing is available only as an alternate service to determine elevations. If this service is elected for use, prepare the input data and the Department will furnish the output data. The following limitations apply:

- The Department will not assume liability for the accuracy of either input or output data.
- The Department will limit this service to two programs per bridge.
- This service is not available for existing bridges that are to be widened. Finished deck elevations for bridges that are to be widened will not be furnished.

149.3.06 Quality Acceptance

The Engineer’s acceptance of all or any part of the Contractor’s layout shall not relieve the Contractor of responsibility to secure proper dimensions for the completed work. Correct at the Contractor’s expense work incorrectly located due to layout error.

149.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150

149.4 Measurement

This item is not measured for payment.

149.4.01 Limits

General Provisions 101 through 150

149.5 Payment

This work is not paid for separately. The costs for performing layout work as described in this Specification are included in the bid for the items of work to which the layout is incidental.

Any unnecessary work, overruns, costs, etc., resulting from inaccurate data submitted by the Contractor will be deducted from Contractor payments.

149.5.01 Adjustments

General Provisions 101 through 150.

Section 150—Traffic Control

150.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 151—Mobilization

151.1 General Description

Mobilization, when listed as a pay item in the Proposal, includes preparatory work and operations, including but not limited to, moving personnel, equipment, supplies, and incidentals to the Project site. Mobilization also includes all other work and operations that shall be performed or costs incurred before beginning work on the various Items on the Project site.

151.4 Measurement

This item of work is not measured separately for payment.

151.4.01 Limits

The total sum of payments shall not exceed the original Contract amount bid for this item.

151.5 Payment

The Department will make partial payments as follows:

1. The first regular payment is 50 percent of the amount bid for mobilization, or 3 percent of the original Contract amount, whichever is less.
2. When 5 percent of the original contract amount is earned, the next progress payment is 100 percent of the amount bid for mobilization, or 3 percent of the total original contract amount, whichever is less, minus any previous payments.
3. Any amount bid for mobilization in excess of 3 percent of the original Contract amount is paid when work on the Project is complete.
4. The total sum of the payments shall not exceed the original Contract amount bid for this item.

Payment includes all costs for mobilization, demobilization, and remobilization as required to complete the work.

Payments will be made under:

152.3.05 Construction

A. Field Laboratory Physical Requirements

Provide a laboratory using a structure approved by the Engineer, such as a:

- Building
- Trailer
- Fixed building erected on the site
- Vacated house at an approved location

Each field laboratory shall house the required testing equipment and meet the minimum requirements for dimensions, space, and facilities.

Each building or trailer shall be at least 7 ft (2.1 m) wide and 7 ft (2.1 m) high inside and contain not less than 120 ft² (11 m²) of floor space. Each unit shall be floored, roofed, and weather tight and contain the following:

- At least one hinged or sliding window on each side with each window having at least 6.5 ft² (0.6 m²) of openings
- An entrance door that can be securely locked
- Built-in work table with at least two drawers (one lockable)
- Lighting and ventilation
- Heating with necessary fuel
- Potable running water
- Electric current
- Sheds and platforms required for special testing equipment
- Sanitary Facilities—Include in each field laboratory sanitary facilities that meet the requirements of the local or State Health Departments.
- Fire Extinguisher—Equip each building with at least one approved fire extinguisher that meets the following requirements:
 - 1) Multipurpose dry chemical type extinguisher
 - 2) Underwriters Laboratory rating of 4A-40BC

Mount the extinguisher(s) in a convenient and conspicuous place that is easily accessible from any part of the building. Maintain the extinguisher(s) in working condition according to the requirements of NFPA-10A.

B. Plant Laboratory Physical Requirements

Provide laboratory buildings at asphalt, concrete, or base plants. Place the buildings so that the plant is in full view from one of the windows.

C. Number of Laboratories Required

The number of laboratories shown in the Proposal is based on estimated job requirements. Actual conditions may require more or fewer. Provide the quantity as required by the Engineer at the Unit Price Bid for the facility.

D. Asphaltic Concrete Plant Laboratory Requirements

1. **Laboratory Building.** Provide a laboratory building that meets the minimum requirements for a Field Laboratory as described in Subsection 152.3.05.A.
2. **Ventilation System.** Equip the laboratory so that when the windows and doors are closed and the ventilation system is functioning as required, the temperature can be maintained between 65 °F and 80 °F (18 °C and 27 °C).
3. **Enclosures.** Provide enclosures in laboratories for procedures where extracting solvent vapors are emitted. After the asphalt is extracted, dry samples under an enclosure or inside an oven that is vented outside the lab. Provide enclosures as follows:

Equip each enclosure with the following:

- A hood, glass, or other doors capable of enclosing the extracting solvent vapors from the ambient air in the lab
- An exhaust fan located in the rear or top of the hood for each work compartment
- Replacement air provided through an open window or other opening to achieve the specified exchange of air
- Ventilation system capable of exchanging air at the rate of 100 ft³/ft²/min (30 m³/m²/min) over the entire open door area of each enclosure

Locate the laboratory ventilation, heating, and cooling systems so that the exhausted extracting solvent vapors do not re-enter the laboratory through either the heating or cooling systems.

Ensure that the extracting solvent is supplied to the laboratory through a closed-system opening only under the enclosures.

Mount the storage containers for the extracting solvent outside the laboratory and run a feed line from the container to a cut-off valve located in the enclosures. Ensure that all parts of the enclosures, hoods, and other related equipment are functional during testing.

4. **Platform.** Provide a safe platform to the proper height for the Inspector to use to obtain asphalt mix or base samples and to inspect mixes in the truck beds.
5. **Testing Equipment.** Furnish and maintain in good condition at the field laboratory the following testing equipment. All testing equipment is subject to the Engineer's approval.
 - a. One each—Oven (mechanical convection, range to 400 °F (204 °C). Comparable to Blue M Model OV-560A-2.

NOTE: Vent the oven exhaust outside the laboratory.
--

- b. One each—Sieve Shaker (Ro-Tap design or approved equal). Designed for Standard 8 in (203 mm) diameter sieve.
- c. One each—
 - Computer, IBM or IBM Compatible
 - 540 Megabyte Hard Disk Drive (Minimum)
 - 3 ½ inch (90 mm) High Density Floppy Disk Drive
 - CD-ROM Drive (4X Minimum)
 - Mouse
 - Modem 9600 Baud (Minimum)
 - 1 Parallel and 2 Serial Ports
 - 16 Megabyte Random Access Memory Expandable to at Least 32 Megabytes
 - VGA Monitor
 - 486 Microprocessor Operating at 33 Megahertz (Minimum)
- d. One each—Printer (Desk Jet HP Letter Quality Printer)
- e. One each—Electronic balance with weighing capacity of at least 26.45 lb. (12,000 grams) with digital display, and sensitivity to meet requirements of AASHTO T166 and AASHTO T209. The weighing device shall have a suspension apparatus which meets requirements of AASHTO T166.
- f. * One each—Superpave Gyrotory Compactor (SGC) Equipment-A Superpave Gyrotory Compactor and appurtenances, including a calibration kit, which meets equipment requirements and testing protocol of a nationally recognized Superpave Center and AASHTO TP 4. The SGC shall be equipped with:
 - A printer to provide a real-time printout of the date and time of compaction, number of gyrations, and specimen height for each gyration during the compaction cycle.
 - At least two mold assemblies

- A specimen extruder
 - g. *One each—Vacuum pump flasks or bowls, fittings and other accessories as required by AASHTO T209. (A corelok device with related accessories may be substituted if approved by the Department).
 - h. *One each—Asphalt Ignition Oven which meets requirements of GDT 125 and AASHTO T309.
- *Required only for interstate Projects involving mainline traveled way that include pay items under Section 400 or Section 402.

E. Portland Cement Concrete Plant Laboratory Requirements

For Portland cement concrete plants, provide a plant laboratory building and testing and curing equipment meeting the following minimum requirements.

1. Laboratory Building. Provide a laboratory building that contains:

- Combined office/workspace measuring 300 ft² (28 m²)
- Heating and air conditioning equipment capable of maintaining an interior temperature of 70 °F (21 °C)
- Separate office space with enough space for a desk and at least two chairs
- A work table at least 2.5 ft (750 mm) wide, 5 ft (1500 mm) long, and 3 ft (900 mm) high to prepare concrete cylinders for testing
- An outside work area of at least 10 ft by 10 ft (3 m by 3 m) consisting of a concrete slab constructed level and true, with a light broom finish

2. Testing and Curing Equipment. Provide the following testing and curing equipment:

- Concrete cylinder capping equipment including molds, melting pot with ventilation and accessories, and a sufficient supply of capping compound, all meeting applicable ASTM Specifications.
- Concrete cylinder compression testing machine with a minimum capacity of 250,000 lbs (1112 kN) that meets applicable ASTM Specifications.
- Concrete cylinder curing tanks capable of maintaining 200 cylinders at 73 °F ± 3 °F (23 °C ± 1.7 °C) for a 28-day curing period.
- Concrete cylinder warm water curing tank capable of maintaining 18 cylinders at 95 °F ± 5 °F (35 °C ± 2.8 °C) for a 24-hour curing period.

Maintain the equipment in good condition and to the Engineer's approval.

152.3.06 Quality Acceptance

The dimensions specified above are minimum requirements. Minor dimensional and detail deviations are not cause for rejection if the Engineer approves of the deviation.

152.3.07 Contractor Warranty and Maintenance

Maintain each building, appurtenance, and sanitary facility as required by this Specification. Furnish electricity, water, and heating as required by this Specification.

Ownership of the building(s) remains with the Contractor. Maintaining and furnishing the buildings(s) after the date of Final Acceptance of the Project is not required.

152.4 Measurement

The actual number of field laboratories furnished according to this Specification is measured separately for each laboratory. There will be no measurement or payment for laboratories furnished at base, asphaltic concrete, or Portland cement concrete central mix plants.

152.4.01 Limits

General Provisions 101 through 150.

152.5 Payment

Each field laboratory measured for payment as described in Subsection 152.4, is paid at the Contract Unit Price bid for each laboratory.

Payment is full compensation for the cost of all foundations, buildings, sheds, platforms, utilities, maintenance, sanitary facilities, removal, razing, heat, electricity, water, and site preparation and cleanup according to this Specification.

Payment for each field laboratory is made in two installments:

Sixty-five percent of the contract price is paid when the Laboratory is ready for occupancy.

Thirty-five percent of the contract price is paid when the Department finishes using the laboratory.

Payment will be made under:

Item No. 152	Field laboratory	Per each
--------------	------------------	----------

152.5.01 Adjustments

General Provisions 101 through 150.

Section 153—Field Engineer’s Office

153.1 General Description

This work includes providing, furnishing, and maintaining field office buildings, when the Contract requires, before beginning construction and according to this Specification. The Contractor shall possess the building while the Department uses it. See Subsection 153.3.07, “Contractor Warranty and Maintenance.”

The Engineering personnel will use the building exclusively for as long as they consider necessary, but no longer than the date of Final Acceptance of the Project.

153.1.01 Definitions

General Provisions 101 through 150.

153.1.03 Submittals

Before installing Project Office signs, submit a signage plan for this work to the Engineer for approval.

153.2 Materials

Ensure that all materials are of commercial grade. Sampling and testing is not required.

153.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

153.3 Construction Requirements

153.3.01 Personnel

General Provisions 101 through 150.

153.3.02 Equipment

General Provisions 101 through 150.

153.3.03 Preparation

General Provisions 101 through 150.

153.3.04 Fabrication

Install a sign at the Department of Transportation Project Office in the format shown in Figure 1. This sign shall be plainly visible from the Project roadway. Fabricate and install the sign according to Section 636, Section 910, Section 911, Section 912, and Section 913.

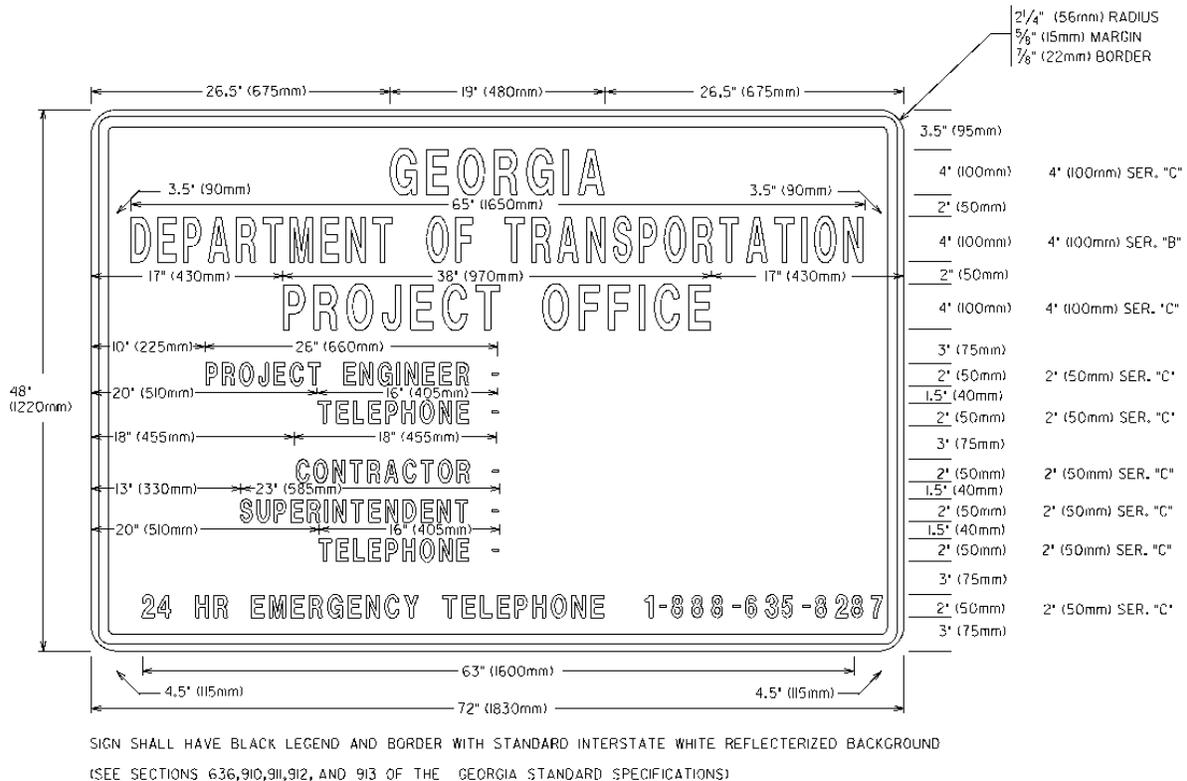

Figure 1

If the Project Office is not located adjacent to the Project roadway, install a second sign on the Project according to these specifications and as directed by the Engineer and enough guide signs to direct the traveling public to the Project Office.

Guide signs shall be 24 in (600 mm) high by 42 in (1050 mm) wide with 4 in (100 mm) high lettering and shall include a directional arrow. The guide sign shall have a white legend with a blue background. Refer to Figures 2 and 3.

Before installing the signs, submit a signage plan to the Engineer for this work.

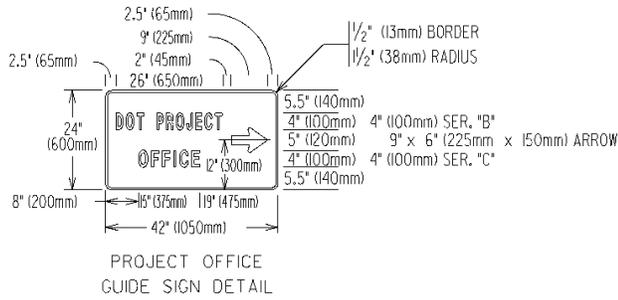

Figure 2

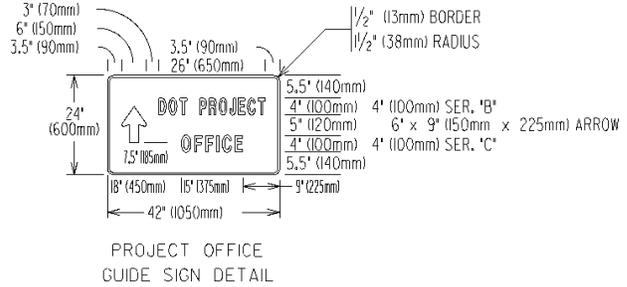

Figure 3

153.3.05 Construction

A. Field Engineer's Office Location

Field office buildings are designated as Type 1 or Type 3.

- Office Building Type 1:** Place this office within or near the project limits as directed by the Engineer. As the work progresses the offices may be moved to other locations at the Engineer's direction.
- Office Building Type 3:** Place this office either within the Project limits or near the Project at the Engineer's direction. When electric current is required, place the building within 1000 ft (300 m) of a power line if possible. If power lines are farther than 1000 ft (300 m) away, payment is made according to Subsection 153.5.

If the office buildings cannot be placed within the Project limits, acquire sites outside the Project limits.

B. Building Requirements

The Field Engineer's office may be a building, house, mobile office, or trailer if it is approved and conforms closely to this Specification. Ensure that the office building meets the following minimum requirements:

- Dimensions:** All measurements shown are clear inside dimensions.

	Constructed on Project			Commercially Produced		
	In Linear Feet (Meters)			In Linear Feet (Meters)		
Building	Width	Length	Head-room	Width	Length	Head-room
Type 1	8 (2.44)	10 (3.05)	8 (2.44)	7 ft 6 in (2.29)	9 ft 6 in (2.93)	7 (2.13)
Type 3	12 (3.66)	50 (15.24)	8 (2.44)	11 ft 6 in (3.51)	49 ft 6 in (15.09)	7 (2.13)

- Doors and Windows:** Ensure that each building has at least one standard height solid entrance door with a lock and a self-closing screen door. Type 3 buildings shall have at least two doors and screens.

Each wall, unless predominately occupied by a door, shall have at least one hinged, jalousied, or sliding window that is glazed, screened, and fitted with venetian blinds. Each window shall measure at least 6.5 ft² (0.6 m²), except the window in the toilet area which may be 3.25 ft² (0.3 m²).

The window requirements for each office building type include:

- At least 3 windows for Type 1 buildings.
- At least 10 windows for Type 3 buildings.

- Walls and Roof:** If the building is constructed on the Project, construct the walls and roofs of all building types with studs and rafters measuring 2 in by 4 in (38 mm by 89 mm).

Include in the walls and ceilings insulating material that is at least 1 1/4 in (32 mm) thick and made of rock wool, fiberglass, or other non-flammable material. Ensure that this material is in all inner wall and ceiling cavities.

- a. **Walls:** Cover both sides of the walls with 3/8 in (10 mm) plywood (exterior grade on the outside). No open cracks or knotholes are permitted. Standard wall construction is accepted if the walls are commercially produced.
- b. **Roof:** Ensure that the roof is watertight and has a minimum slope of 1:12 in one direction, away from the door. Ensure that the roof's eaves are at least 12 in (300 mm). If the building is commercially produced, an arched roof without eaves is acceptable.
4. **Ceiling:** Cover the ceiling on all building types on the inside of the roof rafters with 3/8 in (10 mm) plywood if constructed on the project. A standard ceiling will be accepted if the building is commercially produced.
5. **Floor:** Ensure that the floor is a minimum of 12 in (300 mm) above the ground on 2 in by 6 in (38 mm by 152 mm) joists. The floor may be timber. No open cracks or knotholes are permitted.
6. **Heater:** Provide an oil fired, gas, or electric heater. But ensure that the heater can maintain an inside minimum temperature of 72 °F (22 °C).
Properly vent oil and gas units to the outside, provide adequate outside fuel storage, and connect with suitable feed lines.
Gas units may be connected to a commercial gas main, if available.
7. **Worktable:** Provide a minimum of three (3) standard dimension desks. They shall be provided with a minimum of 1 1/8" (28mm) wood grain laminated tops with 23" (575mm) deep files and heavy-duty steel ball bearing drawers and locking center drawer. Provide one (1) 5' X 3' (1500mmX900mm) adjustable from 0 to 45 degree and 38" (950mm) high drafting table.
8. **Stools:** Provide one (1) posture stool with supportive backrest, waterfall edge seat and instant height lever (26" to 30") (650mm to 750mm). Provide a minimum of five (5) fully braced stackable full 2" (50mm) thick 16"X15" (400mmX375mm) seats with armrests and chrome frames. Provide a minimum of four (4) swivel chairs with arms and a 19"X19" (475mmX475mm) foam cushion and upholstered seat adjustable from 16 1/2" to 20" (415mm to 500mm) high.
9. **Miscellaneous Storage Shelves:** Provide 6 linear ft (1800 linear mm) of storage shelves for books, etc. If two 3 ft (900 mm) shelves are furnished, place them at least 1 ft (300 mm) apart vertically. Provide Type 3 buildings with 6 ft (1800 linear mm) of shelves in each end.
10. **Toilet Facilities:** For Type 3 buildings, provide indoor toilet facilities that meet local sanitary codes. Type 1 buildings do not have toilet facilities.
11. **Utilities:** Connect all utilities including water, sewage, gas, electricity, and telephone service to their service source, ready for use, before the Engineer's occupancy. Type 1 buildings do not have utilities. Process and pay the monthly bills for all utility services.
12. **Electric Service:** Provide 120/240 volt electric service that meets code.
13. **Air Conditioner:** For Type 3 buildings, provide an air conditioning unit capable of cooling the building to maintain an inside temperature at least 20 °F (7 °C) cooler than the outside temperature. Type 1 buildings do not have air conditioners.
14. **Fire Extinguisher:** Equip each building with at least one approved fire extinguisher that meets the following requirements:
 - Multipurpose dry chemical type extinguisher
 - Underwriters Laboratory rating 4A-40BCMount the extinguisher(s) in a convenient and conspicuous location that is easily accessible from any part of the building.
Maintain the extinguisher(s) according to the requirements of NFPA-10A.
15. **Telephone:** Provide in each Type 3 building three telephone lines. Provide two voice lines, with rollover capabilities, connected to two handsets (located on either end of the office). Provide separate telephone line for the computer, as directed by the Engineer. Install and maintain these lines for the life of the Project. Provide telephone access to the Local Area Telephone Service (LATS) only for outgoing, credit card, collect and toll free calls. Ensure that the telephones can receive incoming non-collect long distance calls.

Provide with the telephone, an automatic answering system that can give a greeting message, record incoming messages, and activate remotely.

C. Type 3 Offices

In addition to the requirements in Section B, furnish Type 3 offices with the following:

1. Project Sign—Complete as shown in Subsection 153.3.04, “Fabrication.” Install at the Department of Transportation Project Office at a location plainly visible from the Project roadway.
2. Locking File Cabinet—Provide three (3) Four-drawer, letter size, steel, fireproof, lockable, and must have at least two keys.
3. Plan Racks—Capable of holding two complete sets of Project Plans (not more than 100 sheets per hanger).
4. One Enclosed Closet—At least 3 ft by 3 ft (900 mm by 900 mm) with a lockable door and at least two keys.
5. Potable Water and Water Cooler—May be bottled water.
6. Outside Electrical Receptacle—Provide a weather-proof, exterior 220-volt electrical receptacle attached to a power source.
7. Chain Link Fence—Provide a minimum of 500 feet (150m) of 6 ft. (1.8 m) high chain link fence with an extension arm and barbed wire as specified in Section 643. Equip the fence with matching gates and meeting the requirements of Section 643 and consisting of a double 7 ft. (2.1m) by 6 ft. (1.8 m) and a single 4 ft.(1.2 m) by 6 ft. (1.8 m) gate. Include a positive-type locking devices, padlock and a minimum of two keys for each gate. Ensure the fence encompasses the entire compound.
8. Security Light—Provide two 150-watt high-pressure sodium security lights with photoelectric controls. Place as directed by the Engineer.
9. Copying Machine—Furnish the Field Office with one copying machine installed and maintained for the life of the Project. Furnish copying machine having the capability of making letter-size copies (8 ½” x 11”), legal-size copies (8 ½”x 14”), two-sided copies, at least thirty copies per minute, and possess an auto-feed feature. Furnish all consumable and non-consumable supplies for the life of the Project.
10. Place and spread 200 tons (181 Mg) of aggregate surface course on the Office grounds where indicated by the Engineer to facilitate parking. Remove aggregate and grass the area upon completion of the Project.
11. Ensure that the Office is supported with concrete blocks with mortar joints and anchored with ten storm-tie-down anchors. Enclose the area between the ground and the bottom of the Office with a vinyl skirting that matches the Office’s siding.
12. Install an alarm system that includes the following items and maintain in good operating condition:
 - SRN-2000 Enforced Bionic with NAPCO Magnum Alert 850 – control box or Honeywell Vista-10P Master Control Panel with Honeywell 6150RF keypad or equivalent.
 - All doors and windows with wired contacts.
 - Outside sirens with wired contacts.
 - Tamper-proof box with wired contacts.
 - Inside sirens with wired contacts.
 - Two smoke and heat detectors.Tie all of the above equipment to a 24 hour control monitoring system (BRK –2812TH or equivalent). Use a wired keyboard system. Do not use a remote system.
Process and pay the monthly bills for the alarm system and monitoring.
13. Provide one Desktop Computer and Accessories meeting the following minimum requirements:
 - a. **Hardware:**
 - Processor – Intel Core i5-2500 3.3GHz or greater
 - Memory 8 GB RAM or larger
 - Hard Drive 250 GB or larger
 - Optical Drive – 16X +-RW

- Video - 128 MB Video memory or greater, VGA, Display Port, and DVI-port
 - Monitor – 22 LCD Monitor, Input Signal – VGA (analog), DVI-D and Display Port
 - Mouse – USB Optical Scroll Mouse
 - Keyboard – USB Standard Keyboard
- b. **Software:**
- Operating System -Windows 7 Professional Edition (64 Bit)
 - Productivity Suite – Office 2010 Professional Plus (32 Bit)
- c. **Printers:**
- HP Officejet Pro 8600 All-in-One Printer, Fax, Scanner, Copier or Dell 968w All-in-One Wireless Printer or approved equal connected so that all functions including fax capability are active. Furnish all consumable and non-consumable supplies for the life of the Project.
- d. **Uninterruptible Power Supply:**
- American Power Conversion Corporation Back-UPS ES 650 or Newpoint 750 VA Battery Backup or Equal (minimum 5 Receptacles)
- e. **DSL or Cable Broadband Internet Service:**
- Provide DSL Internet Service with static IP address or provide Cable Broadband Internet Service as directed by the Engineer. If Cable Broadband Internet Service is used, the third telephone line shall be used for the fax mode of the printer.
14. Concrete Cylinder Curing Box—Furnish a Concrete Curing Box for any project that requires the placement of concrete. The curing box and its components shall be constructed of non-corroding materials and shall be capable of storing a minimum of 22 test cylinders, 6 inch x 12 inch (150 mm x 300 mm) stored vertically with the lid closed. Additional capacity may be required on large projects at the direction of the Engineer. The curing box shall be equipped with heating/cooling capabilities, automatic temperature control, and a maximum/minimum (high/low) temperature readout. The curing box shall be capable of meeting the moisture and temperature requirements of AASHTO T 23.

153.3.06 Quality Acceptance

General Provisions 101 through 150.

153.3.07 Contractor Warranty and Maintenance

Whether the building is owned, leased, or rented, the Contractor who provides the building retains possession of each office building.

The Engineer will control the use, location, relocation, and removal of the building. When the building is no longer needed, remove each building from the Project at the Engineer's direction.

Retain possession of all items that are required as part of the Field Office when the Engineer determines that these items are no longer needed.

153.4 Measurement

Field Engineer's offices Types 1 and 3, as required by the Engineer, will be paid for per each; provided each was moved to or constructed on the Project according to the Specifications.

153.4.01 Limits

The offices are measured for payment on each project one time only regardless of the number of times they are moved at the Engineer's direction.

153.5 Payment

The use of each office building (Types 1 and 3) eligible for payment is paid for at the Contract Unit Price bid. Payment is full compensation for the cost of the location, materials, design, construction, furnishings, maintenance, fuel, water, sewage disposal, electricity, telephone service (when required) , movements within the Project, and movement to and from the Project.

When electric current is required, the cost of necessary transformers is included in the price bid for Type 3 office buildings. Any cost incurred for carrying electric current over 1000 ft (300 m) from a power line is paid for by Force Account.

Payment for each Field Engineer's office is made in two installments:

- 65 percent of the Contract Price is paid when the office is ready for occupancy.
- 35 percent is paid when the Department has finished using the office.

Payment will be made under:

Item No. 153	Field Engineer's office type 1	Per each
Item No. 153	Field Engineer's office type 3	Per each

Section 154—Construction Vibration Monitoring

154.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 155—Insect Control

155.1 General Description

The Plant Pest Control Division of the U.S. Department of Agriculture and the Georgia State Department of Agriculture restricts the movement of certain items (see Subsection 155.3.05.A, "Do Not Move Material from an Infested Area") from areas infested with Japanese Beetles or Imported Fire Ants to prevent the spread of these pests to non-infested areas.

155.3.04 Fabrication

General Provisions 101 through 150.

155.3.05 Construction

The project is in an infested area unless noted otherwise.

A. Do Not Move Material from an Infested Area

Do not move the following materials from an infested area into a noninfested area without the approval of the Department of Agriculture Inspector in Charge:

- Soil, mulch, or sod
- Plants with soil attached
- Stump wood or timber with soil attached

If the Plans show limits within which infested materials may be placed, do not haul materials beyond these limits without the Inspector's approval.

B. Clean Earth-Moving Equipment

Clean soil deposits from earth-moving equipment including crawler-type tractors before moving them from an infested area into a noninfested area.

When cleaning equipment, furnish the scraping tools, brooms, water when required, and the labor. Water generally will be required to clean crawler-type tractors.

Have the earth-moving equipment inspected by the Department of Agriculture Inspector in Charge before moving it from the infested area.

C. Notify the Department of Agriculture Inspector in Charge

Notify the Department of Agriculture Inspector in Charge in advance concerning the movement of infested articles or equipment in order to plan the work and prevent operation delays.

Obtain the name, address, and telephone number of the Department of Agriculture Inspector(s) in Charge of the project from:

Section 157—Survey Aids

157.1 General Description

This work includes constructing, maintaining, and removing (when specified by the Engineer) survey aids required at the locations shown on the Plans or modified Plans, or at locations designated by the Engineer. Survey aids may be required when line and distance control for excavation, embankment, and/or bridges require triangulation.

This work also includes disposing of survey aids, unless the Engineer directs to leave the aids in place.

TT-529A

157.1.03 Submittals

General Provisions 101 through 150.

157.2 Materials

Comply with the following survey aid requirements:

A. General

The materials used to construct these expendable items do not require pre-inspection or sampling and testing. Replace, repair, or strengthen defective, worn, deteriorated, corroded, or unsatisfactory materials according to Subsection 157.3.07, “Contractor Warranty and Maintenance.”

B. Timber and Piles

Timber and piles may be untreated; however all piles shall be peeled. Timber may be of any commercial grade and species.

For triangulation stations, ensure that the center pile for the instrument mounting has a minimum diameter of 1 ft (300 mm) at a distance of 4 ft (1.2 m) from the butt. The minimum diameter of other piles in the station shall be 10 in (250 mm).

Use piles for survey targets that conform to the requirements of the Specifications. The butt diameter for timber walkway piles shall be at least 8 in (200 mm). Use piles that will maintain safe walkways for the duration of the Project.

C. Plywood

Use marine-type plywood for survey targets that is 0.75 in (19 mm) thick. Paint the plywood with coats that meet the requirements of the Federal Specification noted:

Apply an undercoat to all surfaces and edges (TT-E543); second and third coats—apply to all surfaces and edges (TT-E 529A, color number 27875); fourth and fifth coats—apply to colored areas (TT-529A, color number 21105).

D. Sheet Metal Caps

Use galvanized sheet metal caps for pile heads, galvanized large-headed roofing nails to attach the caps, and galvanized cable to wrap the pile clusters.

E. Other Hardware for Connections

Use bolts, nuts, washers, etc. of any commercial grade. They do not need to be galvanized.

157.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

157.3 Construction Requirements

General Provisions 101 through 150.

157.3.01 Personnel

General Provisions 101 through 150.

157.3.02 Equipment

General Provisions 101 through 150.

157.3.03 Preparation

General Provisions 101 through 150.

157.3.04 Fabrication

General Provisions 101 through 150.

157.3.05 Construction

A. Location of Base Lines, Triangulation Stations, and Survey Targets

Possible locations of base lines, triangulation stations, and survey targets are shown on the Plans. Timber walkways are included as a bid item, but their locations may not be shown on the Plans. Actual and final locations of survey aids are based upon Contractors' own procedures and equipment methods.

The Contractor and the Engineer must agree on the most effective means to control the line and distance during construction. At the Preconstruction Conference, discuss with the Subcontractors the plan of operation for reaching this consensus.

After the conference, the Plans will be modified to show the locations of base lines and the number and locations of triangulation stations and survey targets. Timber walkway locations may not be shown on the modified Plans. After receiving the modified plans, make survey aids construction the first operation, including the installation of timber walkways if needed to provide access.

B. Location of Survey Points

After the Contractor constructs survey aids, the Engineer places instrument mountings and performs field checks and office calculations necessary to provide the location of the survey points.

Even though electronic data methods are used to calculate the point locations, the Engineer may not be able to designate survey point locations immediately. Time Charges will not be suspended during this period.

C. Clearing and Grubbing

The Engineer must be satisfied with the method and the location of all clearing and grubbing necessary for survey aid construction as a part of this work. Dispose of removed materials as directed by the Engineer.

D. Framing

Perform all framing and construct survey aids according to the Plan details, unless the Engineer permits alternate details.

E. Triangulation Stations

Drive pile clusters into the underlying firm material to provide instrument mountings. Ensure that these mountings are steady enough to use during wind and wave conditions.

F. Survey Targets

Drive the piling into the firm material to provide and maintain accuracy of the targets under weather and construction conditions specific to the Project area.

G. Timber Walkways

Drive piling deep enough to provide stability under weather and construction conditions specific to the Project area.

Walkways may be required to provide access to triangulation stations, to provide access to boats located at the edge of marsh or swamp areas at low water or low tide periods, or for other purposes as designated on the Plans or by the Engineer.

Alternate designs will be considered if they have equal strength, width, and safety.

H. Height Control

Regardless of elevations stated or implied on the Plans or in the Contract, the Engineer can determine how high to construct the survey aids.

Construct items above the extreme high-tide mark. The Engineer may require triangulation stations used initially for roadway item control to be built higher. These higher stations may be used in bridge control that may be in the initial or subsequent Contracts.

Constructing railing ladders and other vertical means of access are considered incidental to constructing survey aids.

157.3.06 Quality Acceptance

General Provisions 101 through 150.

157.3.07 Contractor Warranty and Maintenance

Maintain the survey aids as follows:

- A. Promptly replace, repair, or strengthen defective, unduly worn, corroded, deteriorated, or otherwise unsatisfactory material at the Engineer’s request. Such maintenance is incidental to survey aid construction.
- B. Maintain survey aids to the Engineer’s satisfaction to ensure that they are safe, have longevity, and perform accurately.
- C. If a survey aid will be used to control the work under another Contract:
 - 1. Do not remove that aid.
 - 2. Before moving off the Project or before relinquishing maintenance to another Contractor, perform the maintenance required to leave the aid in serviceable use for the future Work. The Engineer must approve of the maintenance. The additional maintenance is considered incidental to survey aid construction.

The subsequent Contractor’s maintenance period will conclude when the survey aids no longer are needed for the duration of the Contract. The subsequent Contractor shall maintain the survey aids to the Engineer’s satisfaction needed for Work, as provided in Subsection 105.05, “Cooperation by Contractor” as incidental to the work.

When the aids no longer are needed the Engineer will advise the responsible Contractor. The Contractor who used the aids last shall remove and dispose of the material to the Engineer’s satisfaction. Removal and disposal is incidental to the work.

157.4 Measurement

This work is measured for payment in the units shown in Subsection 157.5, “Payment,” for accepted triangulation stations, survey targets, and timber walkways. Walkway measurements are horizontal and along center lines.

No separate measurements for payment are made to maintain, remove, or dispose of survey aids or to provide material, labor, or equipment required of a subsequent Contractor who does not originally construct the aids. All costs incidental to the work shall be included in other Contract Items.

157.4.01 Limits

General Provisions 101 through 150.

157.5 Payment

This work is paid for at the Contract Price per unit of measurement, complete in place, and when maintained and removed as directed.

These payments are full compensation for costs, direct and indirect, of complying with the requirements of this Specification.

Payment will be made under:

Item No. 157	Triangulation station	Per each
Item No. 157	Survey target	Per each
Item No. 157	Timber walkway	Per linear foot (meter)

157.5.01 Adjustments

General Provisions 101 through 150.

Section 158—Training Program

158.1 General Description

The Contractor’s Equal Employment Opportunity Affirmative Action Program includes on-the-job training aimed at fully qualifying trainees in the trade or job classification involved.

The Proposal specifies the number of trainees to be trained under this Specification.

This training specification is in implementation of 23 USC 140(a). As a part of the Contractor’s Equal Employment Opportunity Affirmative Action Program, provide training as specified in this specification.

158.1.01 Definitions

General Provisions 101 through 150.

158.1.02 Related References

A. Standard Specifications

General Provisions 101 through 150.

B. Reference Documents

Georgia On-the-Job Training Program Manual

158.1.03 Submittals

Submit an acceptable training program to the Department for review and approval within 30 days after the Notice to Proceed is issued. Failure to submit an acceptable training program, as determined by the Engineer, will result in the withholding of all Contractor progress payments

Specify the starting time for training in each of the classifications.

158.2 Materials

General Provisions 101 through 150.

158.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

158.3 Construction Requirements

158.3.01 Personnel

A. Number of Trainees

If the Contract Work is subcontracted, determine how many trainees, if any, the Subcontractor shall train. However, retain the primary responsibility for meeting the training requirements of this Specification. Ensure that this Specification applies to the Subcontract.

Where feasible, have 25 percent of the apprentices or trainees in each occupation be in their first year of apprenticeship or training.

Distribute the number of trainees among the work classifications based on needs and the availability of trainees in each classification (within a reasonable area of recruitment).

B. Types of Trainees in Attendance

1. **Construction Crafts.** Provide training in the construction crafts. Training may also be provided for lower-level management positions if training is oriented toward construction applications such as office engineers, estimators, time-keepers, etc.
2. **Laborers.** Training may be provided in the laborer classification if the training is meaningful and if significance is proven and approved by the Division Office.
3. **Clerks and Secretaries.** Do not provide training for clerk-typists or secretarial-type positions.
4. **Minorities and Women.** Conduct systematic and direct recruitment through public and private sources likely to yield minority and women trainees. Recruit minorities and women within a reasonable area of recruitment. Demonstrate the steps taken to recruit minorities and women for training to comply with this Specification. This training commitment is not intended to nor will it be used to discriminate against any applicant for training, whether or not the applicant is a member of a minority group.

158.3.02 Equipment

General Provisions 101 through 150.

158.3.03 Preparation

Give each trainee a copy of the program that is followed during training. Provide each trainee with certification showing the type and length of training satisfactorily completed.

The State will approve or accept the training program before beginning work on the classification covered by the training program.

158.3.04 Fabrication

General Provisions 101 through 150.

158.3.05 Construction

An employee who completes a training course or is employed as a journeyman cannot receive training in that area of expertise. Satisfy this requirement by including questions in the employee application or by using other means to disclose the trainee's status. Keep records of the findings of each case.

Some off-site training is permissible provided the training is an integral part of an approved training program and does not comprise a significant part of the overall training.

158.3.06 Quality Acceptance

The selected training program approved by the Department and the Federal Highway Administration establishes the minimum length and type of training for each classification. The Department and the Federal Highway Administration will approve a program if it is calculated to meet Equal Employment Opportunity obligations and qualify the average trainee for journeyman status in a classification by the end of the training period.

Acceptable apprenticeship programs include:

Programs registered with U.S. Department of Labor

Programs registered with the Bureau of Apprenticeship and Training

Programs registered with a State apprenticeship agency recognized by the Bureau

Training programs approved but not necessarily sponsored by the U.S. Department of Labor, Manpower Administration, Bureau of Apprenticeship and Training if administered in a manner consistent with the Equal Employment obligations of Federal-Aid highway construction contracts

158.3.07 Contractor Warranty and Maintenance

Maintain and furnish periodic records (form FHWA 1409) that document performance under this Specification.

158.4 Measurement

Except as otherwise noted in Subsection 158.4.01, "Limits," the Contractor will be reimbursed 80 cents for every hour an employee is trained in an approved training program on this Contract. If the number of trainees exceeds the number specified in this Training Specification, reimbursement will be at the Engineer's approval. The Contractor will receive the reimbursement even though additional training program funds are received from other sources (only if the other sources do not specifically prohibit the Contractor from receiving other reimbursement).

The Contractor will be not receive any progress payment under any one of these conditions:

- Failure to provide an acceptable training program to the Department within 30 days after the Notice to Proceed is issued
- The Contractor fails to provide the required training
- The trainee fails to be hired as a journeyman at the fault of the Contractor
- The Contractor fails to show good faith to meet the requirements of this Training Specification

158.4.01 Limits

The Contractor is credited for each trainee that is employed on the Contract Work and that is currently enrolled or becomes enrolled in an approved program. Reimbursement for such trainees is as follows:

1. The Contractor receives reimbursement for off-site training only if trainees are concurrently employed on a Federal-aid project and the Contractor does one or more of the following:
 - Contributes to the cost of the training
 - Provides instruction to the trainee or pays the trainee's wages during the off-site training
2. The Contractor provides acceptable training to the number of trainees specified on the Contract.
3. A trainee begins training on the project as soon as feasible after the work that uses the trained skill has begun.
4. The trainee remains on the project as long as training opportunities exist in the work classification or until the trainee has completed the training program. Trainees do not need to be employed for the entire length of the Contract.
5. Trainees are paid at least 60 percent of the appropriate minimum journeyman's rate specified on the Contract for the first half of the training period, 75 percent for the third quarter of the training period, and 90 percent for the last quarter of the training period.

If apprentices or trainees in an approved existing program are enrolled as trainees in the same classification on this Project, the appropriate rates approved by the Departments of Labor or Transportation for the existing program shall apply to the trainees.

158.5 Payment

Payment will be made under:

Item No. 158	Training hours	\$0.80 per hour
--------------	----------------	-----------------

158.5.01 Adjustments

General Provisions 101 through 150.

Section 160—Reclamation of Material Pits and Waste Areas

160.1 General Description

This work includes reclaiming material pits and waste areas by vegetative planting and applies to areas outside of the right-of-way.

The vegetative requirements of this section apply when the Contractor obtains material from a source or wastes material on an area other than within the Right of Way. These requirements apply regardless of how the source or area is obtained.

Exceptions to the vegetative requirements of this section include:

- A material source where the Engineer determines not to drain water that accumulates after the material is removed. Only the slopes above water will be planted.
- An area composed of rock or other materials that the Engineer determines are not satisfactory for permanent vegetative cover.
- An area that has been exempted in writing by the Georgia Surface Mined Land Use Board.
- An area where the owner or Contractor, (whichever is designated as the Operator) secures a license from the Surface Mined Land Use Board for surface mining. The Operator will be responsible only to the Surface Mined Land Use Board for reclamation of the affected area.

Section 702—Vine, Shrub and Tree Planting

Section 890—Seed and Sod

B. Referenced Documents

General Provisions 101 through 150.

160.1.03 Submittals

The Engineer must:

- Approve the planting type if the Contractor furnishes a material pit or waste area that requires vegetation under the provisions of this Specification.
- Approve all modified mixtures before planting begins.

The property owner may change the plant material types specified in the Plans to a type not shown in the Planting Table in Subsection 160.2, “Planting Table”, below. If a change is made, the mixture shall cost approximately the same and shall produce an equal amount of protective covering as the mixture contained in this Specification.

160.2 Materials

Materials shall conform to the requirements of Sections 700 and 702 as applicable.

If the Plans or the Proposal do not specify the vegetation type to be planted on State-optioned areas, the Engineer will select the type to be used on each area from the Planting Table.

The State is divided into planting zones as shown on the Planting Zones Map in Sections 700. Consult the Planting Table when planting and follow these points:

- Do not use giant bermuda seed (cynodon species) including NK-37.

Section 160-Reclamation of Material Pits and Waste Areas

- Do not use Italian rye grass seed—perennial or annual.
- Apply the entire combination of seeds specified for each group in the amounts specified. If the property owner does not make a specific choice, use planting groups A, B, C, G, H, or N-1.
- Increase all seed quantities 50 percent on slopes that are too steep for soil preparation and cannot be dug at least 6 in (150 mm) deep.
- Air dry sericea lespedeza seed hay and ensure that it contains mature seed.

160.2.01 Delivery, Storage, and Handling

If the sprigs are stockpiled, cover the sprigs and keep them moist.

160.3 Construction Requirements

160.3.01 Personnel

General Provisions 101 through 150.

160.3.02 Equipment

Equipment shall conform to the requirements of Section 700 and Section 702 as applicable.

160.3.03 Preparation

Seed or sprig areas that are subject to erosion. If the Engineer feels the borrow pit or waste area will be subject to erosion, grass and mulch areas that require pine seedlings before planting the seedlings.

160.3.04 Fabrication

General Provisions 101 through 150.

160.3.05 Construction

Comply with the construction methods in Section 700 for this work with the following exceptions:

A. Prepare the Ground

1. Complete the excavation.
2. Have the Engineer examine the slopes to ensure that planting is not done on areas composed of rock or other materials that the Engineer determines unsatisfactory for permanent vegetation.
3. Plow areas that are to be planted to a depth of 6 in (150 mm) unless the areas are exempted in this Specification or in Section 700.

B. Apply Lime and Fertilizer

1. Spread agricultural lime uniformly at the rate shown on the Plans or determined by the Engineer.
2. Apply fertilizer grade 4-12-12, 6-12-12, or 5-10-15 uniformly at approximately 1,200 lbs/acre (1350 kg/ha).
3. Mix the lime and fertilizer into the top 2 in (50 mm) of soil, including the areas to be planted with pine seedlings.
4. Hydroseed slopes steeper than 2 to 1 as defined in Subsection 700.3.05.F, "Hydroseeding." The mixing may be eliminated.

C. Seed

Sow seeds at the rates specified in the Subsection 160.2, "Planting Table".

D. Mulch

1. Use any mulch type listed in Subsection 700.3.05.G, "Mulching."
2. Mulch all seeded and sprigged areas.

E. Plant Pine Seedlings

1. Use a dibble or other approved planter to dig holes for the pine seedlings after seeding or sprigging and mulching.
2. Set the plants slightly deeper than they were planted in the nursery. When hand planting, compact the bottom of the hole before setting the plants.

F. Apply Nitrogen

1. Apply nitrogen according to Subsection 700.3.05.I, "Application of Nitrogen."
2. Do not apply nitrogen directly over the seedlings.

G. Harvest Sprigs

1. Observe sprigging seasonal limitations. See Subsection 160.2, "Planting Table".
2. Inspect harvesting sites. Ensure inspection is according to Subsection 890.2.02.C, "Acceptance."
3. Harvest sprigs as follows:
 - a. Harvest the sprigs using a sod cutter, turning plow, or other approved equipment so that at least 3 in (75 mm) of the root system is lifted intact.
 - b. Immediately load the harvested sprigs and cover them with wet burlap or canvas to prevent weather damage.
 - c. Transport the sprigs to where they will be immediately planted or stockpiled.
 - d. Plant sprigs within 48 hours after they are harvested. Never allow sprigs to dry out or freeze.

H. Apply Sprigs

Apply sprigs using either the broadcast or row method. However, do not perform broadcast sprigging on steep slopes or narrow areas where results will not be satisfactory.

During sprigging, ensure that the soil moisture content is at least the optimum for soil sprigging.

1. Broadcast Sprigging

Perform broadcast sprigging as follows:

- a. Apply the sprigs mechanically or by hand in a uniform layer over the prepared surface placing at least 4 viable sprigs to each square foot (43 viable sprigs to each square meter).
- b. Place the sprigs 2 to 3 in (50 to 75 mm) deep by disc harrowing or by other satisfactory means.

2. Row Sprigging

Perform row sprigging as follows:

- a. Open furrows spaced at least 1 ft (300 mm) apart to at least 4 in (100 mm) deep.
- b. Immediately place the sprigs in the furrows by hand or by planting machines and overlap them in the furrows.
- c. Do not expose sprigs more than 15 minutes before filling in the furrows.

I. Restore Line and Grade, and Roll

After the sprigging is done, do the following:

1. Return the impaired sections back to the line and grade as established by the Engineer.
2. Roll the area at right angles to the direction of the slope incline.

J. Mulch Sprigged Areas

Mulch sprigged areas within the construction limits according to Subsection 700.3.05.G, "Mulching."

1. Mulch with Binder

When applying mulch with binder, apply immediately after the overseeding and rolling are complete.

2. Mixed-in-Place Mulch

When applying mixed-in-place mulch, apply immediately after sprigging.

160.3.06 Quality Acceptance

Before Final Acceptance, each planted area shall meet the requirements for satisfactory growth and development as defined in Subsection 160.5.01.A, "Plant Establishment." Except as otherwise specified in this Specification, all seeding shall conform to Section 700, and pine seedling planting shall conform to Section 702.

160.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

160.4 Measurement

The following will be measured in acres (hectares) horizontal measurement:

- Area reclamation—seeding or sprigging
- Area reclamation—pine seedlings including fertilizer and mulch

Reclamation items that are completed, accepted, and eligible for measurement and payment are subject to the following conditions:

- Each work item shall be done for the Department according to the Specifications and terms of the Contract.
- Areas where the work is done shall be shown on the Plans as possible sources of materials or waste areas.
- If the Contractor furnishes a substitute area, measurement of reclamation terms eligible for payment shall not exceed Plan quantities.

160.4.01 Limits

Some reclamation items are not eligible for measurement and payment by the Department. These include but are not limited to:

Items performed for or paid for by another agency

Section 160-Reclamation of Material Pits and Waste Areas

Items performed on areas, other than substitute areas, secured by the Contractor but not shown on the Plans
Items performed on any area excluded under Subsection 160.1, “General Description.”

160.5 Payment

Items of area reclamation will be paid for if complete in place and accepted.

The following will be paid for at the Contract Unit Price per acre (hectare):

- Area reclamation—seeding or sprigging
- Area reclamation—pine seedlings measured for payment

Payment shall be full compensation for:

- Preparing the ground
- Seeding or planting
- Applying fertilizer, including nitrogen
- Watering
- Mulching
- Providing other work and incidentals necessary to complete the Item except lime, which will be measured and paid for according to Section 700.

The Contractor will be allowed full measurement and payment on his regular monthly estimates for all reclamation items at the time they are first completed, provided the work has been done in strict compliance with the Specifications.

Payment will be made under:

Item No. 160	Area reclamation, seeding	Per acre (hectare)
Item No. 160	Area reclamation, sprigging	Per acre (hectare)
Item No. 160	Area reclamation, pine seedlings	Per acre (hectare)
Item No. 700	Agricultural lime	Per ton (megagram)

160.5.01 Adjustments

A. Plant Establishment

Perform plant establishment according to Subsection 700.3.07.A, “Plant Establishment” except that mowing is not required.

B. Pine Tree Seedlings

The area covered with pine tree seedlings will not be considered satisfactory until 85 percent or more of the growth has survived 90 days after planting with no fail spots exceeding 0.25 acre (0.1 ha).

If the survival rate is less than 85 percent, but greater than 75 percent, and fail spots do not exceed 0.25 acre (0.1 ha), the affected area will be measured for payment at half the Contract price unless the Contractor replants the deficient area to meet the requirements for full growth and coverage.

Areas that do not meet the minimum 75 percent requirement shall be replanted in full at the Contractor’s expense. All replanting shall be done within the allowable planting season for pine seedlings as shown in Subsection 160.2, “Planting Table”.

Section 161—Control of Soil Erosion and Sedimentation

161.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 162—Erosion Control Check Dams

162.1 General Description

This work includes furnishing, constructing, and maintaining erosion control check dams.

162.1.01 Definitions

General Provisions 101 through 150.

162.1.02 Related References

A. Standard Specifications

Section 810—Roadway Materials

B. Referenced Documents

General Provisions 101 through 150.

162.1.03 Submittals

General Provisions 101 through 150.

162.2 Materials

A. Erosion Control Materials

Use these materials as needed to control erosion on check dams:

1. Where required, use any commercial type of woven wire minimum 14 ½ gauge.
2. Obtain other materials such as logs, brush, stakes, etc., from the Right-of-Way where available.
3. Place Number 57 stone, where required, at the location and depth indicated on the Plans.
4. Ensure that material in the earth dams meets the requirements of Subsection 810.2.01.A.1, “Classes” for Class II soils.

162.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

162.3 Construction Requirements

162.3.01 Personnel

General Provisions 101 through 150.

162.3.02 Equipment

General Provisions 101 through 150.

162.3.03 Preparation

General Provisions 101 through 150.

162.3.04 Fabrication

General Provisions 101 through 150.

162.3.05 Construction

A. Check Dam Construction

Construct check dams as follows:

1. Construct check dams before roadway clearing, grubbing, or grading is done in the affected drainage area. Construct according to the Plans.
2. Remove the trees, logs, brush, etc., within the Right-of-Way and the affected area that may be used to construct the check dams. Do not disturb other natural ground cover.

NOTE: Use only rubber-tired equipment to work in the affected drainage area until after the check dam is in place and completed.

3. Obtain the embankment material for the earth dams from outside the area draining into the protected pond or stream.
4. Immediately after completing the earthwork on the earth dams, place a layer of Number 57 stone on the downstream side of the dam. Immediately grass the remaining portions (top and upstream slopes) of the earth dams.
5. Immediately after grading, grass or stabilize with straw mulch roadway cut and fill slopes that drain toward the check dam drainage area.
6. Leave check dams in place after construction is complete unless otherwise directed by the Engineer.

162.3.06 Quality Acceptance

General Provisions 101 through 150.

162.3.07 Contractor Warranty and Maintenance

Repair the check dams as needed during the life of the Contract.

The estimated number of check dams required is shown on the Plans. Additional check dams may be necessary and shall be constructed when directed by the Engineer.

162.4 Measurement

The number of erosion control check dams measured for the payment is the actual number completed and accepted.

162.4.01 Limits

General Provisions 101 through 150.

162.5 Payment

Erosion control check dams, as measured in Subsection 162.4, "Measurement," are paid for at the Contract Unit Price. Payment is full compensation for:

- Earth dam construction and compaction
- Required grassing, mulching, and Number 57 stone
- Log dams and dissipaters
- Removal if ordered by the Engineer

Payment for this Item is made as follows:

- 75 percent of the Contract Price is paid when each erosion control check dam is complete in place.
- 25 percent is paid when the Engineer instructs the Contractor that the check dam is no longer required but will remain in place or be removed, whichever applies.

NOTE: Temporary devices will be left in place at the Engineer’s discretion without a change in cost.

Payment will be made under:

Item No. 162	Erosion control check dam—type__	Per each
--------------	----------------------------------	----------

162.5.01 Adjustments

General Provisions 101 through 150.

Section 163—Miscellaneous Erosion Control Items

163.1 General Description

This work includes constructing and removing:

- Silt control gates
- Temporary erosion control slope drains shown on the Plans or as directed
- Sediment basins
- Baled straw sediment barrier and check dams
- Rock filter dams
- Stone filter berms
- Stone filter rings
- Other temporary erosion control structures shown on the Plans or directed by the Engineer

This work also includes applying mulch (straw or hay, erosion control compost), and temporary grass.

B. Referenced Documents

- AASHTO M252
- AASHTO M294

163.1.02 Submittals

Provide written documentation to the Engineer as to the average weight of the bales of mulch.

163.2 Materials

Provide materials shown on the Plans, such as pipe, spillways, wood baffles, and other accessories including an anti-seep collar, when necessary. The materials shall remain the Contractor’s property after removal, unless otherwise shown on the Plans.

Materials may be new or used; however, the Engineer shall approve previously used materials before use.

Materials shall meet the requirements of the following Specifications:

Material	Section
Mulch	<u>893.2.02</u>
Temporary Silt Fence	<u>171</u>
Concrete Aprons and Footings shall be Class A	<u>500</u>
Rip Rap	<u>603</u>
Temporary Grass	<u>700</u>
Bituminous Treated Roving	<u>715</u>
Triangular Silt Barrier	<u>720</u>
Lumber and Timber	<u>860.2.01</u>
Preservative Treatment of Timber Products	<u>863.1</u>
Corrugated Polyethylene Temporary Slope Drain Pipe	AASHTO M252 or M294

163.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

163.3 Construction Requirements

163.3.01 Personnel

General Provisions 101 through 150.

163.3.02 Equipment

General Provisions 101 through 150.

163.3.03 Preparation

General Provisions 101 through 150.

163.3.04 Fabrication

General Provisions 101 through 150.

163.3.05 Construction

A. Silt Control Gates

If silt control gates are required or are directed by the Engineer, follow these guidelines to construct them:

1. Clear and grade only that portion of the roadway within the affected drainage area where the drainage structure will be constructed.
2. Construct or install the drainage structure and backfill as required for stability.
3. Install the silt control gate at the inlet of the structure. Use the type indicated on the Plans.
4. Vary the height of the gate as required or as shown on the Plans.
5. Finish grading the roadway in the affected drainage area. Grass and mulch slopes and ditches that will not be paved. Construct the ditch paving required in the affected area.
6. Keep the gate in place until the work in the affected drainage area is complete and the erodible area is stabilized.
7. Remove the Type 1 silt gate assembly by sawing off the wood posts flush with the concrete apron. Leave the concrete apron between the gate and the structure inlet in place. The gate shall remain the property of the Contractor.

B. Temporary Slope Drains

If temporary slope drains are required, conduct the roadway grading operation according to [Section 161](#) and follow these guidelines:

1. Place temporary pipe slope drains with inlets and velocity dissipaters (straw bales, silt fence, or aprons) according to the Plans.
2. Securely anchor the inlet into the slope to provide a watertight connection to the earth berm. Ensure that all connections in the pipe are leak proof.
3. Place temporary slope drains at a spacing of 350 ft (105 m) maximum on a 0% to 2% grade and at a spacing of 200 ft (60m) maximum on steeper grades, or more frequently as directed by the Engineer. Keep the slope drains in place until the permanent grass has grown enough to control erosion.
4. Remove the slope drains and grass the disturbed area with permanent grass. However, the temporary slope drains may remain in place to help establish permanent grass if approved by the Engineer.

C. Sediment Basins

Construct sediment basins according to the Plans at the required location, or as modified by the Engineer.

1. Construct the unit complete as shown, including:
 - Grading
 - Drainage
 - Rip rap
 - Spillways
 - Anti-seep collar
 - Temporary mulching and grassing on internal and external slopes
 - Accessories to complete the basin
2. When the sediment basin is no longer needed, remove and dispose of the remaining sediment.
3. Remove the sediment basin. Grade to drain and restore the area to blend with the adjacent landscape.
4. Mulch and permanently grass the disturbed areas according to [Section 700](#).

D. Sediment Barrier (baled straw)

Construct sediment barrier (baled straw) according to the Plan details. Use rectangular, standard size baled straw in mechanically produced bales.

The following items may be substituted for sediment barrier (baled straw)

1. Type B Silt Fence.
2. Triangular Silt Barrier.

3. Synthetic Fiber: Use synthetic fiber bales of circular cross section at least 18 in (450 mm) in diameter. Use synthetic bales of 3 ft or 6 ft (0.9 m or 1.8 m) in length that are capable of being linked together to form a continuous roll of the desired total length. Use bales that are enclosed in a geotextile fabric and that contain a pre-made stake hole for anchoring.
4. Coir: Use coir fiber bales of circular cross section at least 16" (400mm) in diameter. Use coir bales of 10 ft, 15 ft, or 20 ft (3 m, 4.5 m, or 6 m) in length. Use coir baled with coir twine netting with 2 in X 2 in (50 mm X 50 mm) openings. Use coir bales with a dry density of at least 7 lb/ft³ (112 kg/m³). Anchor in place with 2 in X 4 in (50 mm X 100 mm) wooden wedges with a 6 in (150 mm) nail at the top. Place wedges no more than 36 in (900 mm) apart.
5. Excelsior: Use curled aspen excelsior fiber with barbed edges in circular bales of at least 18 in (450 mm) in diameter and nominally 10 ft (3 m) in length. Use excelsior baled with polyester netting with 1 in X 1 in (25 mm by 25 mm) triangular openings. Use excelsior bales with a dry density of at least 1.4 lb/ft³ (22 kg/m³). Anchor in place with 1 in (25 mm) diameter wooden stakes driven through the netting at intervals of no more than 2 ft (600 mm).
6. Compost Filter Sock: Use general use compost (see Subsection 893.2.02.A.5.b) in circular bales at least 18 in diameter. Use compost baled with photo-degradable plastic mesh 3 mils thick with a maximum 0.25 in X 0.25 in (6 mm X 6 mm) openings. Anchor in place with 1 in (25 mm) diameter wooden stakes driven through the netting at intervals of no more than 2 ft (600 mm). The sock shall be dispersed on site when no longer required, as determined by the Engineer. Do not use Compost Filter Socks in areas where the use of fertilizer is restricted.
7. Compost Filter Berm: Use erosion control compost (see [Subsection 893.2.02](#)) to construct an uncompacted 1.5 ft to 2 ft (450 mm to 600 mm) high trapezoidal berm which is approximately 2 ft to 3 ft (600 mm to 1 m) wide at the top and minimum 4 ft (1.2 m) wide at the base. Do not use Compost Filter Berms in areas where the use of fertilizer is restricted.

The construction of the compost filter berm includes the following:

- a. Keeping the berm in a functional condition.
- b. Installing additional berm material when necessary.
- c. Removing the berm when no longer required, as determined by the Engineer. At the Engineer's discretion, berm material may be left to decompose naturally, or distributed over the adjacent area.

E. Other Temporary Structures

When special conditions occur during the design stage, the Plans may show other temporary structures for erosion control with required materials and construction methods.

F. Temporary Grass

Use a quick growing species of temporary grass such as rye grass, millet, or a cereal grass suitable to the area and season.

Use temporary grass in the following situations:

- When required by the Specifications or directed by the Engineer to control erosion where permanent grassing cannot be planted.
- To protect an area for longer than mulch is expected to last (60 calendar days).

Plant temporary grass as follows:

1. Use seeds that conform to Subsection 890.2.01, "Seed." Perform seeding according to [Section 700](#); except use the minimum ground preparation necessary to provide a seed bed if further grading is required.
2. Prepare areas that require no further grading according to Subsection 700.3.05.A, "Ground Preparation." Omit the lime unless the area will be planted with permanent grass without further grading. In this case, apply the lime according to [Section 700](#).
3. Apply mixed grade fertilizer at 400 lbs/acre (450 kg/ha). Omit the nitrogen. Mulch (with straw or hay) temporary grass according to [Section 700](#). (Erosion control compost Mulch will not be allowed with grassing.)
4. Before planting permanent grass, thoroughly plow and prepare areas where temporary grass has been planted according to Subsection 700.3.05.A, "Ground Preparation".
5. Apply Polyacrylamide (PAM) to all areas that receive temporary grassing.

6. Apply Pam (powder) before grassing or PAM (emulsion) to the hydroseeding operation.
7. Apply PAM according to manufacturer specifications.
8. Use only anionic PAM.

For projects that consist of shoulder reconstruction and/or shoulder widening, refer to Section 161.3.05H for Wood Fiber Blanket requirements.

G. Mulch

When stage construction or other conditions prevent completing a roadway section continuously, apply mulch (straw or hay or erosion control compost) to control erosion. Mulch may be used without temporary grassing for 60 calendar days or less. Areas stabilized with only mulch (straw/hay) shall be planted with temporary grass after 60 calendar days.

Apply mulch as follows:

1. Mulch (Hay or Straw) - Without Grass Seed
 - a. Uniformly spread the mulch over the designated areas from 2 in to 4 in (50 mm to 100 mm) thick.
 - b. After spreading the mulch, walk in the mulch by using a tracked vehicle (preferred method), empty sheep foot roller, light disking, or other means that preserves the finished cross section of the prepared areas. The Engineer will approve of the method.
 - c. Place temporary mulch on slopes as steep as 2:1 by using a tracked vehicle to imbed the mulch into the slope.
 - d. When grassing operations begin, leave the mulch in place and plow the mulch into the soil during seed bed preparation. The mulch will become beneficial plant food for the newly planted grass.
2. Erosion control compost - Without Grass Seed
 - a. Uniformly spread the mulch (erosion control compost) over the designated areas 2 in (50 mm) thick.
 - b. When rolling is necessary, or directed by the Engineer, use a light corrugated drum roller.
 - c. When grassing operations begin, leave the mulch in place and plow the mulch into the soil during seed bed preparation. The mulch will become beneficial plant food for the newly planted grass.
 - d. Plant temporary grass on area stabilized with mulch (erosion control compost) after 60 calendar days.
 - e. Do not use Erosion Control Compost in areas where the use of fertilizer is restricted.

H. Miscellaneous Erosion Control Not Shown on the Plans

When conditions develop during construction that were unforeseen in the design stage, the Engineer may direct the Contractor to construct temporary devices such as but not limited to:

- Bulkheads
- Sump holes
- Half round pipe for use as ditch liners
- U-V resistant plastic sheets to cover critical cut slopes

The Engineer and the Contractor will determine the placement to ensure erosion control in the affected area.

I. Diversion Channels

When constructing a culvert or other drainage structure in a live stream that requires diverting a stream, construct a diversion channel.

J. Temporary Check Dams

Temporary check dams are constructed of the following materials;

- Stone plain rip rap according to [Section 603](#) or of sand bags as in [Section 603](#) without Portland cement. (Place plastic filter fabric on ditch section before placing rip rap.)
- Fabric (Type C silt fence)

- Hay Bales

Temporary check dams shall be constructed according to plan details and shall remain in place until the permanent ditch protection is in place or being installed and the removal is approved by the Engineer.

K. Construction Exits

Locate construction exits at any point where vehicles will be leaving the project onto a public roadway. Install construction exits at the locations shown in the plans and in accordance with plan details.

L. Retrofit

Add the retrofit device to the permanent outlet structure as shown on the Plan details.

When all land disturbing activities that would contribute sediment-laden runoff to the basin are complete, clean the basin of sediment and stabilize the basin area with vegetation.

When the basin is stabilized, remove the retrofit device from the permanent outlet structure of the detention pond.

M. Inlet Sediment Trap

Inlet sediment traps consist of a temporary device placed around a storm drain inlet to trap sediment. An excavated area adjacent to the sediment trap will provide additional sediment storage.

Inlet sediment traps may be constructed of Type C silt fence, plastic frame and filter, hay bales, baffle box, or other filtering materials approved by the Engineer.

Construct inlet sediment traps according to the appropriate specification for the material selected for the trap.

Place inlet sediment traps as shown on the Plans or as directed by the Engineer.

N. Rock Filter Dams

Construct rock filter dams of the material selected as shown in the approved erosion and sediment control plan. Construct and place this item in accordance with the approved erosion control construction detail(s) and Standard Specification [Section 603](#).

Rock filter dams shall remain in place until the permanent ditch protection is in place or is being installed and their removal is approved by the Engineer.

O. Stone Filter Berms

Construct stone filter berms of the material selected as shown in the approved erosion and sediment control plan. Construct and place this item in accordance with the approved erosion control construction detail(s) and Standard Specification [Section 603](#).

Stone filter berms shall remain in place until the permanent slope protection is in place or is being installed and their removal is approved by the Engineer.

P. Stone Filter Rings

Construct stone filter rings of the material selected as shown in the approved erosion and sediment control plan. Construct and place this item in accordance with the approved erosion control construction detail(s) and Standard Specification [Section 603](#).

A stone filter ring shall remain in place until final stabilization of the area which drains toward it is achieved and its removal is approved by the Engineer.

163.3.06 Quality Acceptance

General Provisions 101 through 150.

163.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

163.4 Measurement

A. Silt Control Gates

Silt control gates are measured for payment by the entire structure constructed at each location complete in place and accepted. Silt control gates constructed at the inlet of multiple lines of drainage structures are measured for payment as a single unit.

B. Temporary Slope Drains

Temporary slope drains are measured for payment by the linear foot (meter) of pipe placed. When required, the inlet spillway and outlet apron and/or other dissipation devices are incidental and not measured separately.

C. Sediment Basins

Sediment basins are measured for payment by the entire structure complete, including construction, maintenance, and removal. Measurement also includes:

- Earthwork
- Drainage
- Spillways
- Baffles
- Rip rap
- Final cleaning to remove the basin

Permanent and temporary grassing for sediment basins is measured separately for payment.

D. Diversion Channels

Diversion channels are not measured for payment. Costs for the entire structure complete, including materials, construction (including earthwork), and removal is included in the price bid for the drainage structure or for other Contract items.

E. Temporary Grass

Temporary grass is measured for payment by the acre (hectare). Lime, when required, is measured by the ton (megagram). Mulch and fertilizer are measured separately for payment.

F. Mulch

Mulch (straw or hay, or erosion control compost) is measured for payment by the ton (megagram).

G. Baled Straw Sediment Barrier, Baled Straw Check Dam and Fabric Check Dams

Baled straw sediment barrier, baled straw check dams, and fabric check dams are measured by the linear foot (meter). When the Contractor substitutes a product allowed in [Subsection 163.3.05.D](#) for baled straw sediment barrier or when the Engineer directs this substitution, the product will be measured by the linear foot (meter).

H. Rip Rap Check Dams

Rip Rap Check Dams are measured per each which will include all work necessary to construct the check dam including plastic filter fabric placed beneath the rip rap or sand bags.

I. Construction Exits

Construction exits are measured per each which will include all work necessary to construct the exit including the required geotextile fabric placed beneath the aggregate.

J. Retrofit

Retrofit will be measured for payment per each. The construction of the detention pond and permanent outlet structure will be measured separately under the appropriate items.

K. Inlet Sediment Trap

Inlet sediment traps, regardless of the material selected, are measured per each which includes all work necessary to construct the trap including any incidentals and providing the excavated area for sediment storage.

L. Rock Filter Dams

Rock filter dams are measured for payment per each required. This includes the entire structure at each location and all the work necessary for construction.

M. Stone Filter Berms

Stone filter berms are measured for payment per each required. This includes the entire structure at each location and all the work necessary for construction.

N. Stone Filter Rings

Stone filter rings are measured for payment per each required. This includes the entire structure at each location and all the work necessary for construction.

163.4.01 Limits

General Provisions 101 through 150.

163.5 Payment

A. Silt Control Gates

The specified silt control gates are paid for at the Contract Unit Price per each. Payment is full compensation for:

- Furnishing the material and labor
- Constructing the concrete apron as shown on the Plans
- Excavating and backfilling to place the apron
- Removing the gate

B. Temporary Slope Drains

Temporary slope drains are paid for by the linear foot (meter). Payment is full compensation for materials, construction, removal (if required), inlet spillways, velocity dissipaters, and outlet aprons.

When temporary drain inlets and pipe slope drains are removed, they remain the Contractor's property and may be reused or removed from the Project as the Contractor desires. Reused pipe or inlets are paid for the same as new pipe or inlets.

C. Sediment Basin

Sediment basins, measured according to [Subsection 163.4.C “Measurement.”](#) are paid for by the unit, per each, for the type specified on the Plans. Price and payment are full compensation for work and supervision to construct, and remove the sediment basin, including final clean-up.

D. Diversion Channel

Diversion channels are not paid for separately; they are included in the price bid for the drainage structure or for other Contract Items.

E. Temporary Grass

Temporary grass is paid for by the acre (hectare). Payment is full compensation for all equipment, labor, ground preparation, materials, wood fiber mulch, polyacrylamide, and other incidentals. Lime (when required) is paid for by the ton (megagram). Mulch and fertilizer are paid for separately.

F. Mulch

Mulch is paid for by the ton. Payment is full compensation for all materials, labor, maintenance, equipment and other incidentals.

The weight for payment of straw or hay mulch will be the product of the number of bales used and the average weight per bale as determined on certified scales provided by the contractor or state certified scales. Provide written documentation to the Engineer stating the average weight of the bales.

The weight of erosion control compost mulch will be determined by weighing each loaded vehicle on the required motor truck scale as the material is hauled to the roadway, or by using recorded weights if a digital recording device is used. The contractor may propose other methods of providing the weight of the mulch to Engineer for approval.

G. Baled Straw Sediment barrier, Baled Straw Check Dams and Fabric Check Dams (Type C Silt Fence)

Baled straw sediment barrier, baled straw check dams and fabric check dams (type C silt fence), complete in place and accepted are paid for at the Contract Unit Price bid per linear foot (meter). Payment is full compensation for constructing, and removing (when directed) the baled straw sediment barrier or either check dam.

When the Contractor substitutes any product allowed in [Subsection 163.3.05.D](#) for baled straw sediment barrier or when the Engineer directs this substitution, payment is made at the bid price per linear foot (meter) for baled straw sediment barrier.

H. Rip Rap Check Dams

Rip Rap Check Dams are paid for per each. Payment is full compensation for all materials, construction, and removal. Reused stone plain rip rap or sandbags are paid for on the same basis as new items. Filter fabric required under rip rap check dams is included in the price bid for each check dam.

I. Construction Exits

Construction exits are paid for per each. Payment is full compensation for all materials including the required geotextile, construction, and removal.

J. Retrofit

This item is paid for at the Contract Unit Price per each. Payment is full compensation for all work, supervision, materials (including the stone filter), labor and equipment necessary to construct and remove the retrofit device from an existing or proposed detention pond outlet structure.

K. Inlet Sediment Trap

Inlet sediment traps are paid for per each. Payment is full compensation for all materials, construction, and removal

L. Rock Filter Dams

Rock filter dams are paid for per each. Payment is full compensation for all materials, construction, and removal for each. Clean reused stone Type 3 riprap and #57 stone are paid for on the same basis as new items. Plastic woven filter fabric is required under rock filter dams and is included in the price bid for each.

M. Stone Filter Berms

Stone filter berms are paid for per each. Payment is full compensation for all materials, construction, and removal for each. Clean reused stone Type 3 riprap and #57 stone are paid for on the same basis as new items. Plastic woven filter fabric is required under rock filter berms and is included in the price bid for each.

N. Stone Filter Rings

Stone filter rings are paid for per each. Payment is full compensation for all materials, construction, and removal for each. Clean reused stone Type 3 riprap and #57 stone are paid for on the same basis as new items. Plastic woven filter fabric is required under stone filter rings and is included in the price bid for each.

The Items in this Section (except temporary grass and mulch) are made as partial payments as follows:

- When the item is installed and put into operation the Contractor will be paid 75 percent of the Contract price.
- When the Engineer instructs the Contractor that the Item is no longer required and is to remain in place or is removed, whichever applies, the remaining 25 percent will be paid.

Temporary devices may be left in place at the Engineer’s discretion at no change in cost. Payment for temporary grass will be made based on the number of acres (hectares) grassed. Mulch will be based on the number of tons (megagrams) used.

Payment is made under:

Item No. 163	Construct and remove silt control gate, type__	Per each
Item No. 163	Construct and remove temporary pipe slope drains	Per linear foot (meter)
Item No. 163	Construct and remove temporary sediment barrier or baled straw check dam	Per linear foot (meter)
Item No. 163	Construct and remove sediment basin type__, Sta. No.____	Per each
Item No. 163	Construct and remove Fabric Check Dam - type C silt fence	Per linear foot (meter)
Item No. 163	Construct and remove Rip Rap Check Dams ,Stone Plain Rip Rap/Sand Bags	Per Each
Item No. 163	Construction exit	Per each
Item No. 163	Construct and remove retrofit, Sta. No.____	Per each
Item No. 163	Construct and remove rock filter dam	Per each
Item No. 163	Construct and remove stone filter berm	Per linear foot (meter)
Item No. 163	Construct and remove stone filter ring	Per each
Item No. 163	Construct and remove inlet sediment trap	Per each
Item No. 163	Temporary grass	Per acre (hectare)
Item No. 163	Mulch	Per ton (megagram)

163.5.01 Adjustments

General Provisions 101 through 150.

Section 165—Maintenance of Temporary Erosion and Sedimentation Control Devices

165.1 General Description

This work consists of providing maintenance on temporary erosion and sediment control devices, including but not limited to the following:

- Silt fence
- Sediment basins
- Silt control gates
- Check dams
- Silt retention barriers
- Rock filter dams
- Stone filter berms
- Stone filter rings

It also consists of removing sediment that has accumulated at the temporary erosion and sediment control devices.

165.3.03 Preparation

General Provisions 101 through 150.

165.3.04 Fabrication

General Provisions 101 through 150.

165.3.05 Construction

A. General

As a minimum, clean the sediment from all temporary erosion control devices (except sediment basins) installed on the project when one half the capacity, by height, depth or volume has been reached. Clean the sediment from all temporary sediment basins installed on a project when one third the capacity of the storage volume has been filled.

Handle sediment excavated from any erosion or sediment control device in one of the following ways:

- Remove sediment from the immediate area and immediately stabilize it to prevent the material from refilling any erosion or sediment control device.
- Place and mix it in the roadway embankment, or waste it in an area approved by the Engineer.
- Repair or replace at no cost to the Department, any erosion or sediment control devices that are not functioning properly or are damaged due to negligence or abuse.

B. Temporary Silt Fence

Maintenance of Temporary Silt Fence consists of furnishing all labor, tools, materials, equipment and necessary incidentals to remove and dispose of accumulated sediment down to the original ground line (0 % filled). Also included is the removal of sediment accumulations (“filtercake”) on the fabric by tapping the fabric on the downstream side.

C. Silt Control Gates

Maintenance of Temporary Silt Control Gates consists of all labor, tools, materials, equipment and necessary incidentals to remove and dispose of accumulated sediment down to the original ground line (0% filled). When applicable, this item will include the removal of sediment accumulations on the fabric by tapping the fabric on the downstream side.

D. Check Dams (all types)

Maintenance of Temporary Erosion Control Check Dams shall consist of all labor, tools, materials, equipment and necessary incidentals to remove and dispose of accumulated sediment down to the original ground line (0% filled). This item also includes the removal of any material deposited in sump holes. When applicable, this item will include the removal of sediment accumulations on the fabric by tapping the fabric on the downstream side, or from the baled straw by similar means.

E. Silt Retention Barrier

Maintenance of Temporary Silt Retention Barrier consists of all labor, tools, materials, equipment and necessary incidentals to remove and dispose of accumulated sediment down to the original ground line (0% filled).

F. Temporary Sediment Basins

Maintenance of Temporary Sediment Basins consists of all labor, tools, materials, equipment and necessary incidentals to remove and dispose of accumulated sediment down to the original bottom of the basin. This also includes removing accumulated sediment from the rock filter and restoring the rock filter to its original specified condition and any work necessary to restore all other components to the pre-maintenance conditions.

G. Sediment Barrier (baled straw)

Maintenance of sediment barrier (baled straw) consists of furnishing all labor, tools, materials, equipment and necessary incidentals to remove and dispose of accumulated sediment down to the original ground line (0 % filled). Also included is the removal of sediment accumulations on the bales by tapping.

Section 165-Maintenance of Temporary Erosion and Sedimentation Control Devices

H. Triangular Silt Barrier

Maintenance of Triangular Silt Barrier consists of all labor, tools, materials, equipment and necessary incidentals to remove and dispose of accumulated sediment down to the original ground line (0% filled).

I. Retrofit:

Maintenance of the retrofit device consists of all labor, tools, materials, equipment and necessary incidentals to remove and properly dispose of accumulated sediment in the permanent detention pond being utilized as a temporary sediment basin. This item also includes any maintenance that is required to ensure the retrofit device is maintained per Plan details and any maintenance of the stone filter to maintain its filtering ability, including cleaning and replacement.

J. Construction Exit:

Maintenance of the construction exit consists of all labor, tools, materials, equipment and incidentals, including additional stone and geotextile fabric as required to prevent the tracking or flow of soil onto public roadways. This includes, scarifying existing stone, cleaning existing stone, or placement of additional stone.

Cleaning of the construction exit by scraping and/or brooming only will not be measured for payment.

K. Inlet Sediment Trap

Maintenance of inlet sediment traps consists of all labor, tools, materials, equipment and necessary incidentals to remove and properly dispose of accumulated sediment in the trap and/or the excavated area adjacent to the trap. It also includes any maintenance that is required to remove sediment accumulations ("filtercake") from the material selected to construct the inlet sediment trap.

L. Rock Filter Dams

Maintenance of rock filter dams consists of all labor, tools, materials, equipment, and necessary incidentals to remove and dispose of accumulated sediment down to the original ground line (0% filled). This item also includes the removal of any material deposited in sump holes.

M. Stone Filter Berms

Maintenance of stone filter berms consists of all labor, tools, materials, equipment, and necessary incidentals to remove and dispose of accumulated sediment down to the original ground line (0% filled). This item also includes the removal of any material deposited in sump holes.

N. Stone Filter Rings

Maintenance of stone filter rings consists of all labor, tools, materials, equipment, and necessary incidentals to remove and dispose of accumulated sediment down to the original ground line (0% filled). This item also includes the removal of any material deposited in sump holes.

165.3.06 Quality Acceptance

General Provisions 101 through 150.

165.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

165.4 Measurement

A. Temporary Silt Fence:

Maintenance of temporary silt fence, Type A, B, or C, is the actual linear feet (meter) of silt fence, measured in place, where sediment is removed.

B. Silt Control Gates:

Maintenance of temporary silt control gates, type I, II, III or IV, as specified on the Plans, is measured as a single unit.

C. Check Dams (All Types):

Maintenance of temporary erosion control check dams as specified on the Plans is the actual linear feet (meter) of baled straw, type c silt fence or rip rap, measured in place, where sediment is removed.

D. Silt Retention Barrier:

Maintenance of temporary silt retention barrier as specified on the Plans, is measured by the linear foot (meter) where sediment is removed.

E. Temporary Sediment Basins:

Maintenance of temporary sediment basins as specified on the Plans, is measured as a single unit.

F. Sediment Barrier (baled straw)

Maintenance of sediment barrier (baled straw), is the actual linear feet (meter) of baled straw measured in place, where sediment is removed.

G. Triangular Silt Barrier:

Maintenance of triangular silt barrier as specified on the plans, is measured by the linear foot (meter) where sediment is removed.

H. Retrofit:

Maintenance of retrofit device at the location specified on the Plans is measured per each.

I. Construction Exit:

Maintenance of construction exit at the location specified on the Plans, or as directed by the Engineer is measured per each.

J. Inlet Sediment Trap

Maintenance of inlet sediment trap at the location specified on the Plans, or as added by the Engineer is measured per each.

K. Rock Filter Dams

Maintenance of rock filter dams as specified on the plans is measured as a single unit.

L. Stone Filter Berms

Maintenance of stone filter berms as specified on the plans is measured as a single unit.

M. Stone Filter Rings

Maintenance of stone filter rings as specified on the plans is measured as a single unit.

Section 165-Maintenance of Temporary Erosion and Sedimentation Control Devices

165.4.01 Limits

General Provisions 101 through 150.

165.5 Payment

A. Temporary Silt Fence:

Maintenance of temporary silt fence, Type A, B, or C, is paid for at the contract unit price bid per linear foot (meter).

B. Silt Control Gates:

Maintenance of temporary silt control gates, Type I, II, III, or IV as specified on the Plans is paid for at the contract unit price bid per each.

C. Check Dams (All Types):

Maintenance of Check Dams as specified on the Plans is paid for at the contract unit price bid per linear foot (meter).

D. Silt Retention Barrier:

Maintenance of temporary silt retention barrier as specified on the Plans is paid for at the contract unit price bid per linear foot (meter).

E. Temporary Sediment Basins:

Maintenance of temporary sediment basins as specified on the Plans is paid for at the contract unit price bid per each.

F. Sediment Barrier (baled straw):

Maintenance of sediment barrier (baled straw) as specified on the Plans is paid for at the contract unit price bid per linear foot (meter).

G. Triangular Silt Barrier:

Maintenance of triangular silt barrier as specified on the Plans is paid for at the contract unit price bid per linear foot (meter).

H. Retrofit:

Maintenance of the retrofit device at the location specified on the Plans is paid for at the contract unit price bid per each.

I. Construction Exit:

Maintenance of the construction exit at the location specified on the Plans or as added by the Engineer is paid for at the contract unit price per each.

J. Inlet Sediment Trap

Maintenance of the inlet sediment trap at the location specified on the Plans or at the location specified by the Engineer is paid for at the contract unit price per each.

K. Rock Filter Dams

Maintenance of rock filter dams as specified on the plans is paid for at the contract unit price bid per each.

L. Stone Filter Berms

Maintenance of stone filter berms as specified on the plans is paid for at the contract unit price bid per each.

M. Stone Filter Rings

Section 165-Maintenance of Temporary Erosion and Sedimentation Control Devices

Maintenance of stone filter rings as specified on the plans is paid for at the contract unit price bid per each.

Payment will be made under:

Item No. 165	Maintenance of temporary silt fence Type _____	per linear foot (meter)
Item No. 165	Maintenance of silt control gate Type _____	per each
Item No. 165	Maintenance of check dams (all types)	per linear foot (meter)
Item No. 165	Maintenance of silt retention barrier	per foot (meter)
Item No. 165	Maintenance of temporary sediment basin, Sta. No. _____	per each
Item No. 165	Maintenance of sediment barrier (baled straw)	per linear foot (meter)
Item No. 165	Maintenance of triangular silt barrier	per linear foot (meter)
Item No. 165	Maintenance of retrofit, Sta. No. _____	per each
Item No. 165	Maintenance of construction exit	per each
Item No. 165	Maintenance of inlet sediment trap	per each
Item No. 165	Maintenance of rock filter dam	per each
Item No. 165	Maintenance of stone filter berm	per linear foot (meter)
Item No. 165	Maintenance of rock filter dam	per each

165.5.01 Adjustments

General Provisions 101 through 150.

Section 166—Restoration or Alteration of Lakes and Ponds

166.1 General Description

This Specification gives the Contractor responsibility for altering or restoring a lake or pond and adjoining property. Refer to Subsection 107.13, “Protection and Restoration of Property and Landscape.”

166.1.01 Definitions

In this Specification, “lake” means “lake or pond,” regardless of its shape or size. Use the method indicated on the Plans and in the Proposal.

166.1.02 Related References

A. Standard Specifications

Section 107—Legal Regulations and Responsibility to the Public

B. Referenced Documents

General Provisions 101 through 150.

166.1.03 Submittals

General Provisions 101 through 150.

166.2 Materials

Materials required to complete the work are shown on the Plans or used as directed.

166.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

166.3 Construction Requirements

166.3.01 Personnel

General Provisions 101 through 150.

166.3.02 Equipment

Provide equipment necessary to complete the work or as directed.

166.3.03 Preparation

General Provisions 101 through 150.

166.3.04 Fabrication

General Provisions 101 through 150.

166.3.05 Construction

A. Restore Lakes and Dams

When indicated on the Plans and in the Proposal, use the lake or pond area as a settling basin to contain silt, debris, or other foreign matter during the construction period.

Before the work begins, the Engineer will establish the condition of the lake and dam and determine the existing contours of the lake bottom. Restore lakes and dams as follows:

1. Remove, at no additional cost to the Department, the silt, etc., as often as necessary to avoid polluting the downstream area.

Section 166-Restoration or Alteration of Lakes and Ponds

2. When roadway work progresses enough that a normal stand of grass can prevent erosion and pollution of the lake, excavate and clean the lake of foreign matter. Return the lake to the original contour and condition or proposed contour, if different than the original.
3. Dispose of material removed in a manner satisfactory to the Engineer.
4. After removing the deleterious materials from the lake, grade and grass disturbed areas not under water.

B. Alter Lakes or Ponds

If alteration is shown as a Pay Item, work shall include activities to change the physical size, shape, or depth of the lake; or to change the high-water level, or elevation of the dam or portions of it. This work shall be done according to the Plan details.

166.3.06 Quality Acceptance

General Provisions 101 through 150.

166.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

166.4 Measurement

Alteration or restoration of a lake is measured by the unit as indicated on the Plans and in the Proposal. Payment is full compensation for all necessary labor, equipment, tools, materials and incidentals required to complete the work to the satisfaction of the Engineer.

166.4.01 Limits

General Provisions 101 through 150.

166.5 Payment

Alteration or restoration of a lake is paid for at the Contract Unit Price bid per each for the specified operation as defined in Subsection 166.3.05, "Construction." Payment is full compensation for furnishing all labor, equipment, materials, tools and incidentals, and performing the work.

A. Restoration of a Lake

When the lake or pond is used as a settling basin, the work is paid for on the following schedule:

- Ten percent of the bid amount will be paid each time the lake or pond is cleaned of silt and debris during the construction period up to four occurrences.
- The remaining amount will be paid when the final cleaning and restoration are complete and accepted.

B. Alteration of a Lake

Alteration is paid on a pro-rata basis of the bid amount as the work progresses.

Payment will be made under:

Item No. 166	Restoration of lake, sta.____	Per each
Item No. 166	Alteration of lake, sta.____	Per each

166.5.01 Adjustments

General Provisions 101 through 150.

Section 167—Water Quality Monitoring

167.1 General Description

This Specification establishes the Contractor's responsibility to meet the requirements of the National Pollutant Discharge Elimination System (NPDES) Infrastructure Permit No. GAR 100002 as it pertains to Part IV. Erosion, Sedimentation and Pollution Control Plan.

167.1.01 Definitions

Certified Personnel— certified personnel are defined as persons who have successfully completed the appropriate certification course approved by the Georgia Soil and Water Conservation Commission. For Department projects the certified person must also have successfully completed the Department's WECS certification course.

167.1.02 Related References

167.1.03 Submittals

General Provisions 101 through 150

167.2 Materials

General Provisions 101 through 150.

167.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

167.3 Construction Requirements

167.3.01 Personnel

Use certified personnel to perform all monitoring, sampling, inspections, and rainfall data collection.

Use the Contractor designated WECS or select a prequalified consultant from the Qualified Consultant List (QCL) to perform water quality monitoring.

Ensure that monitoring consultants' employees who perform monitoring, sampling, inspections, and rainfall data collection are GASWCC Certified.

167.3.02 Equipment

Provide equipment necessary to complete the Work or as directed.

167.3.03 Preparation

General Provisions 101 through 150.

167.3.04 Fabrication

General Provisions 101 through 150.

167.3.05 Construction

A. General

Perform inspections, rainfall data collection, testing of samples, and reporting the test results on the project according to the requirements in Part IV of the NPDES Infrastructure permit and this Specification.

Take samples manually or with the use of automatic samplers, according to the permit. Analyze all according to the permit, regardless of the method used to collect the samples.

If samples are analyzed in the field using portable turbidimeters, the monitoring results shall state that they are being used and a digital readout of NTUs is what is provided.

Submit bench sheets, work sheets, etc., when using portable turbidimeters. There are no exceptions to this requirement.

Perform required inspections and submit all reports required by this Specification within the time frames specified. Failure to perform the inspections within the time specified will result in the cessation of all construction activities with the exception of traffic control and erosion control. Failure to submit the required reports within the times specified will result in non-refundable deductions as specified in Subsection 161.5.01.B.

B. Inspections

The Department will provide one copy of required inspection forms for use and duplication. Inspection forms may change during the contract to reflect regulatory agency needs or the need of the Department. Any costs associated with the change of inspection forms shall be considered incidental. Alternate formats of the provided forms maybe created, used and submitted by the Contractor provided the required content and/or data fields and verbatim certification statements from the Department's current forms are included.

The Engineer shall inspect the installation and condition of each erosion control device required by the erosion control plan within seven days after initial installation. This inspection is performed for each stage of construction when new devices are installed. The WECS shall ensure all installation deficiencies reported by the Engineer are corrected within two business days.

Ensure that the inspections of the areas listed below are conducted by certified personnel and at the frequencies listed. Document all inspections on the appropriate form provided by the Department.

1. Daily:

- a. Petroleum product storage, usage and handling areas
- b. All locations where vehicles enter/exit the site

Continue these inspections until all entry and exit sites are stabilized and fuel is not stored or transferred on the site. Utilize the Daily inspection form.

2. Weekly and after Rainfall Events:

Conduct inspections on these areas every seven calendar days and within twenty-four hours after the end of a rainfall event that is 0.5 in (13 mm) or greater:

- a. Disturbed areas not permanently stabilized
- b. Material storage areas
- c. Structural control measures, Best Management Practices (BMPs)
- d. Water quality monitoring locations and equipment

Continue these inspections until all BMPs have been removed. Utilize the EC-1 Form.

3. Monthly:

Once per month, inspect all areas where final stabilization has been completed. Look for evidence of sediments or pollutants entering the drainage system and or receiving waters. Inspect all permanent erosion control devices that remain in place to verify the maintenance status and that the devices are functioning properly.

Continue these inspections until the Notice of Termination is submitted. Utilize the Monthly inspection form.

C. Reports:

1. Inspection Reports:

Summarize the results of inspections noted above in writing on the appropriate Daily, Weekly, Monthly or EC-1 form provided by the Department. Include the following information:

- Date(s) of inspection
- Name of personnel performing inspection
- Status of devices
- Observations
- Action taken
- Signature of personnel performing the inspection
- Any incidents of non-compliance

The inspection form certification sheet shall be signed by the project WECS and the inspector performing inspections on behalf of the WECS (if not the same person).

Submit all inspection reports to the Engineer within twenty-four hours of the inspection.

The Engineer will review the submitted reports and inspect the project to determine their accuracy.

The Engineer will notify the certified personnel of any additional items that should be added to the inspection report.

Correct any items listed in the inspection report requiring routine maintenance within 72 (seventy –two) hours of notification.

Assume responsibility for all costs associated with additional sampling as specified in Part IV.D.6.d.3.(c) of the NPDES GAR 100002 permit if either of these conditions arise:

- BMPs shown in the Plans are not properly installed and maintained, or
- BMPs designed by the Contractor are not properly designed, installed and maintained.

2. Monitoring Reports

a. Report Requirements

Include in all reports, the following certification statement, signed by the WECS or consultant providing monitoring on the project:

“I certify under penalty of law that this document and all attachments were prepared under my direct supervision in accordance with a system designed to assure that certified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.”

b. When a rainfall event requires a sample to be taken, submit a report of the monitoring results to the Engineer within seven working days of the date the sample was obtained. Include the following information:

- 1.) Date of sampling
- 2.) Rainfall amount on sample date (sample date only)
- 3.) NTU of sample & analysis method
- 4.) Location where sample was taken (station number, etc.)
- 5.) Receiving water or outfall sample
- 6.) Project number and county

7.) Whether the sample was taken by automatic sampler or manually (grab sample)

c. Report Requirements with No Qualifying Rainfall Events

In the event that a qualifying rainfall event does not occur prior to the submittal of the NOT (Notice of Termination), submit a report that states “No qualifying rainfall event occurred and no samples were taken.”

d. Test Results

Provide monitoring test results to the Engineer within 48 hours of the samples being analyzed. This notification may be verbal or written. This notification does not replace the requirement to submit the formal monitoring summary to the Engineer within 7 working days of the samples being collected.

3. Rainfall Data Reports

Record the measurement of rainfall once each twenty-four hour period. Measure rainfall data at the active phase of construction on the site.

Project rain gauges and those used to trigger the automatic samplers are to be emptied after every rainfall event. This will prevent a cumulative effect and prevent automatic samplers from taking samples even though the rainfall event was not a qualifying event.

The daily rainfall data supplied by the WECS to the Engineer will be the official rainfall data for the project.

167.3.06 Quality Acceptance

General Provisions 101 through 150.

167.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

167.4 Measurement

Water Quality Inspections in accordance with the inspection and reports sub-sections will be measured for payment by the month up to the time the Contract Time expires. Required inspections and reports after Contract Time has expired will not be measured for payment.

Water Quality Monitoring and Sampling are measured per each. When the monitoring location is receiving water, the upstream and downstream samples constitute one sample. When the monitoring location is an outfall, a single outfall sample constitutes one sample.

167.4.01 Limits

General Provisions 101 through 150. Submit the monitoring summary report to the Engineer within 7 working days

167.5 Payment

Payment for Water Quality Monitoring and Sampling will be made as follows:

Water Quality Monitoring and Sampling per each is full compensation for meeting the requirements of the monitoring sections of the NPDES permit and this Specification, obtaining samples, analyzing samples, any and all necessary incidentals, and providing results of turbidity tests to the Engineer, within the time frame required by the NPDES Infrastructure permit, and this Specification.

This item is based on the rainfall events that require sampling as described in Part IV.D.5 of the permit.

The Department will not pay for samples taken and analyzed for rainfall events that are not qualifying events as compared to the daily rainfall data supplied by the WECS.

Water Quality Inspections will be paid at the Contract Price per month. This is full compensation for performing the requirements of the inspection section of the NPDES permit and this Specification, any and all necessary incidentals, and providing results of inspections to the Engineer, within the time frame required by the NPDES Infrastructure permit, and this Specification.

Payment will be made under:

Item No. 167	Water quality inspections	Per month
--------------	---------------------------	-----------

Water Quality Monitoring and Sampling will be paid per each.

Payment will be made under:

Item No. 167	Water quality monitoring and sampling	Per each
--------------	---------------------------------------	----------

167.5.01 Adjustments

General Provisions 101 through 150.

Section 168—Comprehensive Monitoring Program

168.1 General Description

Specifications for this work will be included elsewhere in the contract.

Section 170—Silt Retention Barrier

170.1 General Description

This work includes controlling water pollution where embankment construction or material removal may cause stream pollution.

Requirements of Sections 161, 162, and 163 apply to this Item. However, payment will not be made for erosion control items in those sections used with this work.

170.1.01 Definitions

General Provisions 101 through 150.

170.1.02 Related References

A. Standard Specifications

Section 161—Control of Soil Erosion and Sedimentation

Section 162—Erosion Control Check Dams

Section 163—Miscellaneous Erosion Control Items

Section 171—Temporary Silt Fence

B. Referenced Documents

General Provisions 101 through 150.

170.1.03 Submittals

General Provisions 101 through 150.

170.2 Materials

Use suitable permeable or impermeable materials. These materials include canvas duck, clear or black polyethylene film, or fabric that meets the requirements of Type C, temporary silt fence, found in Section 171.

Alternate solutions and materials may be used if Engineer approves.

Use barriers long enough and wide enough to control turbidity.

170.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

170.3 Construction Requirements

170.3.01 Personnel

General Provisions 101 through 150.

170.3.02 Equipment

General Provisions 101 through 150.

170.3.03 Preparation

General Provisions 101 through 150.

170.3.04 Fabrication

General Provisions 101 through 150.

170.3.05 Construction

Install a silt retention barrier as follows: Barriers shall be either staked or floating depending upon current, tides, water depth, and other variables, or as shown in the plans and contract.

A. Floating Silt Retention Barrier

1. Confine dredged materials to ponding areas or settlement basins using standpipes or weirs.
2. Place the barrier approximately 25 ft (7.5 m) outside the affected construction area, and at a depth within 5 ft (1.5 m) of the bottom.
3. If the body of water has a significant current, place the barrier parallel to the water flow.
4. Vary the dimensions and methods to suit the conditions and to meet the requirements of other local and State water control agencies to ensure that silt dispersion is effectively controlled.
5. Provide a fabric that is weighted to prevent the bottom from floating.

B. Staked Silt Retention Barrier

1. Where a staked barrier is used to protect a stream or inundated area, ensure the fabric:
 - a. Extends to the bottom of the stream or inundated area and is weighted to prevent it from floating
 - b. Is not trenched in at the bottom
 - c. Extends 1 foot (300 mm) above normal water
2. Posts:

Options: Either 2 inch (50 mm) x 4 inch (100 mm) wood, 2 ½ inch (62.5 mm min. diameter) wood, or steel at a minimum of 1.33 pounds per foot (1.980 kg/m)

 - a. space posts at a maximum spacing of 4 feet (1.2 m)
 - b. posts are minimum of 5 feet (1.5 m) in length
 - c. posts extend a minimum of 18 inches (450 mm) into the soil

170.3.06 Quality Acceptance

General Provisions 101 through 150.

170.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

170.4 Measurement

Silt retention barriers, either floating or staked, are measured by the linear foot (meter) of barrier required to prevent siltation and pollution.

170.4.01 Limits

General Provisions 101 through 150.

170.5 Payment

The applicable requirements of Sections 161, 162, and 163 apply to this Item, except that the erosion control items contained in those sections will not be paid for when used in conjunction with this work.

Silt retention barriers will be paid for at the Contract Unit Price for each barrier, complete in place and accepted. Payment is full compensation for furnishing materials, erecting the barrier, removing, and disposing of the barrier when no longer required.

Payment will be made under:

Item No. 170	Floating silt retention barrier	Per linear foot (meter)
Item No. 170	Staked silt retention barrier	Per linear foot (meter)

170.5.01 Adjustments

General Provisions 101 through 150.

Section 171—Silt Fence

171.1 General Description

This work includes furnishing, installing, and removing a water permeable filter fabric fence to remove suspended particles from drainage water.

171.1.03 Submittals

General Provisions 101 through 150.

171.2 Materials

Materials shall meet the requirements of the following Specifications:

Material	Section
Filter Fabrics	881
Fencing	894
Wood Posts and Bracing	862

Conditions during Project construction will affect the quantity of the silt fence to be installed.

The Engineer may increase, decrease, or eliminate the quantity at his or her direction. Variations in quantity are not changes in details of construction or in the character of the work.

For Type A, B, and C fences, use fabric as specified in Subsection 881.2.07, “Silt Fence Filter Fabric.”

171.2.01 Delivery, Storage, and Handling

During shipment and storage, wrap the fabric in a heavy-duty covering that will protect the cloth from sunlight, mud, dust, dirt, and debris. Do not expose the fabric to temperatures greater than 140 °F (60 °C).

When installed, the Engineer will reject the fabric if it has defects, rips, holes, flaws, deterioration, or damage incurred during manufacture, transportation, or storage.

171.3 Construction Requirements

171.3.01 Personnel

General Provisions 101 through 150.

171.3.02 Equipment

General Provisions 101 through 150.

171.3.03 Preparation

General Provisions 101 through 150.

171.3.04 Fabrication

General Provisions 101 through 150.

171.3.05 Construction

Install the silt fence according to this Specification, as shown on the Plans, or as directed by the Engineer as; perimeter, ditch check or similar protection.

A. Install Silt Fence

1. Install silt fence by either of the following methods:
 - a. Excavated Trench Method
Excavate a trench 4 to 6 in (100 to 150 mm) deep using equipment such as a trenching machine or motor grader. If equipment cannot be operated on the site, excavate the trench by hand.
 - b. Soil Slicing Method

Create a mechanical slice in the soil 8 to 12 in (200 to 300 mm) deep to receive the silt fence. Ensure that the width of the slice is not more than 3 in (75 mm). Mechanically insert the silt fence fabric into the slice in a simultaneous operation with the slicing that ensures consistent depth and placement.

2. Install the first post at the center of the low point (if applicable). Space the remaining posts a maximum of 6 ft (1.8 m) apart for Types A and B fence and 4 ft (1.2 m) apart for Type C fence.
3. Bury the posts at least 18 in (450 mm) into the ground. If this depth cannot be attained, secure the posts enough to prevent the fence from overturning from sediment loading.
4. Attach the filter fabric to the post using wire, cord, staples, nails, pockets, or other acceptable means.
 - a. **Staples and Nails (Wood Posts):** Evenly space staples or nails with at least five per post for Type A fence and four per post for Type B fence.
 - b. **Pockets:** If using pockets and they are not closed at the top, attach the fabric to a wood post using at least one additional staple or nail, or to a steel post using wire. Ensure that the additional attachment is within the top 6 in (150 mm) of the fabric.
 - c. Install the filter fabric so that 6 to 8 in (150 to 200 mm) of fabric is left at the bottom to be buried. Provide a minimum overlap of 18 in (450 mm) at all splice joints.
 - d. For Type C fence:
 1. Woven Wire Supported
 - Steel Post: Use wire to attach the fabric to the top of the woven wire support fence at the midpoint between posts. Also, use wire to attach the fabric to the post.
 2. Polypropylene Mesh Supported
 - Wood Post: Use at least six staples per post. Use two staples in a crisscross or parallel pattern to secure the top portion of the fence. Evenly space the remaining staples down the post.
 - Steel Post: Use wire to attach the fabric and polypropylene mesh to the post.
5. Install the fabric in the trench so that 4 to 6 in (100 to 150 mm) of fabric is against the side of the trench with 2 to 4 in (50 to 100 mm) of fabric across the bottom in the upstream direction.
6. Backfill and compact the trench to ensure that flow cannot pass under the barrier. When the slice method is used, compact the soil disturbed by the slice on the upstream side of the silt fence first, and then compact the downstream side.
7. When installing a silt fence across a waterway that produces significant runoff, place a settling basin in front of the fence to handle the sediment load, if required. Construct a suitable sump hole or storage area according to Section 163.

B. Install silt fence ditch checks

1. Temporary Silt Fence Ditch Checks

Temporary silt fence ditch checks shall be constructed of the material type selected and shown on the approved erosion and sediment control plan. Item installation shall be constructed and placed according to approved Plan details. Temporary ditch checks shall remain in place until the permanent ditch protection is in place or being installed and the removal is approved by the Engineer.

C. Remove the Silt Fence

1. Keep all silt fences in place unless or until the Engineer directs it to be removed. A removed silt fence may be used at other locations if the Engineer approves of its condition.
2. After removing the silt fence, dress-the area to natural ground, grass-and mulch the area according to Section 700.
3. The silt fence shall remain until the Project is accepted or until the fence is removed. Also, remove and dispose of the silt accumulations at the silt fence.

4. Remove and replace any deteriorated filter fabric that reduces the effectiveness of the silt fence.
5. Repair or replace any undermined silt fence at no additional cost to the Department.

171.3.06 Quality Acceptance

Approved silt fence is listed in QPL 36. Approved fabrics must consistently exceed the minimum requirements of this Specification as verified by the Office of Materials. The Office of Materials will remove fabric that fails to meet the minimum requirements of this specification from the QPL until the products' acceptability has been reestablished to the Department's satisfaction.

At the time of installation, the Engineer will reject the fabric if it has defects, rips, holes, flaws, deterioration, or damage incurred during manufacture, transportation, or storage.

171.3.07 Contractor Warranty

The silt fence shall remain until the Project is accepted or until the fence is removed. Also, remove and dispose of the silt accumulations at the silt fence.

Remove and replace any deteriorated filter fabric that reduces the effectiveness of the silt fence.

Repair or replace any undermined silt fence at no additional cost to the Department.

171.4 Measurement

The quantity of silt fence, silt fence ditch checks to be paid for is the actual number of linear feet (meters) of silt fence, measured in place from end post to end post of each separate installation. The silt fence must be complete and accepted.

171.4.01 Limits

General Provisions 101 through 150.

171.5 Payment

Silt fence Type A, B, or C measured as defined in Subsection 171.4, "Measurement," is paid for at the Contract Unit Price bid per linear foot (meter).

Payment is full compensation for the following:

- Furnishing materials
- Erecting the fence
- Dressing and grassing, when required
- Removing the fence, when required

Payment for this Item is made as follows:

- Seventy-five percent of the Contract Price bid per linear foot (meter) is paid when each fence is complete in place.
- Twenty-five percent is paid at removal or acceptance.

If the silt fence must be repaired or removed, as the result of neglect or damage, perform the work at no additional cost to the Department.

Payment will be made under:

Item No. 171	Silt fence, type__	Per linear foot (meter)
--------------	--------------------	-------------------------

171.5.01 Adjustments

General Provisions 101 through 150.

Section 172—Soil Test Boring

172.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 201—Clearing and Grubbing Right of Way

201.1 General Description

This work includes clearing, grubbing, removing and disposing of vegetation, buildings and debris within the entire Right-of-Way and easement areas adjacent to the Right-of-Way or as designated by the Engineer. Except, do not remove objects designated to remain or removed according to other sections of these Specifications. This work also includes preserving (from injury and defacement) vegetation and objects designated to remain in place.

201.1.01 Definitions

Clearing: Removing and disposing trees, brush, stumps, logs, grass, weeds, roots, decayed vegetable matter, poles, stubs, rubbish, refuse dumps, sawdust piles, and loose boulders of 1 yd³ (1 m³) or less existing outside of the construction limits, debris resting on or protruding through the ground surface, or appearing on the Right-of-Way before final acceptance of the work.

Clearing also includes removing and disposing of obstructions, such as fences, bridges, buildings, and other incidental structures within the Right-of-Way unless the work or a portion of the work is:

- Removed as excavation
- Shown in the Proposal as a separate Pay Item
- Performed by others

Grubbing: Removal from the Right-of-Way and proper disposal of all objectionable matter defined above under clearing, which is embedded in the underlying soil.

Grubbing also includes removing and properly disposing of parking lots, abandoned pavements, sidewalks, driveways, catch basins, drop inlets, pipes, manholes, curbing, retaining walls, utilities, foundations, paved floors, underground tanks (for removal of underground tanks see Section 217), and other structures within the Right-of-Way unless the work or portions of the work are:

- Obstructions removed as one of the excavation items
- Shown in the Proposal as separate Pay Items
- Removed by others
- To be incorporated in the project.

Objectionable Roots: Any of the following types of roots:

- Matted trees and brush roots (regardless of the size of the roots)
- Individual roots more than 0.75 in (20 mm) diameter
- Individual roots more than 3 ft (1 m) long regardless of size
- Large quantities of smaller roots present in the top 1 ft (300 mm) of the finished subgrade or road surface when detrimental to the work as determined by the Engineer.

Stumps: The butt of a tree with a diameter of 4 in (100 mm) or more.

General Provisions 101 through 150.

201.3.05 Construction

A. General

Establish Right-of-Way and construction lines. The Engineer will designate which trees, shrubs, and plants will remain in the ground. Preserve things designated to remain.

Apply the requirements of Subsection 107.22, Subsection 107.23, and Section 161 to clearing and grubbing operations.

Strip grass immediately ahead of grading.

To prevent the spread of “Introduced Invasive Pest Species”, do the following:

1. Adhere to the restrictions of Section 155.3.05.A for moving soil, mulch, sod or plants, stump wood or timber with soil attached.

2. Adhere to the requirements of Section 155.3.05.B for cleaning of equipment, except that the USDA inspection will not be required for vegetative matter.
3. Dispose of vegetative parts of plants that may reproduce (roots and aboveground parts that bear fruit) by burning on site (where permitted) or bury with a minimum cover of 3 feet (1 meter) at an approved site. Obtain the Engineer's approval for any other methods of disposal.

B. Clearing

Clear objects within the Right-of-Way and easement areas as follows:

1. Choose a method of clearing that prevents damage to property, trees, or retained shrubbery in or outside of the Right-of-Way.
2. Remove stumps that are part of the clearing operations as specified under Subsection 201.3.05.C, "Grubbing".
3. Cut the stumps not grubbed as specified in this section.
4. Dispose of cleared materials as specified in Subsection 201.3.05.E.

C. Grubbing

Grubbing consists of removing and disposing objectionable matter embedded in the underlying soil (defined in Subsection 201.3.05.B, "Clearing") from the Right-of-Way and easement areas.

1. Grubbing Operations

When grubbing, remove abandoned obstructions referenced in Subsection 201.1.01 "Definitions" to the following depths:

- a. Under Pavements: Remove to a depth of at least 3 ft (1 m) below the finished subgrade.
- b. Underneath Other Structures: Remove to at least 3 ft (1 m) below the foundations of any proposed structure, including installations such as guard rail posts and utility poles.
- c. Elsewhere in the Right-of-Way and easement areas: Remove as follows:
 - 1) Remove to at least 3 ft (1 m) below the finished surface of slopes and shoulders and 1 ft (300 mm) below natural ground outside construction lines.
 - 2) Thoroughly crack or break abandoned structures that may impound water. These structures include concrete floors, basements, and catch basins within 10 ft (3 m) of finished grade.
 - 3) Break floors so that no section greater than 10 ft² (1 m²) remains intact.
5. Except as modified under Subsection 201.3.05.D, use the following procedure to perform grubbing:
 - a. Remove stumps and other matter that cannot be removed by a root rake. Remove stumps to a minimum depth of 2 ft (600 mm) below the ground line.
 - b. Rake areas containing objectionable roots to a depth of at least 6 in (150 mm) below the surface.
 - c. Remove remaining objectionable matter by hand or other suitable means. When necessary, remove small roots (see Subsection 201.1.01 "Objectionable Roots") detrimental to the work.
 - d. Backfill stump holes and compact backfill to the approximate density of the surrounding soil.
 - e. Harrow the area with a heavy-duty disc harrow that penetrates and turns the ground to at least 6 in (150 mm) deep.
 - f. Remove objectionable matter exposed by the harrowing.
 - g. Level the harrowed areas with blading equipment. Leave the grubbed areas smooth enough for a power mower.

D. Modifications of Clearing and Grubbing

Modify clearing and grubbing as follows:

1. In Excavation Areas

Modify clearing and grubbing in excavation areas as follows:

- a. Harrowing and leveling may be omitted.
- b. Do not fill stump holes except when the bottom of any stump hole extends below the elevation of the finished subgrade. In this case, fill the portion of each hole below subgrade elevation with suitable material compacted to at least the density of the surrounding soil.

2. In Embankment Areas

Modify clearing and grubbing in embankment areas as follows:

- a. Under 4.5 ft (1.4 m)

Clear and grub areas without modification where the original ground and finished grade differ in elevation 4.5 ft (1.4 m) or less.
- b. Over 4.5 ft (1.4 m)

Clear, but do not grub areas covered by embankments exceeding the 4.5 ft (1.4 m) elevation difference specified in step (a) above. Except the removal of unsound or decayed stumps.

Remove and backfill stumps according to Subsection 201.3.05.C.2. When leaving sound stumps in place, cut them off to no more than 6 in (150 mm) above the original ground line.
- c. Embankment Areas Over Old Roads

Clear and grub without modification ditches and slopes of old roads to a depth that removes all objectionable matter to provide a firm foundation.

3. Areas Outside of Roadway

Except as specified in this section, clear and grub the entire Right-of-Way and easement areas outside construction limits and leave it smooth and free from loose boulders and debris that would interfere with power mowers.

Exceptions to the above requirements are as follows:

- a. Selective Clearing

When the Engineer directs to preserve certain trees and plants, protect them from injury. Trees to be removed shall be felled to prevent injury to standing trees, plants, and improvements to be preserved.

Cut off tree branches overhanging the roadway within 20 ft (6 m) of the finished grade close to the boles. Also, remove other branches to create a balanced appearance. Grub areas adjacent to selected trees and shrubs without damage to living roots of the selected trees or shrubs.
- b. Special Treatment Areas

Clear special treatment areas according to the Plan notes.
- c. Steep Slopes

Clear or selectively clear slopes that are too steep for power mowers (slopes steeper than 3 horizontal to 1 vertical) and clear or selectively clear slopes that are subject to excessive erosion. Do not grub in these areas.
- d. Grassed Areas

Do not grub (if the Engineer approves) reasonably large areas outside construction limits covered with grasses and smooth enough for power mowers. Remove stumps, trees, and other objectionable matter.

4. Bridge Sites

Modify clearing and grubbing at bridge sites as follows:

- a. Stream Bridges

Clear the Right-of-Way for stream bridges for the full length of the proposed structure. Cut stumps and brush flush with the ground line.

The Engineer will require a second cutting if high water prevents cutting stumps flush with the ground. If the Engineer requires more than two cuttings, see Subsection 201.5 for payment.

Remove drift and stumps where necessary to permit installation of rip rap, piling, piers, abutments, wing walls, and bents. Properly backfill the holes.

Preserve stump and brush root systems at river and stream banks when they have been cut flush with the ground line.

b. Other Bridges

Clear and grub bridges (other than stream bridges) as specified within this specification for roadway areas and areas outside of the roadway.

E. Removal and Disposal of Materials

1. Merchantable Timber and Buildings

The Department may dispose of merchantable timber and buildings, or may allow a property owner to remove them from the land granted for Right-of-Way before the Contractor begins operation. Therefore, the Department does not guarantee that merchantable timber or buildings will be on the Right-of-Way when the work begins.

Material salvaged from removing timber or buildings becomes the property of the Contractor.

Demolish, remove, and dispose of all building structures within the right of way and easement areas including concrete slabs, footings, foundations, etc. except building structures designated to remain in place. Grade to drain all disturbed ground to a reasonably smooth and pleasing appearance, free from loose boulders and other debris that would interfere with the use of power mowers. Grass all disturbed areas.

Prior to demolition or removal:

- a. Inspect all building structures for the presence of asbestos. The inspection shall be done by an EPA Asbestos Hazard Emergency Response Act (AHERA) accredited inspector whose certification is current.
- b. Provide a copy of all inspection reports including the inspector's credentials to the Engineer.
- c. Provide written notice of intent to demolish to the Georgia Environmental Protection Division (EPD) of the Georgia Department of Natural Resources in accordance with EPD regulations with a copy to the engineer. This notice is required even if there is no asbestos present.

If there is asbestos present, its removal shall be done by a contractor licensed with the EPD in accordance with the Rules of Georgia Department of Natural Resource Environmental Protection Division chapter 391-3-14-04. All asbestos removal and disposal shall be done in accordance with EPD regulations. All asbestos removal shall be considered as Extra Work and payment will be made in accordance with Subsection 109.05.

2. Combustible Material

Abide by Federal, State, and local codes when the Right-of-Way (or any portion of the Right-of-Way) lies within an area where burning is restricted. All combustible material except sawdust piles may be burned on the Right-of-Way except where prohibited by Federal, State, or local air pollution control regulations.

- a. Prevent fire from spreading to adjacent areas and damaging living trees and shrubs designated to remain on the Right-of-Way and easement areas.
- b. Prevent damage to public and private installations either within or adjacent to the Right-of-Way and prevent damage to traveling public.
- c. Obtain suitable areas for burning the combustible material when necessary (at the Contractor's expense). Burning area are subject to the approval of the Engineer.
- d. Dispose of unburned combustible material according to Subsection 201.3.05.E.3. If the disposal area is located on private property, present written authority to the Engineer (signed by the property owner) granting the Contractor and the Department permission to use the area for the purpose intended. Reclaim the disposal area according to Section 160 except that the reclamation is at the Contractor's expense.
- e. Completely remove sawdust within the construction limits. Haul the sawdust to approved disposal areas, or deposit it on the Right-of-Way in a layer less than 3 in (75 mm) deep. Immediately mix the sawdust with the underlying soil by discing and harrowing. Leave the harrowed surface smooth.

3. Solid Waste Material

Place solid waste material either in the embankment (provided the material is satisfactory for embankment construction) or in a Department-approved solid waste disposal site.

The classification of non-regulated and regulated solid waste materials are defined by the Environmental Protection Division (EPD) of the Georgia Department of Natural Resources (GDNR) rules and regulations. Dispose of these materials using the following procedures.

a. Non-regulated Solid Waste Material

- 1) Excess material such as soil, rock, brick, concrete (with and without reinforcement), and cured asphalt may be placed within the Right-of-Way, provided there is available room. Place these materials according to Section 208 and as directed by the Engineer.
- 2) Common fill such as soil, rock, brick, and concrete (with and without reinforcement) may be placed outside the Right-of-Way. Place the material in uniform layers 3 ft (1 m) thick or less and distributed to avoid pockets. Fill voids with finer material. Cover the last layer of fill with at least 2 ft (600 mm) of soil. Construct the fill according to Section 208, except compact it to at least 90 percent of the maximum laboratory dry density.
- 3) Materials that may be recycled or reused such as asphaltic concrete, Portland cement concrete, plastic, metal, and materials that qualify under EPD regulations for sale or use may be reclaimed by the Contractor.

b. Regulated Material

- 1) Obtain an inert landfill permit according to GDNR/EPD rules for the following material disposed of off the R/W: Inert waste items listed in Subsection 201.3.05.E.3.a if not properly layered and compacted, and organic debris such as stumps, limbs and leaves, cured asphalt. Or, take the material to a permitted solid waste landfill.
- 2) Take other regulated construction/demolition and non-hazardous solid waste, such as forms, barrels, plastic, and other by-products of construction to a construction/demolition landfill or to a municipal solid waste landfill.
- 3) Dispose of oils, solvents, fuels, untreated lead paint residue, and other solid hazardous waste through a properly licensed hazardous waste disposal facility.

Remove municipal solid waste discovered during construction or shown on the Plans according to Section 215.

201.3.06 Quality Acceptance

General Provisions 101 through 150.

201.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

201.4 Measurement

The Department does not measure clearing and grubbing separately for payment. The area is considered the full Right-of-Way width for the length of the Project including slope and construction easement areas shown on the Plans.

201.4.01 Limits

General Provisions 101 through 150.

201.5 Payment

Payment for this Item, completed and accepted, will be made at the lump sum price bid. The payment will be full compensation for all work specified in this Section including final cleanup as required.

If the Engineer requires more than two cuttings to clear the Right-of-Way for stream bridges (according to Subsection 201.3.05.D.4.a), the additional cuttings will be paid for as a Force Account according to Subsection 109.05.

No separate payment will be made for the disposal of solid waste materials.

Payment will be made under:

Item No. 201	Clearing and grubbing	Per lump sum
--------------	-----------------------	--------------

201.5.01 Adjustments

General Provisions 101 through 150.

Section 202—Random Clearing and Grubbing

202.1 General Description

This work includes clearing and grubbing borrow and material pits. See Subsection 107.23. It also includes such ditch inlets, outlets, channel changes, and easement areas where clearing and grubbing are required but not shown on the Plans.

202.1.01 Definitions

202.3.06 Quality Acceptance

General Provisions 101 through 150.

202.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

202.4 Measurement

The area of completed and accepted clearing and grubbing is measured in acres (hectares). Only the area cleared and grubbed as shown on the Plans or as designated by the Engineer is measured.

The Department will make no separate payment for removing grass, weeds, debris, small underbrush, other vegetation from cultivated lands, and isolated trees or stumps. Include the cost for removing these items in the price bid for other Pay Items.

202.4.01 Limits

General Provisions 101 through 150.

202.5 Payment

The Department will pay for Clearing and Grubbing and Clearing at the Contract Unit Price per acre (hectare), which is full compensation for all work specified.

Payment will be made under:

Item No. 202	Clearing and grubbing	Per acre (hectare)
Item No. 202	Clearing	Per acre (hectare)

202.5.01 Adjustments

General Provisions 101 through 150.

Section 203—Foundation Exploration

203.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 204—Channel Excavation

204.1 General Description

This work includes excavating and properly disposing of material encountered when changing, cleaning, or widening waterway channels. Excavation for inlet ditches, outlet ditches, tail ditches, and take-off, intercepting, side, or berm ditches will not be classified as channel excavation. This work is included in Section 205

General Provisions 101 through 150.

204.3.04 Fabrication

General Provisions 101 through 150.

204.3.05 Construction

Excavate channel to the lines, grades, typical sections, and details shown on the Plans or established by the Engineer.

Coordinate the work with grading, constructing drainage structures, and performing other work on the project.

1. Maintain the channel to ensure continued adequate drainage until Final Acceptance of the Project.
2. Use suitable excavated material as defined in the Plans, or permitted by the Engineer, when constructing roadway embankments.
3. Waste and deposit all surplus excavated material as follows:
 - a. Do not deposit material from channel excavation within 3ft (1 m) of the channel edge.
 - b. Do not deposit excavated material within jurisdictional wetlands, either on or off the Right-of-Way.
 - c. The Engineer may permit surplus material to be wasted in flushing out slopes if ditch lines, slope stability, and other features are not impaired. Do not leave material in unsightly piles. Spread it in uniform layers, neatly leveled and shaped. Leave adequate openings in spoil banks to allow adjacent land surfaces to drain.
 - d. Apply provisions pertaining to soil erosion and stream pollution to this work.

204.3.06 Quality Acceptance

General Provisions 101 through 150.

204.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

204.4 Measurement

Channel excavation, authorized and accepted by the Engineer, is measured in its original position by the method of average end areas.

204.4.01 Limits

General Provisions 101 through 150.

204.5 Payment

The Department will pay for the quantity of channel excavation as measured above at the Contract Unit Price per cubic yard (meter). Payment will not be made for excavation beyond the authorized typical sections, grades, or lengths established by the Engineer.

Payment will be made under:

Item No. 204	Channel excavation	Per cubic yard (meter)
--------------	--------------------	------------------------

204.5.01 Adjustments

General Provisions 101 through 150.

Section 205—Roadway Excavation

205.1 General Description

Roadway excavation shall conform to the lines, grades, and cross-sections shown on the Plans or established by the Engineer.

If artifacts of historical or archaeological significance are encountered, temporarily stop excavation operations until directed by the Engineer. See Subsection 107.13.A.

Roadway excavation includes the following:

- Excavating, hauling, and placing or disposing of materials (not removed under another Contract Item) from within the limits of areas designated in the Contract.
- Excavating ditches (except channel excavation) and filling and/or plugging abandoned wells (both dug and drilled) located within the Right-of-Way and construction easements according to Georgia Standard 9031H.
- Removing paving, aggregates, and ballast not incorporated into the new work as a result of alignment shifts, grade changes, or reasons that may or may not be shown on the Plans.
- Salvaging aggregates, paving, (only if designated on the Plans) and removed railroad ballast.
- The Department claims salvaged materials unless the Engineer directs that materials be wasted. Dispose of materials not salvaged. Stockpile salvaged materials on the Project unless other sites for stockpiling are shown on the Plans.

General Provisions 101 through 150.

205.1.03 Submittals

General Provisions 101 through 150.

205.2 Materials

Define excavated material, regardless of its nature or composition, as “unclassified excavation” unless otherwise specified in the Plans.

The Engineer will designate materials that are unsuitable.

205.2.01 Delivery, Storage, and Handling

A. Disposal of Surplus Material

Unless directed by the Engineer, do not waste excavated material until satisfying embankment and backfill requirements, unless material is designated on the Plans as “Unsuitable for embankment or backfill construction.”

Dispose of materials to be wasted according to Subsection 201.3.05.E and the following information:

- Use suitable surplus material to widen embankments uniformly or to flatten fill slopes, or deposit the material in places on the Right-of-Way as directed by the Engineer.
- Do not leave an unsightly pile of material that will damage abutting property or deposit material above the grade of the adjacent roadway unless so directed by the Engineer.
- Do not place the edge of a waste bank nearer than 10 ft (3 m) from the top of a cut slope.

Dispose of unsuitable and surplus materials unless they are used as fill for slopes, abandoned ditches, or other areas shown on the Plans.

- Deposit unsuitable material excavated from ditches and do not allow it to remain within 3 ft (1 m) of the ditch edge. Spread material neatly in level, uniform layers.
- Use suitable materials from ditches for constructing roadway embankments unless otherwise directed by the Engineer.

B. Waste Disposal Areas

When unable to dispose of unsuitable or surplus excavation material on the Right-of-Way, dispose of it in the following areas:

1. Disposal Areas Shown on Plans

Check disposal areas shown on the Plans. They may or may not be adjacent to the Right-of-Way.

When shown on the Plans, the Department will obtain Right-of-Way or easement to permit disposal of material. The Plans contain the amounts of royalties and the conditions for the acquiring of the waste easement.

When the Department furnishes the waste areas, and the Engineer provides measurements of the area used, do the following:

- a. Promptly pay royalties to the owners of waste pits.
- b. Meet other conditions agreed to with the owners.

- c. Submit to the Engineer a written statement signed by the owner stating that the owner has been paid in full and the agreed conditions, including proper draining and final clean-up, have been fulfilled to the owner's satisfaction before receiving final payment from the Department.

The Department will not make separate payment for these costs of acquisition.

If the property owner is not paid within 60 days after the Engineer has furnished the measurement, the Department may pay the property owner directly any amounts due, and deduct it from funds due the Contractor.

This provision does not affect the obligation of the Contractor under his bond or the rights of the property owner or the Department under the bond.

In case of dispute between the Contractor and the Department, the Chief Engineer will make the final and conclusive decision.

When disposal areas are shown on the Plans and are elected to be used, comply with the terms of the option before resorting to other areas.

2. Disposal Areas Not Shown on Plans

When waste disposal areas are not shown on the Plans, obtain suitable disposal areas at no expense to the Department.

Exercise the right to sell or otherwise dispose of the surplus material in these cases. (See Subsection 107.22 and Subsection 107.23.)

3. Reclamation

Reclaim disposal areas according to Section 160.

205.3 Construction Requirements

205.3.01 Personnel

General Provisions 101 through 150.

205.3.02 Equipment

General Provisions 101 through 150.

205.3.03 Preparation

General Provisions 101 through 150.

205.3.04 Fabrication

General Provisions 101 through 150.

205.3.05 Construction

Perform roadway excavation according to the Plans, and all of the requirements of this Subsection.

1. Provide adequate openings in spoil banks to allow the adjacent land surface to drain.
2. To carry water from the side hill, cut surface ditches at the top of cut slopes that extend to each end of the cuts.
3. Turn side ditches or gutters that empty from cuts to embankments outward to avoid embankment erosion.
4. Discharge water from surface ditches at terraces or in tail ditches cut along contour lines (wherever possible).
5. Provide outlets or flumes for roadway ditches where necessary according to the Plans.
Surface ditches, outlets, and other such ditches will be paid for as "unclassified excavation."
6. Uniformly round the intersection of cut slopes with natural ground surfaces, including the beginning and end of cut slopes.
7. Bring cut slopes to the grade and cross-section shown on the Plans or established by the Engineer.
8. Finish to reasonably uniform surfaces acceptable for seeding and mulching operations.
9. Dispose of material from slides and overbreaks that occur before Final Acceptance as directed by the Engineer.

A. Constructing Serrated Slopes

Construct serrated slopes as follows:

1. Grade the backslope according to the Construction Detail.
The pay line is the template line or the final staked cross-section slope line. The Department will not make additional measurement or payment for constructing serrated slopes.
2. Start the first serration (step) as designated on the Construction Detail. Ensure that it is level instead of parallel to the roadway grade.
3. Use the tilt-control blade bulldozer to cut steps in alternate directions.

B. Constructing Non-serrated Slopes

Construct non-serrated slopes by leaving the front and back slopes in a roughened condition to provide a seed bed for temporary or permanent grassing operations.

C. Erosion and Siltation Control

Take the measures necessary throughout the Project to control erosion and to prevent silting of rivers, streams, and impoundments. Construct drainage facilities and perform all other construction work that contributes to erosion and siltation control in conjunction with earthwork operations as required by Section 161.

D. Rock Excavation

Remove rock and dispose of it as shown on the Plans or as directed by the Engineer. Transition any flattening of a cut slope already begun when rock is encountered to ensure the cut has a pleasing appearance.

Use the presplitting technique to reduce overbreakage and to establish a free surface or shear plane in the rock along the cut periphery or proposed break lines.

- Presplit a periphery plane to the excavation depth before blasting within the plane.
- Conduct the presplitting process by drilling appropriately sized holes at intervals that will ensure a neat break, to the desired depth, along the plane of the proposed cut. Load and stem the holes with an appropriate light charge explosive, and detonate the explosives simultaneously.
- Allow an 18 in. (450 mm) offset in the slope to begin succeeding drilling operations when the depth of the cut is more than can be drilled from the top.

Create a relatively smooth shear plane as indicated in the Plans with localized irregularities that do not exceed 2 ft (600 mm) behind or 1 ft (300 mm) in front (roadway side) of the plane surface.

Do not presplit slopes flatter than 1:1.

1. Overbreakage

Material that is excavated beyond or below the cross-section shown on the Plans or designated will be at the Contractor's expense, except unavoidable overbreakage in solid rock. The allowable overbreakage is a maximum of 2 ft (600 mm) below or outside the original template lines. Backfill to replace material removed below the limits specified at no expense to the Department.

2. Precautions

See Use of Explosives in Subsection 107.12.

3. Rock and Boulders

Handle rock and boulder excavation as follows:

- a. Excavate solid rock and boulders in the roadbed to at least 1 ft (300 mm) below the finished subgrade elevation and backfill the space to the correct grade with suitable subgrade material.
- b. Leave the side slopes of rock cuts with uniform faces whether or not the excavation is carried beyond the specified side slope.
- c. Remove loose rock on cut slopes immediately after blasting.

- d. Place stones, broken rock, and boulders found within the construction limits and not required for other construction, into embankment slopes when possible.
4. Ensure that sloped surfaces conform to the typical section shown on the Plans or to natural cleavage planes compatible with the typical section. Leave sloped surfaces safe and natural looking.

E. Unsuitable Material Excavation

The Engineer may require unsuitable material be removed from its location.

1. Remove material and backfill with properly compacted approved material.
2. Undercut material to the depth shown on the Plans or established by the Engineer in cut areas where the material is not suitable for subgrades or shoulders. Backfill the area with suitable material.
3. Excavate unsuitable material in roadway cuts and dispose of the material as directed by the Engineer.

The Department will not designate the unsuitable material excavation as a separate Pay Item unless specifically designated on the Plans, but will pay for it as “Roadway Excavation—Unclassified.”

F. Obliteration of Old Roads

Obliterate old roads or other areas by completing the following work as directed by the Engineer:

- Obliterate discontinued roads or other areas inside or outside the Project construction limits.
- Grade, scarify, plow, and harrow obliterated areas.

The Department will pay for excavation (other than that necessary for finishing and dressing) as “roadway excavation—unclassified.” Follow this procedure to obliterate the road:

1. Fill old ditches and grade the roadway after the old road is no longer needed for traffic. Restore the original contour of the ground and produce a surface of naturally rounded slopes.
2. Use borrow required for the new roadway from fills in the old road (where feasible).
3. Place surplus and waste material from the new roadway in cuts in the old road (where feasible).
4. Break down and remove or bury old structures not required to maintain drainage flow. Remove and store material with salvage value, or use it in the new construction.
5. Scarify, harrow, and smooth the old surface. Re-grass disturbed areas or establish a vegetative cover according to Section 160 or Section 700 as applicable.

G. Surcharge Removal

Remove and properly dispose of materials placed as surcharge for consolidation or other purposes.

1. Waste the material removed or use it for other purposes as specified on the Plans or in the Special Provisions.
2. Provide other areas for disposal if adequate areas are not available for disposing of excess surcharge within the Right-of-Way.

H. Use of Select Materials

Conserve and use excavated materials suitable for subgrade, shoulder construction, plant topsoil, blanket for fill slopes, or other purposes as directed by the Engineer according to Subsection 104.06.

1. Reserve suitable material by either leaving it in its original position or stockpiling it as directed by the Engineer.
2. Haul select materials directly from the excavation area to the final placement area whenever possible. Do not stockpile materials unless specifically directed.

The Department will again pay for “roadway excavation—unclassified,” which includes necessary hauling and placement, when the material is removed from the stockpile.

I. Final Finishing of Roadway

After excavation has been completed use the following procedure to finish the roadway:

1. Shape the surface of the roadbed and slopes to reasonably true grade alignment and cross-section shown on the Plans or established by the Engineer. Finish according to Section 209.
2. Leave cut slope surfaces in rock reasonably uniform and remove loose overhanging rock.
3. Open all ditches, drains, and culverts constructed to effectively drain the roadway.

The Department will make no separate payment for finishing done under this Section. Include the work in the cost of the roadway excavation.

4. Maintain the excavated areas until final acceptance of the Project.

205.3.06 Quality Acceptance

General Provisions 101 through 150.

205.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

205.4 Measurement

Original ground surface measurements will be obtained using conventional methods, photogrammetric means, or a combination of these methods. The Engineer will determine the method(s) and time when the measurements are to be taken for each Project.

The volume of Roadway Excavation-Unclassified, authorized and accepted by the Engineer, will be computed by the method of average end areas, or other acceptable means, using the original ground surface, the final ground surface, cross-section, or approved templates.

The final ground surface will be obtained from conventional field measurements, as-built templates, photogrammetric means, or a combination of these methods. The Engineer will determine the method(s) to be used on each Project.

The measurement will include:

- Overbreakage and slides in roadway excavation, unless they are caused by Contractor negligence
- Authorized excavation of rock or unsuitable material below template grade
- Material re-excavated from stockpiles and used in construction as directed by the Engineer
- Surcharge removal

Excavation outside of staked lines and slopes will never be measured for payment unless ordered or approved by the Engineer.

Ditch excavation will be measured as specified in paragraph one, above.

Retaining wall construction will be measured to the back and bottom of the select material backfill or footing as the Engineer determines. Any exception outside these lines by the Grading Contractor to provide stable slopes and positive drainage will not be measured and will be considered incidental to the work.

Filling or plugging abandoned wells will not be measured for payment but all costs shall be included in the price bid for Roadway Excavation when Item 205 is shown as a pay item. Otherwise all costs shall be included in the overall contract bid price.

Removing paving, aggregates, and ballasts will be measured and included in the computations for roadway excavation when Section 205 is shown as a pay item (unless those items are shown in the Plans as a separate pay item).

205.4.01 Limits

General Provisions 101 through 150.

205.5 Payment

Removing paving, aggregates, and ballast will be paid for at the Contract Price bid per cubic yard (meter) when Item 205 is shown as a Pay Item, unless the items are shown in the Plans as a separate Pay Item.

The Department will withhold a percentage of the progress payments for the estimated quantity of earthwork (not to exceed 5 percent) until final dressing, subgrade construction, and satisfactory disposal of unsuitable or surplus materials is completed. This percentage withheld shall be in addition to that specified in Subsection 109.07.

- The Contract Price per cubic yard (meter) for “roadway excavation—unclassified” will be paid for quantities of excavation Excavating, hauling, placing, and compacting excavated material.
- Removing, loading, hauling, stockpiling as designated, and sawing pavement when payment is included under Item 205.
- Pre-splitting rock, disposing of unsuitable or surplus materials, excavating, shaping, disposing of unsatisfactory excavated materials, maintaining ditches (except channel excavation specified in Section 204), constructing subgrades and shoulders, and finishing, dressing, and maintaining the work until Final Acceptance.

Payment will be made under:

Item No. 205	Unclassified excavation	Per cubic yard (meter)
--------------	-------------------------	------------------------

205.5.01 Adjustments

General Provisions 101 through 150.

Section 206—Borrow Excavation

206.1 General Description

This work includes:

- Excavating material from borrow areas or pits outside the Project Right-of-Way
- Hauling and using the material as required on the Plans or directed by the Engineer
- Stripping, excavating, and disposing of unsuitable material from borrow areas. See Subsection 107.22 and Subsection 107.23

206.1.01 Definitions

General Provisions 101 through 150.

206.1.02 Related References

A. Standard Specifications

- Section 106—Control of Materials
- Section 107—Legal Regulations and Responsibility to the Public
- Section 160—Reclamation of Material Pits and Waste Areas
- Section 201—Clearing and Grubbing Right-of-Way
- Section 202—Random Clearing and Grubbing
- Section 208—Embankments
- Section 209—Subgrade Construction

B. Referenced Documents

- Section 106 of the National Historical Preservation Act

206.1.03 Submittals

The Engineer’s approval of borrow pits will be subject to the requirements of Section 106 of the National Historical Preservation Act being fulfilled.

Give the Engineer sufficient notice to perform necessary investigations, measurements, staking, and actions required in Subsection 206.3.05.A.

Working in the pit before receiving the following approvals may result in rejection of the borrow pit without payment:

- Approval for environmental considerations and material acceptability
- Approval from pit investigation, cross sectioning, and staking

206.2 Materials

Perform work using embankment materials that meet the requirements in Section 208. Do not use material that contains roots or stumps. The Engineer will approve borrow excavation materials.

Use selected borrow of Class IIB3 or better when specified for subgrade construction or other uses (unless otherwise stated in the Plans or the Proposal).

206.2.01 Delivery, Storage, and Handling

Before obtaining material from borrow areas, use material to construct the embankment that is excavated from within the slope stakes, or stockpile the material for topping out the roadbed (unless otherwise directed by the Engineer).

206.3 Construction Requirements

206.3.01 Personnel

General Provisions 101 through 150.

206.3.02 Equipment

Ensure that equipment and methods used in borrow pits produce the following results:

- Various strata, pockets, or accumulations of different types of material are excavated and used in the correct proportions and sequence.
- Material is used to produce borrow or selected borrow with the best possible gradation and stability within the specified range.
- Material is excavated uniformly to facilitate measurement.

206.3.03 Preparation

General Provisions 101 through 150.

206.3.04 Fabrication

General Provisions 101 through 150.

206.3.05 Construction

A. General

The Department will investigate and take necessary actions to satisfy requirements of Section 106 of the National Historical Preservation Act.

B. Clearing and Grubbing

Clear and grub borrow pits as necessary before removing borrow material as specified in Section 106 and Section 202.

C. Draining Pits

Prevent water from standing in the pits unless the Engineer determines not to drain the pit.

Leave slopes presentable. Machine slope the bottom of the excavated area to smooth the surfaces suitable for revegetation.

The Department will not measure for payment ditch excavation for draining borrow pits. The bid price for borrow excavation shall include this work.

D. Disposing of Waste Material

Dispose of material unsuitable for embankments such as stone, broken rock, boulders, and other material found in the borrow pits.

1. Dispose of the material in a manner satisfactory to the Engineer and at no expense to the Department.
2. Do not leave piles of unsightly material in pits with or without the consent of the property owner.
3. Dispose of waste materials according to Subsection 201.3.05.E.

E. Reclamation

Leave borrow pits or waste disposal areas presentable. Reclaim them according to Section 160 unless exempted by Subsection 160.1.

Develop boundary slopes of reclaimed areas and grade them to 3:1 slopes or flatter.

206.3.06 Quality Acceptance

General Provisions 101 through 150.

206.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

206.4 Measurement

The quantity of borrow and selected borrow is measured in its original position by the method of average end areas or other acceptable means.

When designated in the Plans, selected borrow may be measured by volume of the hauling vehicle according to Section 109.

The following will have no payment:

- Material excavated before the original surface of the pit is obtained by the Engineer
- Materials excavated for maintaining the work
- Materials excavated that run out of the embankment on a flatter slope than indicated on the cross-section shown on the Plans or established by the Engineer
- Unsuitable material excavated from the borrow area and not used on the roadway

The Department will measure original and final ground surfaces by conventional field or photogrammetric or other methods, as determined by the Engineer.

206.4.01 Limits

General Provisions 101 through 150.

206.5 Payment

The provisions of Section 106 apply to borrow pits. The Department will not pay for the following:

- Delays caused by fulfilling the requirements of Section 106 or costs involved if the borrow pit is rejected
- Work done to provide or improve access or haul roads to borrow pits (except when specifically stated in the Proposal)

The prices bid for borrow excavation shall include this cost.

The quantities of borrow and selected borrow are measured as described in Subsection 206.4 and will be paid for at the Contract Price per cubic yard (meter). This is full compensation for excavating, hauling, placing, and compacting the material according to the Plans and Specifications and for draining and dressing the borrow area.

Borrow material furnished at no cost (no royalty) to the Contractor is “borrow excavation.”

If royalties must be paid for material shown on the Plans as a possible source of borrow, or if the source of borrow must be furnished, the Bid Item is “borrow excavation including material.”

The same criteria applies to selected borrow.

Payment will be made under:

Item No. 206	Borrow excavation	Per cubic yard (meter)
Item No. 206	Borrow excavation, including material	Per cubic yard (meter)
Item No. 206	Selected borrow excavation	Per cubic yard (meter)
Item No. 206	Selected borrow excavation, including material	Per cubic yard (meter)

206.5.01 Adjustments

General Provisions 101 through 150.

Section 207—Excavation and Backfill for Minor Structures

207.1 General Description

This work includes excavating, backfilling, or disposing of materials required to install a bridge culvert, box culvert, pipe, arch culvert, headwall and retaining wall according to the Specifications, the Plans, and the Engineer.

207.1.01 Definitions

General Provisions 101 through 150.

207.3.04 Fabrication

General Provisions 101 through 150.

207.3.05 Construction

A. Locations and Elevations

The Engineer will determine final locations and elevations of the structure. The locations and elevations shown on the Plans are approximate.

B. Excavation

The Engineer will determine the minimum requirements for length and depth of excavation for each structure. Assume the responsibility for the cost of installing necessary sheeting and bracing.

When excavating, follow these requirements:

- Excavate through rock or boulder formations to at least 1 ft (300 mm) below the bottom of the structure, except for where the entire concrete or masonry structure rests on solid rock.
- Backfill with Type I or Type II material to the proper subgrade elevation.
- As the embankment is constructed, excavate and place pipe on the new embankment. Pipe may be placed incrementally on steep gradients.
- Cut surfaces at structure trenches to prevent damage to the adjacent pavement when existing paved areas will be retained.
- Saw pavements deep enough to cause the edges to break in straight lines.
- Ensure that the width, depth, and vertical walls of an excavated imperfect trench conform to Plan details and dimensions within 2 in (50 mm).
- Dispose of surplus and unsuitable materials as directed by the Engineer.
- Consider excavated material as unclassified excavation according to Section 205, except that the Department will not pay for excavation for minor structures.
- Include the cost of fulfilling these requirements in the price bid for the pipe.

C. Backfill

Obtain backfill materials that meet the Specifications from sources approved by the Engineer.

1. Foundation Backfill Materials, Types I and II

Use the following materials as shown on the Plans or as directed by the Engineer:

- a. Use Type I material in dry structure trenches and Type II material in wet trenches.
- b. Use Type I material as a finishing course for Type II material when permitted by the Engineer.
- c. Backfill excavations beyond the specified limits with the same type of material required for the adjacent area; however, the Department will not measure excess backfill material for payment.
- d. Place Type I and Type II backfill material in layers of no more than 6 in (150 mm) loose.
- e. Compact each layer as follows:
 - 1) Type I Backfill Material: Compact to 95 percent of the theoretical dry density determined by GDT 7.
 - 2) Type II Backfill Material: Compact to a satisfactory uniform density as directed by the Engineer.

2. Imperfect Trench Backfill Material, Type III

Place this material as loose uncompacted backfill over pipe structures as shown on the Plans where imperfect trench backfill is specified.

3. Normal Backfill

Ensure that normal backfill material meets the requirements of Subsection 810.2.01, Class I or II. Class IIIC1 material may be used in Districts 6 and 7. Place and compact according to Section 208 except as follows:

- a. Do not place rock more than 4 inches (100 mm) in diameter within 2 ft (600 mm) of any drainage structure.
- b. For backfill behind retaining walls, use a pervious material that meets the requirements of Case I or Case II as follows:
 - 1) Case I. Case I refers to backfills for retaining walls that support roadbeds and parking areas.
Ensure that the backfill conforms to Section 208. Do not place rock more than 4 in (100 mm) in diameter within 2 ft (600 mm) of the retaining wall or finished surface.
 - 2) Case II. Case II refers to backfills for retaining walls that do not support roadbeds or parking areas.
Ensure that the backfill conforms to the requirements of Case I above, except compact the backfill to the density of the adjacent soil.

D. Pavement Replaced

Replace pavement removed at structure trenches in kind where adjacent pavements will be retained. An equal or better material may be used when approved by the Engineer.

Backfill and maintain a smooth riding surface until repaving is complete.

207.3.06 Quality Acceptance

General Provisions 101 through 150.

207.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

207.4 Measurement

A. Excavation

The following considerations are not measured for payment:

- Excavation for minor structures, including undercut for backfill materials as shown on the Plans

- Excavation for an imperfect trench which is required at locations specified in the Plans but which is not measured for payment
- Removal of water
- Removal of material from any area required to be reexcavated
- Excavation and backfill of temporary drainage ditches

B. Extra Depth Excavation

The following extra depth excavations are not measured for payment:

1. Extra depth excavation because of Contractor negligence
2. Extra depth excavation (required by the Engineer) below the original Plan elevation of the bottom of the footing or the flow line of a culvert pipe that does not exceed 3 ft (1 m)

If the Engineer relocates the structure or orders the elevation of the bottom of the footing or the flow line of the pipe to be lowered or undercut more than 3 ft (1 m), the Contractor will be compensated for the extra depth excavated below the 3 ft (1 m) limit according to Subsection 104.04 and Subsection 109.05.

Calculate the width of extra depth excavation using the diameter of the pipe or the width of the footing plus 2 ft (600 mm).

The length of extra depth excavation is equal to the length of that portion of the structure that is lowered more than 3 ft (1 m) below Plan elevation.

C. Backfill Materials Types I, II, and III

1. Types I and II

These materials (in place and accepted) are measured in cubic yards (meters) compacted.

Lateral measurements are confined to an area bounded by vertical planes lying not more than 1 ft (300 mm) outside of and parallel to the limits of the structure.

Length and depth measurements are confined to the dimensions of compacted material in place as specified by the Engineer. Materials placed outside the above limitations are not measured for payment.

2. Type III

The Department measures Type III material (complete, in place, and accepted) in cubic yards (meters).

Lateral measurements of Type III material are confined to an area bounded by vertical planes lying directly above the outside walls of the structure.

Longitudinal measurements are confined to the length of treatment installed as specified. Measurements of depth are the dimensions shown on the Plans or as directed.

D. Normal Backfill

This Item is not measured separately, but is included in the measurement of the Items of excavation from which normal backfill materials are obtained.

207.4.01 Limits

General Provisions 101 through 150.

207.5 Payment

A. Excavation for Minor Structures

This Item will not be paid for separately except as provided in Subsection 207.4.B.

Section 207-Excavation and Backfill for Minor Structures

B. Sheeting and Bracing

Sheeting and bracing will not be paid for separately unless these materials are left in place at the written direction of the Engineer. In this case, the Contractor will be paid at invoice cost plus 10 percent.

C. Backfill Materials

Backfill material Type I, (measured as shown in Subsection 207.4.C.1) will be paid for according to Section 205 or Section 206.

The Department will pay for Types II and III separately at the Contract Unit Price per cubic yard (meter). This payment is full compensation for furnishing the materials from sources inside or outside the right-of-way, loading, unloading, hauling, handling, placing, and compacting the material.

D. Normal Backfill

This Item will not be paid for directly but will be paid at the Unit Price for the applicable excavation item from which the normal backfill materials are obtained.

Payment will be made under:

Item No. 207	Foundation backfill material, type II	Per cubic yard (meter)
Item No. 207	Imperfect trench backfill material, type III	Per cubic yard (meter)

207.5.01 Adjustments

General Provisions 101 through 150.

Section 208—Embankments

208.1 General Description

This work includes placing embankments, backfilling structures, and constructing earth berms and surcharges with suitable material excavated under Section 204, Section 205, Section 206, and Section 207.

Complete the work according to the lines, grades, and typical cross- sections shown on the Plans or established by the Engineer.

The work also includes preparing areas by backfilling stump holes and correcting surface irregularities where the embankment is to be constructed. This includes forming, compacting, and maintaining the embankment and placing and compacting approved material where unsuitable material has been removed.

Payment for this work is included in other appropriate Pay Items unless a specific Pay Item is set up in the Contract.

Apply all provisions of Section 161 to the work in this Section.

Perform Shoulder Construction according to Section 216.

208.1.01 Definitions

General Provisions 101 through 150.

208.1.03 Submittals

General Provisions 101 through 150.

208.2 Materials

Embankment material classes are defined in Section 810, Section 811, and Section 813. The material incorporated into the roadway will be subject to the following limitations:

A. Embankment Material

Use embankment material classified as Class I, II, III, V, or VI except as noted below:

1. Inundated Embankments
A Special Provision in the Proposal will contain required gradation and other characteristics of materials for constructing embankments through reservoirs.
2. Intermittently Inundated Embankments
Build intermittently inundated embankments using any material suitable for embankment.
3. Embankments at Structures
Use Class I or II embankment materials within 10 ft (3 m) of any bridge structure. Class IIIC1 material may be used in Districts 6 and 7. Class IIIC2 or IIIC3 material may only be used in Districts 6 and 7 if approved by the Office of Materials, Geotechnical Engineering Bureau. Ensure that materials do not contain rock larger than 3 in (75 mm) for any dimensions.

B. Rock Embankment

Ensure that rock embankment placed as indicated on the Plans meets the requirements of Section 811 unless specified otherwise in the Plans or in the Special Provisions.

C. In-Place Embankment

Construct in-place embankment with Class I, II, III, V, or VI material.

D. Backfill Material

Use Class I or Class II backfill material furnished and stockpiled as defined in Subsection 810.2.01.A. Class IIIC1 material may be used in Districts 6 and 7. Class IIIC2 or IIIC3 material may only be used in Districts 6 and 7 if approved by the Office of Materials, Geotechnical Engineering Bureau.

E. Pond Sand Embankment

Use pond sand that meets the requirements of Section 813 as embankment material. Material is subject to the following approval limitations:

1. Pond sand will be approved on a stockpile basis only.
2. Pond Sand will not be approved for Type I or normal backfill materials or for backfill for mechanically stabilized walls.
3. Pond sand shall be encapsulated, when used as fill, with 2 ft (600 mm) of soil on the slopes and 3 ft (1 m) of soil on top.
4. Pond sand shall not be used on sidehill fills or fill widenings where any of the following conditions exist:
 - a. The proposed fill slope is steeper than 2:1.
 - b. The thickness of the proposed fill at its thinnest point, as measured perpendicularly from the new fill line to the existing ground slope/fill slope, is less than 7 ft (2.1 m), including 2 ft (600 mm) of soil cover.
 - c. The fill height exceeds 30 ft (9 m).

208.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

208.3 Construction Requirements

208.3.01 Personnel

General Provisions 101 through 150.

208.3.02 Equipment

General Provisions 101 through 150.

208.3.03 Preparation

General Provisions 101 through 150.

208.3.04 Fabrication

General Provisions 101 through 150.

208.3.05 Construction

A. Benching Excavation for Embankment

This work includes excavating material forming benches in the existing ground beneath proposed embankments. Form benches to increase the bond between the existing ground and the proposed embankment.

This work is required where embankments are placed on hillsides or against existing embankments, which will be indicated on the Plans.

Construct the benches approximately 12 ft (3.7 m) wide unless otherwise shown on the Plans. Use material removed in the excavation in the embankments. The Department will make no additional payment for this work.

B. Embankments

Follow these requirements when constructing embankments:

1. Preparation for Embankments

Before starting embankment construction, clear and grub the embankment area according to Section 201 and install Drainage Structures according to Section 550.

a. Depressions and Undercut Areas

Fill depressions below the ground surface and undercut areas with suitable material. Remove unsuitable or unstable material and compact according to Subsection 208.3.05.B.1.c before beginning embankment construction.

b. Scarification and Other Preparation

Plow and scarify the entire area upon which the embankment is to be placed (except inundated areas) at least 6 in (150 mm) deep.

Before placing the embankment, recompact loosened soil to the approximate density of the underlying soil. Cut benches as specified in Subsection 208.3.05.A.

c. Compaction Under Shallow Fills

When the depth of fill and surfacing is 3 ft (1 m) or less, compact the original ground compact at least 1 ft (300 mm) deep to at least 95 percent of the maximum laboratory dry density as determined from representative samples of the compacted material using GDT 7, GDT 24a, GDT 24b, or GDT 67 whichever applies.

The in-place density of the compacted fill will be determined according to GDT 20, GDT 21, or GDT 59, whichever applies.

d. Embankments Over Existing Roads, Parking Areas, and Floors

Thoroughly plow or scarify all portions of existing unpaved roads and flexible pavements. Destroy cleavage planes before placing the embankment.

1) Remove the old pavement with rigid surfaces if the new embankment is not more than 3 ft (1 m) high.

2) Break remaining rigid pavements that are within 10 ft (3 m) of the finished grade so that no section larger than 10 ft² (1 m²) remains intact.

2. Embankment Formation

Use the following requirements when constructing the embankment formation:

a. Layer Construction

Except as noted in Subsection 208.3.05.B.2.d, construct the embankments in parallel layers. Deposit the material and spread in horizontal layers not more than 8 in (200 mm) thick, loose measurement, for the full width of the cross-section. Use motor graders, bulldozers, or other approved equipment to keep layers uniform. Compact the layers using a sheepfoot roller. The Engineer may permit the use of vibratory rollers whenever the embankment soils consist of Class IA1, IA2, or IA3 materials.

b. Moisture Content

Compact each layer within the range of optimum moisture content to achieve the compaction specified below.

Do not construct successive layers on previous layers that exhibit excessive pumping under construction equipment regardless of compaction.

Dry material if it contains too much moisture. Ensure the moisture content is sufficient for stability and compaction.

Add water if the material is too dry and uniformly mix it with the soil for stability and compaction. The Department will not measure water added to the material under this requirement for payment. It is considered incidental to the satisfactory completion of the work.

c. Degree of Compaction

Compact the embankment at bridge structures to at least 100 percent of the maximum laboratory dry density. Compact for the full depth of the embankment, beginning at the toe of the slope and extending 100 ft (30 m) from the end of the bridge.

Compact embankment other than at bridge structures to at least 95 percent of the maximum laboratory dry density to within 1 ft (300 mm) of the top of the embankment. Compact the top 1 ft (300 mm) of the embankment to at least 100 percent of the maximum laboratory dry density.

If grading and paving are let in separate contracts, the paving Contractor shall recompact the top 6 in (150 mm) to at least 100 percent of the maximum laboratory density.

The maximum laboratory dry density will be determined from representative samples of the compacted material using GDT 7, GDT 24a, GDT 24b, or GDT 67, whichever applies. The in-place density of the compacted fill will be determined according to GDT 20, GDT 21, or GDT 59, whichever is applicable.

d. Special Conditions

Follow these special requirements:

- 1) Build layers as parallel as possible. In certain cases the Engineer may permit steeper slopes at ends of the embankments.
- 2) In swamp or inundated areas that will not support the equipment, build the lower part of the fill by dumping successive loads in layers no thicker than necessary to support the hauling equipment.
- 3) Build and compact the remainder of fills in layers as specified above.

e. Embankments at Structures

Use Class I or II material when constructing embankments over and around pipes, culverts, arches, and bridges according to Subsection 810.2.01.A.1. Class IIIC1 material may be used in Districts 6 and 7.

- 1) Compact the material as specified in Subsection 208.3.05.B.2.c.
- 2) Place the specified material on both sides of bridge structures for a distance of at least 10 ft (3 m).

NOTE: Do not place rock larger than 4 in (100 mm) diameter within 2 ft (600 mm) of any drainage structure.

Before any traffic is allowed over any structure, provide a sufficient depth of material over and around the structure to protect it from damage or displacement.

f. Method of Handling Classes of Soils

Handle the different classes of soils using the following methods:

1) Class IIB3 and Better Soils

Distribute and compact these soils in 8 in (200 mm) uniform layers over the entire width of the embankment. Use these soils (when available in sufficient quantities) in the top 1 ft (300 mm) of the roadbed. Reserve these soils for this purpose when directed by the Engineer.

2) Class IIB4 Soils

Distribute and compact these soils in 8 in (200 mm) layers over the entire width of the embankment. If Class IIB3 or better soils are available in borrow pits, use these soils in the top 12 inch (300 mm) of subgrade. Class IIB4 soils may be used in the top 12 inch (300 mm) of subgrade if approved by the Office of Materials, Geotechnical Engineering Bureau.

3) Class IIIC Soils

Class IIIC1 soils may be used in Districts 6 and 7 within the top 12 inch (300 mm) of subgrade if approved by the Office of Materials, Geotechnical Engineering Bureau. Do not use Class IIIC2, IIIC3 or IIIC4 soils within the top 12 inch (300 mm) of subgrade unless a stabilizing agent approved by the Engineer is added, or if approved by the Office of Materials, Geotechnical Engineering Bureau. Class IIIC4, chert clay soils in District 6 with less than 55 percent passing the No. 10 (2 mm) sieve may be used for subgrade.

4) Class IV Soils

Do not use these soils in embankments. Waste these soils or (when designated in the Plans or directed by the Engineer) stockpile them and use them for blanketing fill slopes.

5) Class V Soils

Place these soils in the same manner as Class IIB4 soils. Pulverize large particles to obtain the proper compaction.

6) Class VI Rock

Place rock in uniform layers not over 3 ft (1 m) thick and distribute it over the embankments to avoid pockets. Fill voids with finer material.

Do not place rock larger than 6 in (150 mm) in diameter within 3 ft (1 m) of the finished surface of the embankment.

Do not place rock larger than 6 in (150 mm) in diameter within 2 ft (600 mm) of the outer limits of proposed posts or utility poles.

Do not place rock at bridge end bents within 10 ft (3 m) of pile locations.

7) All Classes

Place mixtures of the above classes together with random material such as rock, gravel, sand, cinders, slag, and broken-up pavement so that coarse particles are dumped near the outer slopes and finer particles near the center of the roadway.

Produce a gradual transition from the center to the outside. If material is too large to place in 8 in (200 mm) layers, treat it as rock or break it down and place it in 8 in (200 mm) layers.

3. Embankment Consolidation at Bridge Ends

When consolidating embankments at bridge ends, use the following specifications:

- a. When a waiting period is required in the Plans or by Special Provision, place end fills at bridges in time for consolidation readings to indicate that both the fill and the natural ground have reached the desired degree of stability.
- b. Delay constructing bridge portions during the period of consolidation as shown on the Plans or as required by a Special Provision.

The Plans or the Special Provisions will indicate the estimated time required to reach consolidation.

The Engineer may extend or shorten this waiting period based on settlement readings taken on points placed in the fills. The longer or shorter waiting period will not constitute a valid claim for additional compensation.

Follow these specifications when extending a waiting period:

- 1) Extending an estimated waiting period may lead to increasing the Contract time. If the Contract is on a calendar day or completion date basis, the Department may increase the calendar days equal to the maximum number of calendar days involved in the extension.
 - 2) When a time extension causes additional delay due to seasonal changes, the Engineer may recompute the time extension on an available day basis.

When the Contract is on an available day basis, the time increase will be equal to the greatest number of available days involved in the extension.
 - 3) When time charges on separate Bridge Contracts are controlled by Special Provisions that set forth the availability of bridge sites, extending an estimated waiting period controls the availability of that bridge site only; time charges will be adjusted according to the Special Provision.
- c. Construct the embankment at bridge ends full-depth to the subgrade template (except for the stage construction providing a bench for the end bent) unless otherwise stated in the Plans and compact thoroughly before driving a piling at bridge ends.

The minimum acceptable length of completed full-depth embankment is equal to the maximum width of fill between slope stakes at the end of the bridge. The Department will measure the minimum length of full-depth embankment along the roadway centerline away from the end-of-bridge Station.

C. In-Place Embankment

Construct embankments designated on the Plans and in the Proposal as “In-Place Embankment” using either a hydraulic or conventional dry land construction method and using materials obtained from within the construction limits of the Right-of -Way or from borrow pits, whichever is appropriate.

Regardless of the method of construction, the Department will measure the entire embankment for payment as in-place embankment.

1. Construction

- Build embankments according to this Section when hydraulic or conventional dry land construction methods are used.
- Furnish equipment suitable for the method chosen to complete the work. Equipment is subject to the Engineer’s approval.
- When using a hydraulic method is used, conform to these additional requirements:
 - a. Using baffles for construction is permitted as long as the embankment slopes are not steeper than indicated on the Plans.
 - b. Use of excess material placed outside the prescribed slopes to raise the fill is permitted.
 - c. Leave openings in the embankments at the bridge site as indicated on the Plans.
Dredge material that invades the openings or existing channels at no additional expense to the Department. Provide the same depth of channel at mean low water as existed before the construction of the embankment.
 - d. Do not excavate or dredge material within 500 ft (150 m) of the toe of the embankment or existing structures, unless otherwise shown on the Plans.
 - e. Place in-place embankment in areas previously excavated below the ground line in a uniform mass beginning at one end of the excavated area and continuing to the other end of the operation. Avoid forming of muck cores in the embankment.
 - f. Construct the embankment at the farthest points along the roadway from the bridge ends and progress to the end of the excavation area beyond the toe of the slope of endrolls at bridge ends.
 - g. Remove timber used for temporary bulkheads or baffles from the embankment.
 - h. Fill and thoroughly compact the holes.

2. Maintenance

- a. Maintain the embankment at grade until it has been completed and accepted. Assume responsibility for slides, washouts, settlement, subsidence, or mishaps to the work while under construction.
- b. Keep constructed embankment stable and replace displaced portions before Final Acceptance of the entire Contract.
- c. Remove and dispose of excess materials, including fill, detours, and erosion deposits placed outside the prescribed slopes in wetland areas.

3. Permits

Obtain (at no additional expense to the Department) necessary permits or licenses from the appropriate authorities to operate dredges and other floating equipment in waters under their jurisdiction, unless otherwise provided for in the Contract.

4. Erosion Control

In addition to the provisions of Section 161, follow additional erosion, siltation, and pollution control measures specified in the Plans or Special Provisions.

D. Rock Embankment

This work includes furnishing materials either from the roadway excavation or other sources and hauling and the placing of rock embankment. Use materials that meet the requirements of Subsection 208.2.B, as shown on the Plans or directed by the Engineer.

1. Place the rock in uniform layers not over 3 ft (1 m) thick. Distribute rock over the embankment to avoid pockets.
2. Fill voids with rock fines. Do not use rock larger than 6 in (150 mm) for any diameter within 3 ft (1 m) of the finished grade of the embankment, or within 2 ft (600 m) of any structure.
3. Do not place rock at bridge end bents within 10 ft (3 m) of pile locations. Construct rock embankment and adjoining earth embankment concurrently. Ensure that neither is larger than 4 ft (1.2 m) higher than the other at any time.

E. Final Finishing

After constructing the entire embankment, shape the surface of the roadbed and the slopes to reasonably true grade and cross-sections as shown on the Plans or established by the Engineer.

Open ditches, channels, and drainage structures (both existing and those constructed or extended) to effectively drain the roadway. Maintain the embankment areas until Final Acceptance of the Project.

208.3.06 Quality Acceptance

General Provisions 101 through 150.

208.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

208.4 Measurement

The following section details measurement for payment for the work described in this Section:

- A. Except as provided herein, there will be no measurement for payment for the work covered by this Section.
- B. The Department will compute the quantity of in-place embankment or rock embankment using the average end area method, or other acceptable methods, when embankment is in place and accepted.

The quantity will be calculated as the neat volume, above the original ground surface, between the template line shown on the Plans or authorized changes by the Engineer, and the original ground surface.

The original ground surface is determined by conventional field, photogrammetric, or other methods. The Department will not deduct for the volume of culverts and manholes.

In-place embankment necessary for the construction of temporary detours will not be measured for payment and is considered incidental to the completion of the work unless specifically stated otherwise on the Plans.

Where work includes excavating of unstable materials below the ground line, the volume of embankment required for backfill below the ground line is calculated based on the neat line measurement for the cross-section shown on the Plans or established by the Engineer by the average end area method or other acceptable methods.

Where permitted by the Engineer or required by the Plans, material removed from the existing roadbed, special ditches, berm ditches, or dry land borrow pits and used in making embankment will be paid for as in-place embankment regardless of the method of excavation.

208.4.01 Limits

General Provisions 101 through 150.

208.5 Payment

Except as provided for herein, the Department will not make separate payment for placing embankments, backfilling structures, and constructing earth berms, including surcharges.

Payment will be included at the Contract Unit Price for the items covered by Section 204, Section 205, and Section 206. Prices are full compensation for The Work covered by this Section.

The Unit Prices bid per cubic yard (meter) for in-place and rock embankments (when included as Contract bid Items) are full compensation for furnishing suitable material, hauling, placing, compacting, finishing, and dressing according to these Specifications or as directed by the Engineer.

Payment will be made under:

Item No. 208	In-place embankment	Per cubic yard (meter)
Item No. 208	Rock embankment	Per cubic yard (meter)

208.5.01 Adjustments

General Provisions 101 through 150.

Section 209—Subgrade Construction

209.1 General Description

This work includes placing, mixing, compacting, and shaping the top 6 in (150 mm) or the Plan-indicated thickness of the roadbed in both excavation and embankment areas.

This work also includes subgrade stabilization, select material subgrade, and shoulder stabilization.

209.1.03 Submittals

General Provisions 101 through 150.

209.2 Materials

A. Subgrade Materials

If the Plans do not show the source of material for subgrade, the Engineer will direct the Contractor according to the Specifications, or implement a Supplemental Agreement to ensure a satisfactory subgrade.

If the existing roadway excavation or borrow materials are not suitable or available for stabilizing the subgrade, use the quantity of stabilizer materials defined below in Subsection 209.2.B.

B. Subgrade Stabilizer Materials

Material	Section
Type I Stabilizer Aggregate	803.2.01
Type II Stabilizer Aggregate	803.2.02

209.3 Construction Requirements

209.3.01 Personnel

General Provisions 101 through 150.

209.3.02 Equipment

General Provisions 101 through 150.

209.3.03 Preparation

General Provisions 101 through 150.

209.3.04 Fabrication

General Provisions 101 through 150.

209.3.05 Construction

A. Subgrade Construction

Construct subgrade as follows:

1. Plow, harrow, and mix the entire surface of the in-place subgrade to a depth of at least 6 in (150 mm).
2. After thoroughly mixing the material, bring the subgrade to Plan line and grade and compact it to 100 percent of the maximum laboratory dry density.
3. If the subgrade needs to be stabilized, or if a subsequent contract provides for base construction, do not apply density requirement at this stage.

If a subsequent Contract provides for base construction, eliminate mixing and compact the in-place subgrade to 95 percent of the laboratory maximum dry density.

4. Ensure that the subgrade can firmly support construction equipment before placing subsequent layers of base and paving materials. The subgrade must support construction equipment without excessive movement regardless of compaction.
5. Rework unstable areas of subgrade to a moisture content that will provide stability and compaction. The Engineer may direct the Contractor to proof roll the subgrade with a loaded dump truck.
6. Compact the subgrade using a sheepsfoot roller.
The Engineer may permit the use of vibratory rollers whenever the subgrade soils consist of Class Ia1, IA2, or IA3 materials.
7. Ensure that subgrade material used underneath soil-cement base meets the requirements of Subsection 301.3.03.A.

B. Subgrade Stabilization

Construct a stabilized subgrade according to Plans or as directed:

1. Undercut and dispose of the amount of subgrade material that will be displaced with the aggregate or selected material according to the Engineer's direction.
2. Leave material off the subgrade in fill sections requiring stabilization.
3. Place the amount of material specified in Subsection 209.2.B. on the subgrade as specified on the Plans or established by the Engineer.
4. Thoroughly incorporate the material into the existing subgrade to a depth of 6 in (150 mm), or as indicated on the Plans. Plow, disk, harrow, blade, and then mix with rotary tillers until the mixture is uniform and homogeneous throughout the depth to be stabilized.
5. Finish the stabilized subgrade to the Plan line, grade, and cross-section. Compact it to 100 percent of the maximum laboratory dry density as defined in Subsection 209.3.06.
Plant mixing is permitted as an alternative to the mixed-in-place method.
6. Eliminate the mixing and scarifying method before compaction in undercut areas where Type III Stabilizer Aggregates are specified, unless otherwise specified by the Engineer.

C. Select Materials Subgrade

Place select materials as follows:

1. Construct the subgrade with a uniform blanket of select material consisting of Class I or II soil or graded aggregate (according to Plan dimensions or as directed by the Engineer). Class IIC1 soils may be used in Districts 6 and 7 within the top 12 inch (300 mm) of subgrade if approved by the Office of Materials, Geotechnical Engineering Bureau. Do not use Class IIC2, IIC3 or IIC4 soils within the top 12" (300mm) of subgrade unless a stabilizing

agent approved by the Engineer is added, or if approved by the Office of Materials, Geotechnical Engineering Bureau.

2. Use the select material reserved from the grading or borrow operations. If material is not available through this source, obtain it from other sources.
3. Finish and compact the material according to Subsection 209.3.05.A.

D. Shoulder Stabilization

Stabilize the shoulder as follows:

1. Spread the stabilizer aggregate at the rate and to the dimensions indicated on the Plans.
2. Mix the aggregate with the in-place shoulder material thoroughly to the Plan depth.
3. Compact the area thoroughly and finish it to Plan dimensions.
4. Prime the stabilized area according to Section 412 when a paving course is required on the shoulders.

E. Finishing Subgrade

When finishing subgrade use the following procedure:

1. Leave the underlying subgrade in cuts and fills low enough to accommodate the additional material when the work requires either subgrade stabilization, select material subgrade, or stabilization for shoulders.
2. Test short sections in curb and gutter areas might be necessary to obtain the proper elevation.
3. Blade the surface of the completed subgrade to a smooth and uniform texture.

209.3.06 Quality Acceptance

The Department will test representative samples of compacted material to determine the laboratory maximum dry density using GDT 7, GDT 24a, or GDT 67 as applicable.

The Department will determine in-place density of the compacted subgrade according to GDT 20, GDT 21, or GDT 59, as applicable.

Ensure that the centerline profile conforms to the established elevations with an acceptable tolerance of ± 0.5 in (± 13 mm). The acceptable tolerance under a template conforming to the designated cross section shall be ± 0.25 in (± 6 mm).

Have the Department test the maximum dry density using methods according to Subsection 209.3.05.A. When base construction is not in the same Contract, the tolerances may be 1 in (25 mm), 0.5 in (13 mm), and 95 percent respectively.

209.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

209.4 Measurement

A. Subgrade Construction and Finishing Subgrade

The Department will make no separate measurement or payment for the work described in this Section.

B. Subgrade Stabilization

Subgrade stabilization materials, as defined in Subsection 209.3.05.B is measured by the ton (megagram), cubic yard (meter), or square yard (meter) of the specified thickness if none of the existing Roadway Excavation and/or Borrow Materials are suitable and available for stabilizing the subgrade.

C. Select Material Subgrade

Select materials, conforming to Subsection 209.3.05.C are measured by the cubic yard (meter) in the hauling vehicle, per ton (megagram) according to Subsection 109.01, or by the square yard (meter) of the specified thickness when roadway excavation and/or borrow materials are not available or suitable for this Item.

D. Shoulder Stabilization

Shoulder stabilization is measured by the cubic yard (meter) or ton (megagram) as specified in Subsection 209.4.B.

209.4.01 Limits

General Provisions 101 through 150.

209.5 Payment

A. Subgrade Construction

The Department will make no separate payment for subgrade construction or for finishing subgrade.

B. Subgrade Stabilization

Subgrade stabilization complete and accepted according to Subsection 209.3.05.B will be paid for at the Contract Unit Price per cubic yard (meter), per ton (megagram), or per square yard (meter). This price is full compensation for furnishing the materials, hauling, placing, mixing, compacting, and finishing the stabilized subgrade.

C. Select Material Subgrade

Select material complete, accepted, and measured according to Subsection 209.4.C will be paid for at the Contract Unit Price per cubic yard (meter), per ton (megagram), or per square yard (meter). This price is full compensation for furnishing the material where required, hauling, placing, mixing, compacting and finishing the select material subgrade.

D. Shoulder Stabilization

This Item will be measured by Subsection 209.4.B. and paid for according to Subsection 209.5.B. This Item also includes furnishing and applying bituminous prime.

Payment will be made under:

Item No. 209	Stabilizer materials (class), (type), (thickness)	Per ton (megagram), cubic yard (meter), or square yard (meter)
Item No. 209	Select material subgrade (class), (type), (thickness)	Per ton (megagram), cubic yard (meter), or square yard (meter)
Item No. 209	Stabilizer aggregate for shoulders	Per ton (megagram), or cubic yard (meter)

209.5.01 Adjustments

General Provisions 101 through 150.

Section 210—Grading Complete

210.1 General Description

This work includes:

- Excavating of all materials including ditches, undesirable material (including removal and replacement), and borrow (if required)
- Hauling
- Forming embankments
- Constructing shoulders and subgrades
- Finishing, dressing, and disposing of undesirable or surplus material
- Clearing and grubbing according to Section 201 and Section 202 unless these items are established as Pay Items in the Contract
- Removing and disposing of miscellaneous roadway items, including but not limited to curbs, drainage structures, and pavements (unless established as separate contract items)

Ensure that the completed grading work conforms to the horizontal and vertical alignment and typical cross- sections shown on the Plans or as directed by the Engineer.

210.1.01 Definitions

General Provisions 101 through 150.

210.1.02 Related References

A. Standard Specifications

Section 109—Measurement and Payment

Section 201—Clearing and Grubbing Right-of-Way

Section 202—Random Clearing and Grubbing

Section 204—Channel Excavation

Section 205—Roadway Excavation

Section 206—Borrow Excavation

Section 207—Excavation and Backfill for Minor Structures

Section 208—Embankments

Section 209—Subgrade Construction

B. Referenced Documents

General Provisions 101 through 150.

210.1.03 Submittals

General Provisions 101 through 150.

210.2 Materials

Use materials required for grading construction that conform to the requirements of Section 204, Section 205, Section 206, Section 207, Section 208, and Section 209.

210.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

210.3 Construction Requirements

210.3.01 Personnel

General Provisions 101 through 150.

210.3.02 Equipment

Use equipment approved by the Engineer that will not damage base, pavement, or other appurtenances to be retained.

210.3.03 Preparation

Before placing base material, finish the subgrade according to Subsection 209.3.05.E.

210.3.04 Fabrication

General Provisions 101 through 150.

210.3.05 Construction

Perform The Work according to the appropriate portions of Section 201, Section 202, Section 204, Section 205, Section 206, Section 207, Section 208, and Section 209 of the Specifications. Measurement and payment shall be according to the provisions of this Section. See Subsection 210.4 and Subsection 210.5, below.

210.3.06 Quality Acceptance

When the Engineer determines that the existing material in areas where fills are to be placed is undesirable, the Engineer may require the Contractor to remove the undesirable material and replace it with suitable material.

- Compact the replacement materials according to the applicable portions of Section 208.
- In cut areas, where the material below the template line is undesirable for subgrade or shoulders, undercut it to a depth established by the Engineer and replace it with suitable material.
- Compact the replacement materials as specified herein.

210.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

210.4 Measurement

A. Grading Complete

The Work under this Item is not measured separately for payment.

B. Grading Per Mile (Kilometer)

This Item is measured in linear miles (kilometers) along the centerline of the road or the median, including ramps where shown on the Plans.

C. Undercut Excavation

The amount of undercut excavation (when directed by the Engineer and not addressed in the Plans) measured for payment is the product of the length, width, and depth of excavation. Replacement material for undercut excavation is not measured for payment. There will be no separate payment for undercut excavation required by the Plans or rock excavation required under Subsection 205.3.

210.4.01 Limits

General Provisions 101 through 150.

210.5 Payment

A. Grading Complete

This Item completed and accepted will be paid for at the Lump Sum Price bid. Payment is full compensation for all work and materials specified in this Section.

B. Grading Per Mile (Kilometer)

This Item will be paid for at the Contract Unit Price per linear mile (kilometer) complete in place and accepted. This price is full compensation for furnishing the materials and performing the work specified in this Section.

C. Undercut Excavation

Undercutting areas not shown in the Plans when directed by the Engineer will be paid for at the rate of \$7.50 per cubic yard (\$9.80 per cubic meter) for quantities up to 750 yd³ (575 m³).

Quantities exceeding 750 yd³ (575 m³) will be considered Extra Work as defined in Subsection 109.05, and will be paid for accordingly. Payment is full compensation for excavating and disposing of undesirable material and supplying, placing, and compacting replacement material.

Payment will be made under:

Item No. 210	Grading complete	Per lump sum
Item No. 210	Grading per mile (kilometer)	Per mile (kilometer)
Item No. 210	Undercut excavation	Per cubic yard (meter)

210.5.01 Adjustments

General Provisions 101 through 150.

Section 211—Bridge Excavation and Backfill

211.1 General Description

This work includes the following responsibilities:

- Removing materials necessary for the construction of bridge footings and substructures
- Disposing of excess materials and required backfilling, including porous backfill
- Constructing and removing work bridges, cribs, cofferdams, and caissons
- Dewatering, draining, sheeting, and exploratory boring of foundations necessary to complete the work

Excavate and backfill concrete box culverts as specified in Section 207.

211.1.01 Definitions

Foundation: Material on which the footing of the substructure or seal rests.

211.1.02 Related References

A. Standard Specifications

Section 201—Clearing and Grubbing Right-of-Way

Section 207—Excavation and Backfill for Minor Structures

Section 500—Concrete Structures

Section 525—Cofferdams

Section 540—Removal of Existing Bridge

B. Referenced Documents

General Provisions 101 through 150.

211.2 Materials**211.2.01 Delivery, Storage, and Handling****A. Surplus Materials**

Dispose of surplus, stockpiled, and excavated materials as directed by the Engineer. Materials may be spread neatly and smoothly on the right-of-way so as not to obstruct the channel of any existing or proposed waterway. Dispose of wasted materials according to Subsection 201.3.05.E.

211.3 Construction Requirements**211.3.01 Personnel**

General Provisions 101 through 150.

211.3.02 Equipment**A. Cofferdams and Sheeting**

Use necessary protection such as cofferdams and sheeting when working in or near excavations where the surrounding earth could fail and endanger personnel or damage the work.

Use cofferdams or sheeting to prevent undesirable changes in channels and slopes.

Construct, remove, and dispose of cofferdams according to Section 525, regardless of whether they are measured separately for payment.

211.3.03 Preparation**A. Preparation of Foundations**

Prepare and maintain foundations as follows:

1. Do not subject concrete to the action of water before final setting, except as provided for seal concrete in Subsection 500.3.05.V.
2. Where footings are placed on a slightly sloped foundation of rock or hardpan, key the center of the foundation approximately 1 ft (300 mm) deep throughout an area approximately equal to the dimensions of the column to be placed (unless the Plans require entire footing to be keyed).
3. When the Engineer requires, step the foundation and remove all loose fragments and clean and fill seams as directed.
4. Do not disturb the top of the foundation to ensure that footings are placed on undisturbed material when they are not resting on rock or hardpan foundations.

211.3.04 Fabrication

General Provisions 101 through 150.

211.3.05 Construction

A. Foundations and Footings

The sizes and elevations shown on the Plans are approximate, and are subject to change when directed.

B. Inspection

Provide the Engineer ample opportunity and safe conditions (as determined by the Engineer) to inspect foundations and measure removed materials. Do not place concrete or close foundation areas from view until the area has been inspected and approved.

C. Boring of Foundations and Seals

Bore foundations as requested and in an approved manner so that the foundation's adequacy can be determined by the Engineer. Borings are usually required only for foundations and seals with no piles. All borings shall be made in the Engineer's presence.

Bore to at least 6 ft (1.8 m) deep in rock and 10 ft (3 m) deep in other material, excluding seals. The entire depth of the seal will usually be bored in only one location.

D. Backfill Construction

Follow these requirements when backfilling:

1. General

Backfilling is a part of the work of excavation, except as noted.

- a. Place the backfill in layers not exceeding 1 ft (300 mm) of loose material. Compact the layer before placing the next layer.

Backfill around all substructures except those located within the banks of a stream at normal water level.

- b. Do not jet backfills.
- c. Place backfill material to apply only balanced horizontal loads to a newly placed structure or portion of structure.

Do not backfill portions of structures that do not have backfill on all sides until the concrete has reached the required strength (as determined by the Engineer) to withstand the earth pressures.

2. Intermediate Bents and Piers

Compact backfill for intermediate bents and piers to the approximate density of the surrounding soil.

- a. Begin and complete backfilling around substructures not supported by piling the next workday after placing the lift, if possible. Backfill at least within three calendar days after placement.
- b. Backfill footings before beginning form work on the columns.
- c. Begin backfilling around pile-supported footings and columns after removing forms. Complete as soon as possible but within five calendar days after placing concrete.

3. End Bents and Abutments

Compact backfill for end bents and abutments (including their wingwalls) to the density shown on the Standard Plans or Special Plans.

- a. Begin and complete the work no later than five calendar days after placing concrete, unless other time limits are indicated on the Plans.

If other time limits are indicated, this work may be second stage construction or second stage backfill construction.

- b. Step slopes behind abutments, unless otherwise shown, and take precautions to prevent the backfill from wedging against the abutment.
- c. Provide drainage behind abutments and their wingwalls as shown on the Plans.
- d. Place backfill for abutment footings and portions of walls having fill on both sides of the wall according to Subsection 211.3.05.D.4.

4. Backfill Material

Backfill around intermediate bents and piers with material removed from the excavation, unless the material is unsatisfactory to the Engineer.

- a. Ensure that material for end bents and abutments meets the requirements shown on the Standard Plans or Special Plans.

When suitable material is not available within the immediate vicinity of the bridge within the right-of-way, locate a source acceptable to the Engineer and haul the material to the site.

- b. Obtain and place backfill material necessary for end bent and abutment construction, including special backfill material used in constructing mechanically stabilized earth wall abutments.
- c. Ensure that material located and hauled to the bridge site meets the requirements of Class I, Class II, or as shown in Subsection 810.2.01.A.1, unless otherwise noted. Class IIIC1 material may be used in Districts 6 and 7.
- d. Ensure that porous backfill (when specified) consists of coarse aggregate size No. 57 as specified in Subsection 800.2.01, or crushed stone drainage material as specified in Subsection 806.2.02.A.

211.3.06 Quality Acceptance

General Provisions 101 through 150.

211.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

211.4 Measurement

A. Bridge Excavation

Bridge excavation is measured for payment as follows:

- Bridge excavation is measured in cubic yards (meters) of bridge excavation acceptably removed.
- No payment is made for materials removed outside the area bounded by vertical planes a maximum of 18 in (450 mm) outside of and parallel to the neat lines of the footings, unless otherwise shown on the Plans.
- No separate measurement is made under the Item of bridge excavation for excavation necessary for end bent construction unless otherwise shown on the Plans.
- Portions of structures removed under Section 540 that fall within the excavation limits are not included in the measurements for bridge excavation.
- The vertical pay dimension is measured from the original ground line. However, for grade separation structures, the vertical pay dimension is measured from the subgrade template of the roadway passing underneath, unless otherwise shown on the Plans.
- The vertical pay dimension for excavation at an intermediate bent (constructed within the limits of a previously placed end roll) includes the portion of the end roll that falls within the excavation limits.
- Each portion of a stepped footing is considered a separate footing (for measurement purposes).
- The bottom of each footing or step will be cross-sectioned by the Engineer (to obtain the elevation of the completed excavation).

B. Bridge Backfill

Bridge backfill is measured for payment as follows:

- No separate measurement is made for bridge backfill.
- Backfill material hauled to intermediate substructure locations according to Subsection 211.3.05.D.4. is not measured as bridge backfill, but is considered a Specification Allowance as set forth in Subsection 211.5.B.
- No allowance is made for material hauled in for use at bridge ends.

211.4.01 Limits

General Provisions 101 through 150.

211.5 Payment

A. Bridge Excavation

This work will be paid for at the Contract Price per cubic yard (meter) complete, or at the Contract Price modified as specified below:

1. The Department will pay for all eligible excavation down to 2 ft (600 mm) below the Plan foundation elevation at the Contract Price for bridge excavation.
2. The amount of payment for excavating lower than 2 ft (600 mm) below the Plan elevation is determined by increasing the Contract Price for bridge excavation as follows:
 - a. If excavations extend 6 ft (1.8 m) or less below the Plan foundation elevation, payment for excavating the material from 2 ft (600 mm) below the Plan foundation elevation is at the Contract Price plus 50 percent.
 - b. If excavations extend more than 6 ft (1.8 m) but not more than 10 ft (3 m), payment for excavating the material from 2 ft (600 mm) below the Plan Foundation elevation is at the Contract Price plus 75 percent.
 - c. If excavations extend more than 10 ft (3 m) below the Plan foundation elevation, payment for excavating the material from 2 ft (600 mm) below the Plan foundation is at the Contract Price plus 100 percent.

B. Bridge Backfill

The Department will not pay for this work separately. Include the cost in other pay items included in the Bridge Contract.

The Department will pay 125 percent of the Contract Price for bridge excavation when the Contractor furnishes and hauls material used as replacement for unsuitable material excavated at intermediate substructure locations. Maximum dimensions and deductions are specified in Subsection 211.4.B.

Payment will be made under:

Item No. 211	Bridge excavation	Per cubic yard (meter)
Item No. 211	Bridge excavation grade separation	Per cubic yard (meter)
Item No. 211	Bridge excavation, stream crossing— no.____	Per cubic yard (meter)
Item No. 211	Porous backfill	Per cubic yard (meter)

211.5.01 Adjustments

General Provisions 101 through 150.

Section 212—Granular Embankment

212.1 General Description

This work includes furnishing, hauling, and placing granular material for constructing or reconstructing of the embankment according to the Plans.

212.1.01 Definitions

General Provisions 101 through 150.

212.1.02 Related References

A. Standard Specifications

Section 109—Measurement and Payment

Section 810—Roadway Materials

B. Related Documents

General Provisions 101 through 150.

212.1.03 Submittals

General Provisions 101 through 150.

212.2 Materials

Ensure that granular material meets the requirements of Class I-A-2 soil, Subsection 810.2.01.A, modified as follows:

Percent Passing No. 200 (75 µm)	0 to 18
Percent Clay	0 to 10

212.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

212.3 Construction Requirements

212.3.01 Personnel

General Provisions 101 through 150.

212.3.02 Equipment

General Provisions 101 through 150.

212.3.03 Preparation

General Provisions 101 through 150.

212.3.04 Fabrication

General Provisions 101 through 150.

212.3.05 Construction

Follow these requirements when constructing a granular embankment:

1. Place the embankment at the location(s) shown on the Plans.
2. Ensure that thickness of the lifts and the compaction are approved by the Engineer.

3. When granular embankment material is placed under water, place the granular material on dry ground above the high-water level then push the material toward and into the water according to the limits and dimensions shown on the Plans.

212.3.06 Quality Acceptance

General Provisions 101 through 150.

212.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

212.4 Measurement

Furnished granular embankment material complete in place and accepted, is measured by volume according to the following cases:

A. Pit with Multiple Party Access

When granular embankment material is obtained from a pit from which multiple parties have access, the granular embankment is measured by volume in the hauling vehicle as specified in Subsection 109.01.

B. Pit with Exclusive Access

When granular embankment material is obtained from a pit dedicated exclusively to the Project on which payment for granular embankment is being made, the granular embankment is measured for payment using the average end area method to determine the volume of material removed from the pit and incorporated into The Work.

C. Quarry

When granular embankment material is obtained from a quarry, a certified weight ticket shall accompany the material. The weight of the material delivered and accepted is converted to an equivalent volume based on the dry loose unit weight of the material provided.

212.4.01 Limits

General Provisions 101 through 150.

212.5 Payment

Granular embankment material will be paid for at the Contract Price per cubic yard (meter). This price is full compensation for furnishing material, hauling, placing, compacting, and providing labor, equipment, and superintendence necessary to complete The Work.

Payment will be made under:

Item No. 212	Granular embankment, including material and haul	Per cubic yard (meter)
--------------	--	------------------------

212.5.01 Adjustments

General Provisions 101 through 150.

Section 213-Sand Backfill

213.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 214—Mitigation Site Construction

214.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 215—Removal of Solid Waste

215.1 General Description

This work includes excavating, removing, and disposing of solid waste discovered during construction or shown on the Plans. Remove materials according to this Specification, Plan details, and as directed by the Engineer.

215.1.01 Definitions

Solid Waste: Discarded putrescible (i.e. liable to rot) and non-putrescible wastes such as trash, garbage, animal carcasses, debris, and materials not natural to the area.

215.1.02 Related References

A. Standard Specifications

Section 107—Legal Regulations and Responsibility to the Public

Section 109—Measurement and Payment

Section 208—Embankments

B. Referenced Documents

QPL 64

215.1.03 Submittals

Submit a report of disposal from the municipal solid waste landfill to the Engineer for each load of solid waste removed from the project.

215.2 Materials

Handle hazardous materials according to Subsection 107.22, “Hazardous and/or Toxic Waste.”

A. Soil Cover Materials

Soil materials used to cover exposed areas of a removal site may be any noncontaminated earth material approved by the Engineer.

B. Odor Control Chemicals

Acceptable odor control chemicals used for solid waste removal are listed on the Georgia Department of Transportation QPL 64. Similar or equal chemicals may be substituted when approved by the Engineer.

215.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

215.3 Construction Requirements

215.3.01 Personnel

General Provisions 101 through 150.

215.3.02 Equipment

General Provisions 101 through 150.

215.3.03 Preparation

General Provisions 101 through 150.

215.3.04 Fabrication

General Provisions 101 through 150.

215.3.05 Construction

A. Worker Protection

Provide effective engineering and work practice controls to protect employee health and safety.

B. Applicable Specifications

Perform this work according to this Specification and strictly comply with federal, state, or local codes or ordinances pertaining to removing solid waste.

Verify the accuracy and existence of applicable codes, ordinances, or other regulations by obtaining and interpreting state, county, city, or local municipality by-laws for solid waste disposal.

C. Site Information

The Department will make available existing boring logs of sites shown on the Plans. Prospective bidders can obtain this information by contacting the Geotechnical Engineering Bureau of the Office of Materials at (404) 363-7549.

D. Site Categories

Solid waste removal sites are designated as “Shown on the Plans” or “Discovered during Construction” for the purpose of this Specification.

E. Removal and Disposal Procedures

Remove and dispose of solid waste using these requirements:

1. Sites Shown on the Plans

Work with solid waste sites shown on the Plans according to these requirements:

- a. Give the Engineer two weeks notice before removing solid waste.
The Engineer will notify the local governing authority of the proposed work and tentative time schedules.
- b. After beginning to excavate solid waste, give the work constant attention.
Excavate the material to the full depth and width of the cut in one continuous operation, leaving minimum exposed surface.
- c. Leave working faces of the cut as near vertical as possible. However, slope them enough to safely place a layer of soil over the exposed areas.
- d. Transport solid waste to a permitted municipal solid waste landfill. Obtain a listing of permitted municipal solid waste landfills by contacting the Georgia Environmental Protection Division, Land Protection Compliance Program at (404) 362-2696.
- e. Obtain permission for disposal from the landfill. You must have the Engineer’s approval of the disposal site.
- f. Fill trucks hauling material from the removal site to less than full capacity to prevent spills.

Completely cover the truck body with a waterproof tarpaulin, large enough to extend over the sides and end of the bed to secure the material in transit. Fasten the tarpaulin securely.

- g. At the end of each day's work, cover exposed areas of the removal site with a 6 in (150 mm) layer of clean earth. Include the cost of this work in the overall bid submitted.
 - h. Spray odor control chemicals on the exposed solid waste and on hauling vehicles as outlined in Subsection 215.3.05.F, "Odor Control."
 - i. When directed by the Engineer, overexcavate the area based on the conditions of the solid waste site during removal. Overexcavation is measured and paid for according to Subsection 215.4, "Measurement" and Subsection 215.5, "Payment."
 - j. When removal is complete, backfill solid waste areas according to the embankment construction requirements in Section 208. Include the cost of this work in the applicable bid prices for unclassified and borrow.
2. Solid Waste Sites Discovered During Construction
- Control solid waste sites discovered during construction by following these requirements:
- a. Report solid waste sites discovered during construction to the Engineer, immediately. Stop work in the vicinity until the Engineer determines an appropriate Plan for removal and payment.
 - b. Conduct Work approved by the Engineer under the provisions of Subsection 109.05, "Extra Work."
 - c. Remove, dispose of, and backfill according to this Specification and Subsection 107.22, "Hazardous and/or Toxic Waste."

F. Odor Control

Control objectionable odors from the exposed solid waste at the removal site and on haul trucks in transit as follows:

- 1. Use an effective odor control chemical selected from QPL 64, or an approved equivalent.
The Engineer will cooperate with the local governing authority to determine the acceptability of the odor control chemical, the application concentration, and the application frequency in the removal area and on the hauling vehicles.
- 2. Keep available a minimum three-day supply of odor control chemical to treat the solid waste during removal operations. During the last three days of removal, the Engineer may allow the odor chemical inventory be reduced to save expenses.
Include the cost of spray material, labor, and equipment necessary to control objectionable odors in the overall bid submitted.

215.3.06 Quality Acceptance

General Provisions 101 through 150.

215.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

215.4 Measurement

The work performed under this item is measured as follows:

A. Sites Shown on the Plans

Removing solid waste from sites shown on the Plans is measured by the cubic yard (meter).

The volume of material measured for payment will be based on cross-section measurements using the average end area method.

Excavating outside the neat lines shown on the Plans is not measured for payment unless the work is directed and authorized by the Engineer.

B. Sites Discovered during Construction

Work for solid waste removal sites discovered during construction is measured according to Subsection 109.05, "Extra Work."

C. Overexcavation of Solid Waste

Overexcavating solid waste to depths below those shown on the Plans is measured by the cubic yard (meter). Volume calculations are described in Subsection 215.4.A, "Sites Shown on the Plans."

215.5 Payment

Work performed under this Item will be paid for as follows:

A. Sites Shown on the Plans

Removing solid waste from sites shown on the Plans will be paid for at the Contract Unit Price bid per cubic yard (meter). This is full compensation for excavating the solid waste material; hauling and properly disposing of the hazardous materials; closing the remaining landfill site; constructing necessary haul roads; furnishing chemicals and spraying the removal site, trucks, and contents as required; disposing at a permitted municipal solid waste landfill; and providing fencing, labor, equipment, tools, direction, and incidentals necessary to complete the Item.

B. Sites Discovered during Construction

Removing solid waste from sites discovered during construction will be paid for according to Subsection 109.05.

C. Overexcavation of Solid Waste

When the Engineer requires removal of solid waste beyond the limits shown on the Plans, payment for removal and disposal will be as follows:

1. Solid waste removed from within the neat cross sections shown on the Plans, and to the depth of 3 ft (1 m) below those cross sections, will be paid for at the Unit Price bid per cubic yard (meter) for removing solid waste.
2. Solid waste removed to depths below the 3 ft (1 m) specified above will be paid for as follows:
 - a. Over 3 ft (1 m) but not over 10 ft (3 m) deep:
This material will be paid for at the rate of 110 percent of the Unit Price bid per cubic yard (meter) for that portion of the material over 3 ft (1 m) but not over 10 ft (3 m) of extra depth.
 - b. More than 10 ft (3 m) deep:
If the extra depth exceeds 10 ft (3 m), stop work in that area. The Engineer will request an investigation by the Office of Materials.
If necessary to excavate below the 10 ft (3 m) level, do not resume work until a satisfactory plan for payment has been established.

Payment will be made under:

Item No. 215	Removal of solid waste	Per cubic yard (meter)
--------------	------------------------	------------------------

215.5.01 Adjustments

General Provisions 101 through 150.

Section 216—Unpaved Shoulders

216.1 General Description

This work includes constructing unpaved shoulders.

216.1.01 Definitions

General Provisions 101 through 150.

216.1.02 Related References

A. Standard Specifications

GDT 24a

GDT 59

GDT 67

216.1.03 Submittals

General Provisions 101 through 150.

216.2 Materials

Unless otherwise specified in the Proposal, ensure that the material conforms to Section 817. The provisions of Section 106 apply to shoulder materials obtained from sources off the Right-of-Way.

216.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

216.3 Construction Requirements

216.3.01 Personnel

General Provisions 101 through 150.

216.3.02 Equipment

Before beginning shoulder construction, have the required equipment on the Project and in good working condition. Use equipment approved by the Engineer. The Engineer will not permit tractors with treads or equipment that damage existing base, surfacing, or pavement.

216.3.03 Preparation

General Provisions 101 through 150.

216.3.04 Fabrication

General Provisions 101 through 150.

216.3.05 Construction

A. General

Shape and compact shoulders in sequence as required for the type of base or pavement being constructed. Promptly repair damage to an existing base, surface, or pavement due to shoulder construction. Repairs are to be made at no expense to the Department.

B. Compaction

Immediately compact shoulders as follows to reduce erosion:

1. Grassed Shoulders

Compact shoulder areas above subgrade elevation that require grassing or sodding to a firm and stable condition as determined by the Engineer.

2. Ungrassed Shoulders

Ensure that ungrassed shoulder areas (including ungrassed stabilized shoulders and paved shoulders) have a resultant density of at least 100 percent of the maximum laboratory dry density. The density is determined from compacted representative samples of the material using GDT 7, GDT 67, or GDT 24a, whichever applies. The in-place density of the compacted shoulder will be determined according to GDT 20, GDT 21, or GDT 59, whichever applies.

3. All Shoulders

Compact shoulders adjacent to a flexible base at least 18 in (450 mm) wider on each side along with the base course.

C. Maintenance

Maintain shoulders as follows:

1. Cut weep holes through shoulders constructed prior to flexible bases to prevent impoundment of water on the road-bed or subgrade.
2. Provide adequate temporary drainage facilities to prevent excessive erosion when front slopes are subject to concentrated water at weep holes.
3. Promptly repair excessive erosion to prevent damage to the adjacent base or pavement.
4. Repair and dress adjacent slopes and remove excess material from adjacent ditches when shaping, dressing, and compacting shoulders.

D. Construction Sequence

Construct unpaved shoulders as follows:

1. Portland Cement Concrete Bases and Pavements

Construct, shape, and compact the shoulders as soon as the curing period is complete on each section.

2. Hot Mix Asphaltic Concrete Pavement

Construct shoulders adjacent to hot mix asphaltic concrete pavement according to the following case scenarios:

a. Hot Mix Asphaltic Concrete Bases

Construct, shape, and compact the shoulders as soon as the final rolling is complete on each section.

b. Hot Mix Asphaltic Concrete Intermediate and Surface Courses

Place the shoulder material for the underlying base course and compact it before beginning the intermediate or surface course. Place, shape, and compact the remaining shoulder material after completing the final rolling of each section of surface course.

3. Flexible Bases or Pavements (except those listed under Subsection 216.3.05.D.2.a and Subsection 216.3.05.D.2.b)

Follow these requirements except when constructing shoulders and base courses of the same materials:

- a. Before constructing the base or pavement, place loose shoulder material to construct the compacted width of shoulder shown on the Plans.
Place the loose shoulder material at a proper distance outside the proposed edge of base or pavement.
- b. After initially manipulating and compacting the base or paving material, use the blade grader to pull the shoulder up to, but not inside of, the proposed edge of the base or pavement.
- c. When constructing multiple courses, construct the shoulders, base, or pavement using the same number of courses. Prevent excessive erosion from concentrated water at weep holes by keeping the distance from the base or pavement construction to the shoulder construction to a minimum. Move smoothly and efficiently between the two operations.

4. Stabilized Shoulders

When the Plans or Proposal call for stabilized shoulders, add the stabilizer according to the Specification pertaining to that Item.

5. Shoulders Constructed with Base Material

When constructing shoulders and base courses out of the same materials, place and construct the shoulder material in the same way as the base material.

6. Shoulders Constructed under Traffic

When constructing shoulders on highways that are open to traffic, use the following construction operations:

a. Removing Existing Shoulder Materials

Do not remove existing shoulders or portions of existing shoulders more than 1,500 ft (450 m) ahead of paving operations. Also, comply with this limitation when constructing new shoulders and paving is not involved.

b. Constructing Shoulders

Complete and compact shoulders within a distance of 1,500 ft (450 m) or less behind finished paving operations.

c. Enforcing Construction Limitations

When trenching out or rebuilding the shoulders on opposite sides of the pavement simultaneously, separate the two operations by at least 1 mile (1600 m), leaving at least one usable shoulder to protect passing traffic.

216.3.06 Quality Acceptance

General Provisions 101 through 150.

216.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

216.4 Measurement

A. Materials Obtained from Roadbed

Shoulders constructed from material obtained from adjacent portions of the roadbed are measured according to Subsection 205.4, "Measurement" or Subsection 210.4, "Measurement," as applicable.

B. Shoulders Adjacent to Stabilized Bases

When bases are constructed by stabilizing the existing roadbed, and the shoulders are to be bladed into section using materials from the existing roadbed, no measurement of shoulder materials will be made.

C. Shoulders Constructed with New Base Course Materials

New shoulders constructed of the same material as the new base course by spreading the base course material full width of the roadbed is measured for payment according to the appropriate Specification for the type base course.

D. Shoulders Constructed with Selected Shoulder Material

Selected shoulder material, including accepted pervious and impervious shoulder material obtained from pits or other sources off the Right-of-Way, is measured in cubic yards (meters) loose volume in vehicles when dumping.

216.4.01 Limits

General Provisions 101 through 150.

216.5 Payment

A. Shoulders Constructed with Materials Obtained from Existing Roadbed

Measured shoulder material obtained from the existing roadbed will be paid at the Contract Unit Price per cubic yard (meter) for Section 205.

Shoulders constructed out of existing roadway materials including selected borrow already in position from prior construction operations, will not be paid for separately. Payment for these materials will be made under the pertinent items required to place these materials in position.

B. Shoulders Constructed with New Base Course Materials

Shoulders constructed from new base course materials will be paid for according to the appropriate Specifications for the type of base course.

C. Shoulders Constructed with Selected Shoulder Material

Selected shoulder material, including accepted pervious and impervious shoulder material obtained from pits or other sources off the Right-of-Way, will be paid for at the Contract Unit Price per cubic yard (meter) or square yard (meter) of a specified thickness. Payment is full compensation for furnishing the material when specified and for performing construction, compaction, and other work specified in this Section pertaining to the Item.

If under the provisions of Section 106 the Contractor shall pay royalties for the selected shoulder material, the Pay Item is listed with the words “Including Material” added.

Payment will be made under:

Item No. 216	Selected material for shoulder construction	Per cubic yard (meter) or square yard (meter), ___ in (mm) average thickness
Item No. 216	Selected material for shoulder construction including material	Per cubic yard (meter) or square yard (meter), ___ in (mm) average thickness

216.5.01 Adjustments

General Provisions 101 through 150.

Section 217—Removal of Underground Storage Tanks

217.1 General Description

This work includes excavating, removing, and disposing of underground storage tank (UST) systems discovered during construction or shown on the Plans.

Remove materials according to this Specification, Plan details, and as directed by the Engineer.

217.1.01 Definitions

Underground storage tank system: A tank with at least 10 percent of its volume underground, including the pipes and pumps connected to the tank. The tanks may be used to store petroleum products or hazardous chemicals. Tanks used for the following are specifically excluded from Georgia EPD Rules (Chapter 391-3-15) and EPA regulation 40 CFR Part 280:

- Farm or residential tanks of 1100 gal (4160 L) or less capacity used for storing motor fuel for noncommercial uses
- Tanks used for storing heating oil for consumptive use of the premises where stored
- Pipeline facilities

Remove tanks excluded from Georgia EPD Rules (Chapter 391-3-15) and EPA regulation 40 CFR Part 280 according to the American Petroleum Institute's Recommended Practice 1604 (API 1604).

217.1.02 Related References

A. Standard Specifications

Section 109—Measurement and Payment

Section 208—Embankments

B. Referenced Documents

Georgia EPD Rules (Chapter 391-3-15)

EPA regulation 40 CFR Part 280

American Petroleum Institute's Recommended Practice 1604 (API 1604)

217.1.03 Submittals

A. UST Systems Shown on the Plans

Submit documentation of proper disposal to the Engineer no later than the day following disposal.

Submit the soil or water samples to a laboratory approved by the Engineer for testing.

Submit to the Engineer a completed test report, sketch, and certification that the tests were performed according to EPD rules. Submit the documentation within 30 days after the date the samples were taken.

217.2 Materials

A. Soil Backfill

To backfill a UST removal site, use earth materials approved by the Engineer.

B. Hazardous Materials

Handle materials classified as hazardous according to Subsection 107.22, "Hazardous and/or Toxic Waste."

217.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

217.3 Construction Requirements

217.3.01 Personnel

General Provisions 101 through 150.

217.3.02 Equipment

General Provisions 101 through 150.

217.3.03 Preparation

Two weeks before working on UST systems shown in the Plans, notify the Engineer in writing. The Engineer will inspect the work with the Office of Materials and the District's UST Tank Pull Inspector.

When the Engineer grants approval to proceed and the UST Tank Pull Inspector is present onsite to monitor the UST removal, proceed with the work according to the requirements outlined in Subsection 217.3.05.A, "Applicable Specifications."

217.3.04 Fabrication

General Provisions 101 through 150.

217.3.05 Construction

A. Applicable Specifications

Remove and dispose of UST systems according to the American Petroleum Institute's Recommended Practice 1604 (API 1604), Georgia EPD Rules (Chapter 391-3-15), and EPA regulation 40 CFR Part 280.

In addition to these requirements, strictly comply with Federal, State, or local codes or ordinances pertaining to removing UST systems.

Verify the accuracy and existence of applicable codes, ordinances, and other regulations by obtaining and interpreting state, county, city, or local municipality by-laws for solid waste disposal.

B. UST Categories

For this Specification, UST systems are categorized as those shown on the Plans or discovered during construction.

1. UST Systems Shown on the Plans

- a. Consider UST systems shown on the Plans as a normal part of the Contract.
- b. Assume liability for improperly removing and disposing of UST systems. Prevent spilling the contents of the tank and carefully handle and transport the tank to the permitted disposal area.
Immediately contain any spills and remove and dispose of the contaminated soil at no cost to the Department.
If the Engineer determines that the Contractor is negligent in containing and remediating spills, the Department will hire outside forces to perform the work and deduct the cost from the Contractor's payments.
- c. Dispose of the tank, contents, and contaminated soils according to EPD rules.
- d. After removing the tank and its contents, take soil samples as specified in the EPD rules and sketch the location and depth from which the samples were taken.
- e. If soils in the tank pit are visually contaminated, remove the soils through additional excavation (over-excavation).
Over-excavate to the limits of contamination or a maximum of 4 ft. (1.2 m) deep, whichever occurs first. After completing over-excavation, take soil samples as specified above.
If water is present in the pit after removing tank or over-excavating, take a water sample.

- f. Submit the soil and/or water samples to a laboratory approved by the Engineer for testing. Give the Engineer a complete test report and certification that the tests were performed according to EPD rules.
 - g. Place and compact backfill material for tank pit areas within the construction limits according to Section 208. Tank pit areas on the right-of-way outside the construction limits will not require any special placement procedure or compaction testing. Leave the area level, smooth, and dressed to the satisfaction of the Engineer.
2. UST Systems Discovered During Construction
- If a UST system is discovered during construction, notify the Engineer immediately.
- a. Stop work in the vicinity of the UST until arrangements for removal and disposal have been made.
 - b. Upon the Engineer's approval to proceed, perform the work according to Subsection 217.3.05.A and Subsection 217.3.05.B.1.b.

217.3.06 Quality Acceptance

General Provisions 101 through 150.

217.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

217.4 Measurement

The work performed under this Item is measured as follows:

A. UST Shown on Plans

UST systems shown on the Plans are measured on a per each basis.

B. UST Discovered during Construction

Work for UST systems discovered during construction is measured according to Subsection 109.05.

C. Over-excavation of Contaminated Soil

Over-excavation of contaminated soil for UST systems shown on the Plans is measured by the cubic yard (meter).

The volume of material measured for payment is the difference in the tank pit volume based on neat line plan dimensions minus the volume of the completed excavation area as determined from cross sections, using the average end area method.

Excavation outside Plan dimensions or dimensions established by the Engineer will not be measured for payment. Disposal of contaminated soil is not measured separately.

217.4.01 Limits

General Provisions 101 through 150.

217.5 Payment

Work performed under this Item will be paid as follows:

A. UST Shown on Plans

UST systems shown on the Plans and removed under this Item will be paid for at the Contract Unit Price per each.

Payment is full compensation for excavating, testing, hauling, and handling according to Georgia Environmental Protection Division Rules, as well as backfilling, compacting, fencing, and removing and disposing of contaminated soil, tank, tank contents, and all other incidentals necessary to complete the work.

B. UST Discovered During Construction

Removing UST systems discovered during construction will be paid for according to Subsection 109.05.

C. Over-excavation of Contaminated Soil

Over-excavating contaminated soil will be paid for at the Contract Unit Price per cubic yard (meter). Payment is full compensation for removing, hauling, properly disposing, backfilling, and compacting.

Payment will be made under:

Item No. 217	Removal of underground storage tank, station No. _____	Per each
Item No. 217	Over-excavation of contaminated soil	Per cubic yard (meter)

217.5.01 Adjustment

General Provisions 101 through 150.

Section 218—Blanket for Fill Slopes

218.1 General Description

This work includes placing a blanket material on fill slopes as shown on the Plans.

218.1.01 Definitions

General Provisions 101 through 150.

218.1.02 Related References

A. Standard Specifications

Section 893—Miscellaneous Planting Materials

B. Referenced Documents

General Provisions 101 through 150.

218.1.03 Submittals

General Provisions 101 through 150.

218.2 Materials

Use blanket material that meets the requirements on the Plans or in the Special Provisions. Ensure that plant topsoil meets the requirements of Subsection 893.2.01.

218.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

218.3 Construction Requirements

218.3.01 Personnel

General Provisions 101 through 150.

General Provisions 101 through 150.

218.3.03 Preparation

General Provisions 101 through 150.

218.3.04 Fabrication

General Provisions 101 through 150.

218.3.05 Construction

A. Remove Vegetation, Roots, and Trash

Remove vegetation, roots, trash, or materials that hinder the preparation of a proper bed for grassing as a part of this Item.

B. Plant Topsoil

To reduce plant topsoil loss from erosion, place the soil shortly before and in conjunction with grassing operations, unless otherwise directed. After placing material, replace material lost from erosion at no additional expense to the Department.

218.3.06 Quality Acceptance

General Provisions 101 through 150.

218.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

218.4 Measurement

The quantity of material placed and accepted under this Item is measured in cubic yards (meters), loose measure, in the vehicles at the point of dumping.

218.4.01 Limits

General Provisions 101 through 150.

218.5 Payment

Payment will be made under:

Item No. 218	Blanket for fill slopes	Per cubic yard (meter)
--------------	-------------------------	------------------------

218.5.01 Adjustment

General Provisions 101 through 150.

Section 219—Crushed Aggregate Subbase

219.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 221—Special Subgrade Compaction and Test Rolling

221.1 General Description

This work includes rolling subgrades using a special roller described in this Section and repairing weak places discovered during rolling.

The Item does not take the place of compaction or subgrade improvement specified elsewhere in the Specifications. It consists of the following complete operations:

- Test rolling and performing final compaction and preparation of the finished subgrade using special rolling and compaction equipment
- Replacing or repairing weak areas that develop in the finished subgrade from manipulating the test rolling equipment
- Continuing test rolling to compact repaired areas until the entire subgrade remains firm
- Protecting culverts and bridges from damage according to specified construction methods

221.1.01 Definitions

General Provisions 101 through 150.

221.1.02 Related References

General Provisions 101 through 150.

221.1.03 Submittals

221.2 Materials

General Provisions 101 through 150.

221.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

221.3 Construction Requirements

221.3.01 Personnel

General Provisions 101 through 150.

221.3.02 Equipment

Use the following equipment for special subgrade compaction and test rolling. Do not vary from these Specifications except by written permission from the Engineer.

A. Roller

Use a pneumatic-tired roller with these features:

- Single-axle base with four wheels
- Gross weight adjustable from 35 to 50 tons (31 to 45 Mg) as determined by the Engineer
- Wheels constructed to allow free rocking and oscillation
- Roller no more than 10 ft (3 m) wide overall with a turning radius of 15 ft (4.5 m) or less

Have a separate tractor unit pull the roller unless a self-propelled roller meets all of these requirements.

Use 18:00 x 25 tires inflated to the pressure recommended by the manufacturer for the wheel load but to not less than 90 psi (620 kPa).

Section 221-Special Subgrade Compaction and Test Rolling

Ensure that the gross contact area (entire surface of the tire on a flat surface) is no more than 331 in² (0.213 m²) per tire and the net contact area (treads) is no more than 166 in² (0.107 m²) per tire.

221.3.03 Preparation

Prepare the surface to be test rolled to the proper grade and cross-section. Ensure the top 8 in (200 mm) of the surface is within 3 percentage points of the optimum moisture content when rolling.

221.3.04 Fabrication

General Provisions 101 through 150.

221.3.05 Construction

A. Subgrade Preparation

When required, stabilize in the specified areas according to the Specifications before test rolling.

B. Extent of Rolling

Test roll on all portions of the subgrade under the proposed base, subbase, or pavement, plus a 2 ft (600 mm) width on each side. Exclude ramps servicing private property.

1. Roll frontage roads, spur connections, crossovers, and intersections according to the same requirements. The cost of rolling is considered incidental to the Item.
2. Test roll parallel to the centerline, with the forward speed of the roller between 2 and 5 miles (3 and 8 km) per hour.
3. Roll one outer edge then the other outer edge. Progress uniformly toward the center section until passing over the entire surface area at least twice.
4. Roll the entire width in segments long enough so that each segment takes about half a day.
5. Stop rolling during extreme moisture. If the moisture content of the subgrade is deficient, correct it by adding water.
6. Roll in the presence of the Engineer, who will mark the extent of weak areas and depressions immediately.

C. Repairs to Subgrade

Repair depressions and weak spots discovered while rolling.

1. The repairs may consist of removing unsatisfactory materials, replacing them with satisfactory materials, and strengthening or stabilizing the materials in place.
2. The Engineer will decide what repairs to make. Place and compact materials in the roadbed as specified for embankment or subgrades, whichever is appropriate.
3. Test roll again after making the repairs until the repaired areas are satisfactory according to these Specifications.

D. Test Rolling at Structures

Protect structures and prevent damage to them. Repair or replace damage caused by the test rolling at no expense to the Department.

1. Bridges

Do not allow the rolling unit within 10 ft (3 m) of bridge ends or bridge approach slabs.

Do not allow the rolling unit to cross a bridge on its own wheels when the unit's weight exceeds 23,000 lbs (10 433 kg) for a 1-axle loading.

2. Culvert Type Structures

When a culvert type structure falls within the limits of the test rolling area and the finished surface of the subgrade is less than 4 ft (1.2 m) above the exterior of the structure, do not allow the rolling unit within 10 ft (3 m) of the structure. Do not allow the rolling unit to cross any portion of the structure, except by one of the following methods selected by the Contractor.

Follow these protection methods. Assume responsibility for damage to a structure.

Section 221-Special Subgrade Compaction and Test Rolling

- a. Detour the rolling unit off the roadway and around the structure to the opposite side where rolling is resumed.
- b. Transport the rolling unit across the structure if the gross weight of the loaded transporting unit does not exceed 23,000 lbs (10 433 kg) for a 1-axle loading.
- c. Construct an embankment ramp over the structure to provide a minimum cover of 4 ft (1.2 m) over the top. The ramp must extend to the same elevation on each side for a minimum distance of 10 ft (3 m) from its exterior.
Place and remove the ramp at no expense to the Department.

221.3.06 Quality Acceptance

General Provisions 101 through 150.

221.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

221.4 Measurement

A. Test Rolling

Special subgrade compaction and test rolling is measured in miles (kilometers) along the center of the road—excluding bridges (regardless of the width and number of lanes to be rolled).

Frontage roads, spur connections, crossovers, and intersecting roads (including their ramp connections) falling within the right-of-way and within the limits of the Project are included in the overall length of the roadway shown for the Item, or included in the distance for any portion specified on the Plans.

B. Repairs to Subgrade

Materials removed under this Specification, regardless of their nature, are measured for payment according to Section 205 as Unclassified Excavation.

If the moved materials are laid aside or stockpiled and later used again, excavating these materials and placing them in the roadbed is measured for payment as Unclassified Excavation.

If new materials are required, they will be measured and paid for at the Unit Price bid for the materials according to Section 205 or Section 209, as applicable.

221.4.01 Limits

General Provisions 101 through 150.

221.5 Payment

A. Test Rolling

Special subgrade compaction and test rolling will be paid for at the Unit Price bid per mile (kilometer) completed and accepted. Payment is full compensation for preparing the surface, transporting the roller, moving the roller across or around prohibited areas, rolling as specified, watering, and providing incidentals necessary to complete the Item.

No separate payment will be made for protecting structures. Include the cost in the Unit Price bid for special subgrade compaction and test rolling.

B. Repairs to Subgrade

Payment for repaired subgrades will be according to Section 205 and Section 209, where applicable.

Payment will be made under:

Item No. 221	Special subgrade compaction and test rolling	Per mile (kilometer)
--------------	--	----------------------

221.5.01 Adjustment

General Provisions 101 through 150.

Section 222—Aggregate Drainage Courses

222.1 General Description

This work includes installing aggregate drainage courses. The drainage courses shall conform to the Specifications and to the lines, grades, and dimensions shown on the Plans or directed by the Engineer.

222.1.01 Definitions

General Provisions 101 through 150.

222.1.02 Related References

A. Standard Specifications

Section 109—Measurement and Payment

Section 806—Aggregate for Drainage

B. Referenced Documents

General Provisions 101 through 150.

222.1.03 Submittals

General Provisions 101 through 150.

222.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Subsection
Type I Aggregate Drainage Course	806.2.01
Type II Aggregate Drainage Course	806.2.02
Type III Drainage Blanket Material	806.2.03

222.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

222.3 Construction Requirements

222.3.01 Personnel

General Provisions 101 through 150.

222.3.02 Equipment

A. Embankment or Subgrades

To spread a uniform layer of coarse or fine aggregate without segregation and compact it to the specified requirements, use hauling and spreading equipment approved by the Engineer.

B. Other Surfaces

On any other surface, including wet and unstable areas, use trucks for end-dumping, and bulldozers and road machines for spreading.

222.3.03 Preparation

General Provisions 101 through 150.

222.3.04 Fabrication

General Provisions 101 through 150.

222.3.05 Construction

Construct the roadbed according to the lines, grades, and typical cross-sections shown on the Plans and according to Section 208 and Section 209.

Use coarse aggregate, drainage course, and drainage blanket material as follows:

Type I Aggregate Drainage Course	Use in a trench around pipe or in the shoulder in conjunction with a trench.
Type II Aggregate Drainage Course	Use as a drainage blanket under sidewalks, curbs and gutter, and beneath the pavement system or shoulders.
Type III Drainage Blanket Material	Use on parts of the roadway shown on the Plans as requiring a drainage blanket.

A. Prepared Embankments or Subgrades

1. Place the Material

Spread the material uniformly to obtain the compacted depth required on the Plans and as follows:

- a. The maximum thickness of each course is 6 in (150 mm) compacted, except as noted in Subsection 222.3.02.B, "Other Surfaces."
- b. If installing an underdrain system immediately under or adjacent to the aggregate drainage course, connect the drainage course directly to the underdrain system.
- c. After placing the pavement, make the subbase outside of the pavement flush with the outside pavement edge. Do not cut cement-stabilized subbase—keep it in place.
- d. When necessary, cover a shoulder drainage course with a second layer of shoulder pavement to prevent contaminating the aggregate drainage material.

2. Compact the Material

Compact the material according to the following procedures, and have the Engineer approve it.

- a. Unless specified otherwise by the Engineer, begin rolling on the outer edge of the drainage course and progress toward the center. On super-elevated curves or shoulders, begin rolling on the lower edge and progress toward the higher edge.
- b. For a Type II aggregate drainage course, roll when the moisture content of the material is at or near the optimum moisture.
- c. Roll until the surfaces of each layer are uniformly compacted.
- d. Compact the final layer with a steel wheel roller weighing no less than 10 tons (9 Mg) or a vibratory roller approved by the Engineer.
- e. If a layer is deficient in required thickness by more than 3/4 in (19 mm), scarify the surface and add more material to the thin area. Compact again according to the Specifications.

B. Other Surfaces

1. Prepare the Area

- a. Before placing drainage material, excavate or trench low areas for positive drainage as directed by the Engineer.

- b. Excavate trenches and undercutting to the dimensions and grades indicated on the Plans.
- 2. Drain the Area
Drain unstable or wet areas when the area is in the subgrade or the original ground surface is an embankment area or a trench. Spread drainage material to the requirements on the Plans or as directed by the Engineer.
- 3. Compact the Material
Compact drainage material until stable.

222.3.06 Quality Assurance

General Provisions 101 through 150.

222.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

222.4 Measurement

Aggregate drainage course is measured by the ton (megagram) or cubic yard (meter). When measured by the ton (megagram), the weight is determined by approved truck scales at the job site, or by other scales approved in advance. When measured by the cubic yard (meter), the loose volume is determined as specified in Section 109.

222.4.01 Limits

General Provisions 101 through 150.

222.5 Payment

Aggregate drainage course of the type specified will be paid for at the Contract Unit Price per ton (megagram) or per cubic yard (meter).

Payment will be made under:

Item No. 222	Aggregate Drainage Course, Type _____	Per ton (megagram)
Item No. 222	Aggregate Drainage Course, Type _____	Per cubic yard (meter).
Item No. 573	Underdrain Pipe including Drainage Aggregate _____ in(mm)	Per linear foot (meter)

222.5.01 Adjustments

If the average thickness for any 1-mile (1600 m) increment exceeds the specified thickness by more than 1 in (25 mm), the Department will reduce the Contractor’s payment for the excess material. The Department will calculate the excess material by multiplying how much average thickness exceeded the allowable 1 in (25 mm) tolerance by the surface area of the course.

Section 225—Soil-Lime Construction

225.1 General Description

This work includes preparing and treating roadbed materials with lime to form a base, subbase, or subgrade.

Water, mix, shape, and compact the necessary material according to these requirements and with the lines, grades, and thickness indicated on the Plans.

Lime treated roadbed materials, subbases, or bases will be designated as Class A, Class B, or Class C.

The requirements of these Specifications are applicable to each course or layer, unless otherwise indicated on the Plans.

GDT 20

GDT 21

GDT 42

GDT 59

225.1.03 Submittals

General Provisions 101 through 150.

225.2 Materials

Ensure that the soil is suitable for lime stabilization and that the materials used for stabilization meet the following requirements:

Soil	Section 810 or Section 814, as applicable
Water	Subsection 880.2.01

Lime	Subsection 882.2.02
Bituminous prime	Subsection 821.2.01
Blotter material (sand)	Subsection 412.3.05.G.3

A. Soil

Use soil that consists of materials found in the roadbed, base, subbase, or added materials as specified or directed by the Engineer. Ensure that these materials meet the requirements shown on the Plans or the pertinent Specifications for these items.

Remove the following from the soil:

- Particles of aggregate too large to pass through a 3 in (75 mm) sieve
- Roots, stumps, grass turfs, and other vegetable matter

B. Water

Use water without detrimental quantities of oil, salt, acid, alkalis, sugar, or vegetable matter. Do not use water with total inorganic solids exceeding 0.20 percent. Test non-potable water prior to use and provide test results to the Engineer. Do not begin construction until the Engineer has approved the test results.

Test according to Subsection 880.2.01.

C. Lime

The application rate for lime will be determined from laboratory tests and provided to the Contractor prior to beginning stabilization work. Hydrated lime will be used in all tests.

D. Bituminous Prime

Use bituminous prime that consists of cutback asphalt of the following grades:

- RC-30
- RC-70
- RC-250
- MC-30
- MC-70
- MC-250

E. Blotter Material

Use blotter material (sand) that meets the requirements of Section 412.

225.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

225.3 Construction Requirements

225.3.01 Personnel

Ensure that adequate protection and safety equipment and training is provided for all personnel.

225.3.02 Equipment

A. General Equipment

Use equipment of the right size, in satisfactory mechanical condition that can produce satisfactory results. Provide a list of proposed equipment to the Engineer prior to the beginning of construction. Provide any necessary equipment, including:

- Mechanical spreaders capable of uniformly distributing bulk lime or lime slurry to the actual application rate as shown in the Plans. Do not distribute dry lime by pneumatic pressure.
- Equipment capable of continuously mixing materials to a homogeneous blend and to a consistent depth. Weight all rollers sufficiently to accomplish the required compaction.
- Rotary-type soil mixers capable of mixing to a minimum depth of 12 inches (300 mm) and capable of injecting mix water directly into the mixing chamber with automatic sensors to monitor water application and mixing depth.
- Equipment for applying water and prime. Use a type and weight of equipment that will not damage lime-treated soil.

Do not begin construction until the Engineer has approved the proposed equipment.

B. Alternate Equipment

Alternate equipment, such as continuous or batch-type central plant or traveling mixing plants, will be approved if the equipment produces a mixture that meets this Specification.

225.3.03 Preparation

A. Prepare for Soil-Lime Construction

Prepare for soil-lime construction as follows:

1. Grade and shape the underlying foundation to the required lines, grades, and cross-section.
2. Compact the foundation to the required density specified in Subsection 225.3.05.F, "Compact Lime Layer" and Subsection 225.3.06.B, "Finishing Requirements."
3. Dry the foundation if necessary.
4. Ensure that the foundation is firm and can support the construction and compaction equipment without displacement.
5. Stabilize any soft or yielding material. If necessary, repeat this step (at no additional cost to the Department) before placing each subsequent layer.
6. Scarify and partially pulverize each layer of material to be treated to the necessary depth.
7. Remove all detrimental material from the soil according to Subsection 225.2, "Materials."

B. Test Section

The first section of each mixing operation will be a test section. The length of the test section will be the length required to use all of the lime on one truck.

Demonstrate the acceptability of the equipment and methods used and provide a standard by which to ensure the finished grade elevation and compacted thickness with this method.

1. If necessary, change the equipment, methods, or initial grade elevations based on results of the test section.
2. If changes in methods or equipment are made during the Project, construct additional test sections when directed by the Engineer.

225.3.04 Fabrication

General Provisions 101 through 150.

225.3.05 Construction

Lime-treated roadbed materials, subbases, or bases will be designated as Class A, B, or C, as follows:

A. Class A Treatment

Apply the specified percentage of lime in two equal increments according to the following steps:

1. Spread the first increment of lime.
2. Mix the material.
3. Allow the material to mellow for a minimum of 12 hours and a maximum of 72 hours.
4. Spread the second increment of lime.
5. Mix the material.
6. Compact and finish the material. See Subsection 225.3.05.F, "Compact Lime Layer," for compaction and Subsection 225.3.06.B, "Finishing Requirements," for finishing.

B. Class B Treatment

Apply the specified percentage of lime according to the following steps:

1. Spread the lime.
2. Mix the material.
3. Allow the material to mellow for a minimum of 12 hours and a maximum of 72 hours.
4. Mix the material.
5. Compact and finish the material. See Subsection 225.3.05.F, "Compact Lime Layer" for compaction and Subsection 225.3.06.B, "Finishing Requirements" for finishing.

C. Class C Treatment

Apply the specified percentage of lime according to the following steps:

1. Spread the lime.
2. Mix the material.
3. Compact and finish the material. See Subsection 225.3.05.F, "Compact Lime Layer" for compaction and Subsection 225.3.06.B, "Finishing Requirements" for finishing.

D. Apply Lime

1. General
 - Apply lime according to the rate specified by the Engineer.
 - Apply lime uniformly so that the quantity applied does not vary more than +/- 10 percent of the quantity specified for each section.
 - Apply lime only to areas that can be mixed in one day.
 - Do not mix lime with frozen soils or with soils containing frost. Perform lime stabilization only when the air temperature is above 45 °F (7 °C) and only between April 1 and October 15, unless directed otherwise by the Engineer.
 - Distribute lime at the specified rate by making repeated passes over a section until the required amount has been spread.

- After each pass, incorporate the material into the soil with mixing equipment. If necessary, add more water to the mix to accelerate mellowing.
2. Protect and Ensure Safety
 - Provide the necessary equipment and take the necessary precautions to protect operations personnel from the hazards of lime dust or slurry.
 - Prevent damage, discomfort, or inconvenience to the public or to private property while preparing and distributing lime.

3. Methods

Spread lime on scarified areas at the specified rate. Distribute the material uniformly to avoid excessive loss.

Choose one of the following three methods to apply lime:

a. Dry Application with Quicklime

Adjust the design application rate that was based on using hydrated lime, to reflect the properties of quicklime. Use the following formula to determine the application rate for quicklime:

$$AR_Q = \frac{AR_H}{(1.32)(P)}$$

where;

AR_Q = Application Rate For Quicklime

AR_H = Design Application Rate Based On Hydrated Lime

1.32 = Ratio of molecular weights for hydrated lime (74) and quicklime (56)

P = Certified Percent Purity Of The Quicklime

Do not apply quicklime if the Engineer determines that wind conditions could make blowing lime hazardous to traffic, workers, or adjacent property.

Minimize lime pockets by applying lime to shaped and rolled areas that are relatively smooth. Spread uniformly at the specified rate using a mechanical spreader approved by the Engineer.

b. Slurry Made with Hydrated Lime

Create a lime slurry by mixing 30 percent dry lime solids, by weight, with 70 percent water. Mix slurry in agitating equipment, and continue to agitate until arriving at the roadbed. Spread slurry on the scarified area with distributing equipment.

c. Slurry Made by Slaking Quicklime

Create a lime slurry by slaking quicklime using special equipment at or near the Project site. Obtain the Engineer's approval for all equipment and procedures before work begins

E. Mix Lime

1. General

Maintain the moisture content of the material at its specified optimum or not more than 5 percent over the optimum, at all times.

Add water during mixing if necessary, even if the material has the optimum moisture content to sustain the chemical reaction between lime and water.

Mix the material the same as for "Dry Application" or "Slurry Application" unless indicated otherwise.

a. Immediately after applying the lime:

- 1) Mix to the required depth and width.
- 2) If the depth to be treated, as shown on the Plans, is more than 12 in (300 mm) compacted, treat in approximately equal layers of not more than 12 in (300 mm) deep.

- 3) When multi-layer construction is required, blade the upper layers of the compacted soil in windrows outside the area to be treated until the lower layer is mixed, compacted, and approved by the Engineer.
 - 4) Blade each successive layer back into place, shape and treat it with lime, mix, compact and shape to typical section. Include the cost of this manipulation in the bid price.
 - b. Control scarifying and mixing to provide uniform depth. Make the crown of the undisturbed soil underneath conform as closely as possible to the crown of the finished course.
 - c. Until the lime is incorporated or mixed, allow only spreading, watering, or mixing equipment to drive over the section being processed.
 - d. Determine bulking factors from the dry weight of laboratory-tested raw and lime treated soils. Furnish a finished course of lime treated material that conforms to the specified thickness and surface requirements in the Plans.
2. Mix Lime (Initial)
- a. Class A or Class B Lime Treatment
 - 1) Incorporate lime and water with rotary mixers until uniform. The mixture must pass through a 2 in (50 mm) sieve.
 - 2) Add the amount of water necessary to produce a moisture content of no less than 0 percent below the mixture's optimum moisture content or no more than 5 percent above optimum moisture content. See GDT 19.
 - 3) After mixing is complete, reshape the treated course to the approximate line, grade, and typical section.
 - 4) Seal with a light, pneumatic-tired roller and other approved equipment, as necessary.
 - 5) Mellow for a minimum of 12 hours and a maximum of 72 hours.
 - b. Class C Lime Treatment
 - 1) Incorporate lime and water with rotary mixers until uniform. Continue to mix and add water until obtaining a homogeneous mixture of soil, lime, and water that is satisfactory to the Engineer.
 - 2) After mixing and applying water, ensure that 100 percent of the material by dry weight passes a 1.0 in (25 mm) sieve and 60 percent by dry weight passes a No. 4 (4.75 mm) sieve.
3. Mix and Pulverize Lime (Final)
- The following applies to Class A and Class B lime treatments only.
- a. After the required mellowing period, scarify the layer.
 - b. After a Class A treatment, add the second application of lime.
 - c. Remix the layer as prescribed in the initial mixing operations, adding water as necessary.
 - d. Continue mixing until 100 percent of the material by dry weight, exclusive of gravel and stone, passes a 1.0 in (25 mm) sieve and 60 percent passes a No. 4 (4.75 mm) sieve.
 - e. Ensure that the percent of moisture is at or above the laboratory specified optimum moisture.
 - f. If mixing cannot be completed in one day, seal the surface of the layer with a rubber-tired roller. Continue the process the next day, weather permitting.

F. Compact Lime Layer

Compact the material according to the following requirements and to Subsection 225.3.06.B, "Finishing Requirements" for finishing.

1. Class A and B Lime Treatments

Compact the mixture within 4 hours after completing the final mixing. Maintain the material at a moisture content within ± 2 percent of optimum.

2. Class C Lime Treatment

Compact the mixture immediately after completing the first and only mixing. Maintain the material at a moisture content within ± 2 percent of optimum.

3. Class A, B, and C Treatments

- a. Complete compaction operations during one working day.
- b. Keep the moisture content of the material uniform when compacting. Maintain the material at optimum moisture content or up to two percent over the optimum content.
- c. Compact uniformly and continuously, beginning at the bottom. Use sheepfoot-type rollers. Continue until the entire depth of the mixture is compacted to the required density specified in Subsection 225.3.06.A.
- d. Immediately correct depressions or soft spots that develop in the compacted areas with the following methods:
 - 1) Scarify the area.
 - 2) Add lime when required.
 - 3) Remove the material when required.
 - 4) Reshape and compact.
- e. Stop compaction and remove the sheepfoot-type roller when a layer of loose soil not exceeding 1 in (25 mm) remains.
- f. In addition to the requirements specified for density, compact the full depth of the mixture to the extent necessary for it to remain stable under construction equipment.

G. Cure Lime (Final)

1. General

- a. After the lime-treated soil has been finished as specified in Subsection 225.3.06.B, keep it moist for 7 days.
- b. Lime stabilized subgrade or embankment may be cured by applying water to maintain the course moist during curing.
- c. To protect a lime-stabilized base, subbase, or shoulder course, apply bituminous prime material (see Subsection 225.2.D) according to Section 412.
- d. Apply the prime as soon as possible, but not later than 24 hours after completing the finishing operations, unless delayed by wet weather. If delayed, apply prime as soon as the surface is sufficiently dry.
- e. Ensure the lime-treated soil surface is free of all loose and extraneous material and that it contains sufficient moisture to prevent excessive penetration of the bituminous material.
- f. If directed by the Engineer, sweep the lime-treated soil clean of loose material before applying the prime.

2. Apply the Prime

- a. Apply the bituminous material uniformly to the surface of the lime-treated soil at the rate of 0.15 to 0.30 gal/yd² (0.70 to 1.4 L/m²).
- b. Properly maintain the material during the entire curing period so that all of the lime-treated soil will be covered effectively during this period.
- c. Complete curing prior to placing subsequent layers of material.

3. Protect Lime Layer

- a. If necessary, open completed sections of the lime-treated soil to lightweight local traffic. Make sure the curing is not impaired and that the treated sections have hardened sufficiently to prevent marring or distorting the surface.
- b. Use construction equipment on the lime-treated soil only to discharge material into the spreader during base or paving operations or except as may be permitted for embankment construction.

225.3.06 Quality Acceptance

A. Density Requirements

After shaping the mixture to line, grade, and cross- section specifications, roll the course until uniformly compacted as determined by GDT 19. Use the percentages of maximum dry density in the following table. Determine the in-place density according to GDT 20, GDT 21, or GDT 59, as applicable.

All base, subbase, or shoulder courses	100%
Top 1 ft (300 mm) of embankment (subgrade)	100%
To within 1 ft (300 mm) of the top of the embankment	95%

B. Finishing Requirements

Ensure that the surface of the completed lime-stabilized layer conforms to the lines, grades, and cross- sections shown on the Plans or established by the Engineer and meets the following characteristics:

- Uniform lime mixture
- Smooth
- Dense
- Well-bonded
- Unyielding
- Free of cracks or loose material

Ensure that surface requirements meet the following Specifications:

Subgrade	Subsection 209.3.05.E.
Base, subbase, or shoulder course	Section 301

C. Thickness

If necessary, reconstruct the course or add lime to the course at no additional cost to the Department.

1. Determine the thickness of the lime-stabilized layer, according to GDT 42, at intervals not to exceed 500 ft (150 m).
2. Do not allow the thickness of the entire layer to vary more than 1 in (25 mm), plus or minus, from the thickness shown on the Plans.
3. Immediately reconstruct any section deficient by more than 1 in (25 mm) according to this Specification and the Plans.
4. Add additional lime to correct the deficiency of any section exceeding the 1 in (25 mm) tolerance. Remix to the specified depth and width according to this Specification and the Plans.

225.3.07 Contractor Warranty and Maintenance

Perform the following work at no cost to the Department. Repeat this work as often as necessary to keep the lime-treated soil intact.

- Maintain the lime-treated soil in good condition until The Work is completed and accepted.
- Maintain a smooth surface on the course by blading.
- Immediately repair any defects that occur.

225.4 Measurement

A. Soil-Lime Material

If it is necessary to add other material to the roadbed, or to build the base or subbase entirely with new material, soil-lime material is measured by loose volume cubic yard (meter), as specified in Section 109.

B. Soil-Lime Treated Roadbed, Subbase, and Base Course

If payment is specified by the square yard (meter), soil-lime treated roadbed, subbase, and base course are measured with the methods used for soil-cement specified in Section 301.

C. Lime

- Lime is measured by the ton (megagram).
- If quicklime (CaO) is slaked on the job in an approved mixing tank to produce a lime slurry, the pay quantity for lime is measured in ton (megagram) of hydrated lime. The pay quantity is calculated using the certified lime purity for each truckload as follows:

Total Weight of Hydrated Lime Produced, ton (Mg) = (A x B x 1.32) + A (C)

Where:

A = actual quicklime delivered

B = certified % purity

C = % inert material

1.32 = ratio of molecular weights for hydrated lime (74) and pure quicklime (56)

- If quicklime is spread on the roadbed in a dry application, it is measured by the ton (megagram) based on invoice weight.
- The formula for converting quicklime to hydrated lime does not apply for dry applications.

D. Prime

Bituminous prime is not measured for separate payment. Application will be according to Section 412.

E. Unsuitable Material

Unsuitable materials removed from the roadbed are measured according to the Earthwork Item in the Contract.

225.4.01 Limits

General Provisions 101 through 150.

225.5 Payment

A. Soil-Lime Material

If material is mixed on the job, it may be necessary to add other materials to the roadbed or to build up the base or subbase entirely with new materials. Any additional soil-lime material will be paid at the Contract Price per square yard (meter) or per cubic yard (meter) when in place and accepted.

Payment will be full compensation for the following:

- Shaping and compacting the existing roadbed
- All materials except lime
- Loading and unloading materials
- Hauling materials

- Crushing, processing, mixing, spreading, watering, compacting, and shaping materials
- Maintenance
- All other incidentals necessary to complete the work

B. Soil-Lime Treated Roadbed Base and Subbase Course

A course of soil-lime treated roadbed base and subbase will be paid for at the Contract Price per square yard (meter) when in place and accepted. Payment will be full compensation for the following:

- Preparing the roadbed
- Mixing on the road
- Shaping, pulverizing, watering, and compacting materials
- Repairing all defects
- Maintenance

C. Pre-mixed Soil-Lime Treated Base and Subbase Course

A course of pre-mixed soil-lime treated base and subbase will be paid for at the Contract Price per ton (megagram) or per square yard (meter) when completed, in place and accepted.

Payment will be full compensation for the following:

- Shaping and compacting the existing roadbed
- All materials except lime
- Loading and unloading materials
- Hauling materials
- Crushing, processing, mixing, spreading, watering, compacting, and shaping materials
- Maintenance
- All other incidentals necessary to complete the work.

D. Lime

Only lime in the finished course or courses will be paid at the Contract Price per ton (megagram). Payment will be full compensation for furnishing, hauling, and applying the material.

Payment will be made under:

Item No. 225	Soil-lime material—including material and haul	Per cubic yard (meter)
Item No. 225	Soil-lime treated (roadbed, base, subbase or shoulder course), class _____, thickness_____	Per square yard (meter)
Item No. 225	Lime	Per ton (megagram)

225.5.01 Adjustments

No payment will be made for lime used to correct defects due to faulty equipment or negligence.

Payment will not be made for any lime spread and exposed for four hours or more prior to mixing. Treat such areas again with the full required rate of application.

Add lime, at no additional cost to the Department, to any section on which washing or blowing prior to mixing caused excessive lime loss.

Reconstruct areas, at no cost to the Department, on which lime-treated soil was constructed but not covered with a layer of pavement, base, or other construction material during the same construction season.

The Engineer will test each section as it is completed. Scarify, moisten, rework, and compact any section with a density less than the specified requirements according to the requirements of these Specifications and at no additional cost to the Department.

No payment will be made for lime application exceeding the 10 percent plus tolerance. When the quantity applied is deficient by more than 10 percent, apply additional lime prior to mixing at the Contractor's expense.

Section 228—Grading – Modified

228.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 230—Lump Sum Construction

230.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 231—Miscellaneous Construction, Unpaved Roads and Streets

231.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 232—Railroad Construction

232.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 233—Haul Roads

233.1 General Description

This work includes maintaining and repairing haul roads that are county roads and city streets within the State of Georgia. Haul roads on the State Highway System are not included.

233.1.01 Definitions

Haul roads: Routes used for transporting materials to a Project. Haul roads include routes described in the Contract and alternate routes approved by the Engineer.

233.1.02 Related References

A. Standard Specifications

- Section 109—Measurement and Payment
- Section 209—Subgrade Construction
- Section 317—Reconstructed Base Course
- Section 400—Hot Mix Asphaltic Concrete Construction
- Section 412—Bituminous Prime
- Section 413—Bituminous Tack Coat
- Section 424—Bituminous Surface Treatment

B. Referenced Documents

- Form HD-561
- Form HD-561A

233.1.03 Submittals

If substituting a different road for a haul road designated in the Contract, conduct an inspection of the proposed haul road in conjunction with the Engineer and the governmental agency or political subdivision charged with the control and maintenance of the route.

- After the inspection, prepare an agreement using Form HD-561A, which states existing conditions, maintenance conditions during hauling, and restoration after hauling is completed.
- Sign the agreement together with the governmental agency or political subdivision.
- Submit the agreement for the Engineer’s approval before hauling materials on the proposed route.

233.2 Materials

Restore haul roads with materials that meet the requirements of the following Specifications:

Material	Section
Stabilizer Aggregate (Type I)	209
Reconstructed Base Course	317
Asphaltic Concrete	400
Bituminous Prime	412
Bituminous Tack Coat	413
Bituminous Surface Treatment	424

If any of the above materials are specified in the original Contract under a modified Specification, furnish materials for haul road maintenance and restoration under the same modified Specification.

233.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

233.3 Construction Requirements

Maintain the haul road to the Engineer’s satisfaction during hauling.

233.3.01 Personnel

General Provisions 101 through 150.

233.3.02 Equipment

General Provisions 101 through 150.

233.3.03 Preparation

The Department will determine sources of local materials and commercially produced aggregates and which haul roads exist for transporting the materials.

233.3.04 Fabrication

General Provisions 101 through 150.

233.3.05 Construction

A. Restoration Requirements

When hauling operations are completed, restore the haul road to a condition equal to that which existed before hauling operations were started.

- The Engineer will determine the kind and amount of restoration work required and the procedures and requirements to follow.
- An obligation to maintain and restore the road will not be relieved in the event that other traffic uses the haul road concurrently.
- If another contractor who is also under contract with the Department hauls material over the same route, the Engineer will determine the amount of maintenance and restoration obligation for each contractor.

233.3.06 Quality Acceptance

A. Inspection

When the restoration work on a haul road is completed, a joint inspection of the haul road route will be made under the jurisdiction of a governmental agency or political subdivision other than the Department.

- Inspect the road in conjunction with the Engineer and the governmental agency or political subdivision charged with the control and maintenance of the restored road.
- The Engineer will obtain two copies of the executed Haul Road Release, part of Form HD-561 or HD-561A.
- If using a substitute road, the Contractor must obtain the forms specified above and submit them to the Engineer.

233.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

233.4 Measurement

Materials ordered by the Engineer for maintaining and restoring haul roads are measured as defined in the applicable section of the Specifications.

If using a substitute haul road, materials are measured for payment according to the quantities shown on the Plans for the original haul road. Quantities of materials used above those shown on the Plans will not be measured for payment.

Blading and shaping costs necessary for maintaining and restoring haul roads are not measured for payment.

233.4.01 Limits

General Provisions 101 through 150.

233.5 Payment

Stabilizer aggregate will be paid for under the requirements of Section 209.

All materials, measured as stated above, will be paid at the Contract Price for the Items shown on the Plans and listed in the Proposal.

When the Engineer orders materials other than those listed above, they will be paid on a force account basis under Subsection 109.05, "Extra Work."

233.5.01 Adjustments

General Provisions 101 through 150.

Section 300—General Specifications for Base and Subbase Courses

300.1 General Description

This Specification applies to all base and subbase courses, except asphaltic concrete. Additional requirements for each type of base and subbase are described in the appropriate Sections for specific base and subbase type construction.

300.1.03 Submittals

General Provisions 101 through 150.

300.2 Materials

Find the Specifications for materials to be used and the references for them under the appropriate Section for each base and subbase type construction.

Ensure that each material meets the requirements for the type specified. Incorporate only materials that meet the Engineer's approval.

Admixtures meeting the requirements of Subsection 831.2.03 and approved for use in stabilized bases or subbases shall be governed by the requirements as outlined in Laboratory Standard Operating Procedure No. 5, Quality Control of Portland Cement and Blended Hydraulic Cements and Quality Control of Fly Ash and Granulated Blast-Furnace Slag.

A. Selecting Local Materials at the Source

The Engineer has the authority to classify materials at the source and require the materials to be excavated in the proper sequence so that each kind will reach its destination at the best location for that material in the finished work. The Engineer has the authority to reject any unsuitable materials.

B. Sources of Local Materials Outside the Right-of-Way

Follow the provisions of Subsection 106.10, "Local Material Sources" to obtain materials from local sources outside the right-of-way.

300.2.01 Delivery, Storage, and Handling

A. Storing at Central Mix Plants

Store material at a plant site with enough space for separate stockpiles, bins, or stalls for each size of aggregate. Keep aggregates separated until delivery to the plant feeders for proportioning. Keep the storage yard neat and the stockpiles, bins, and stalls accessible for obtaining samples.

300.3 Construction Requirements

300.3.01 Personnel

Supply all personnel and equipment necessary for obtaining samples from base plants and delivering them to the plant laboratory.

300.3.02 Equipment

Ensure that all equipment for constructing base and subbase courses is of an approved design and in satisfactory condition before construction begins. The equipment required for each type of base or subbase will be determined according to the construction method used.

A. Central Mix Plants

The central mixing plant will not be approved for proportioning, batching, or mixing unless a field laboratory meeting the requirements of Section 152 is available for the exclusive use of the Engineer or Inspector.

Design, coordinate, and operate plants so that the mixture is produced within the specified tolerances. The requirements are as follows.

1. Scales

Section 300- General Specifications for Base and Subbase Course

Before any mixture is delivered to the Project, check all scales with standard weights for accuracy and for agreement with each other.

If weight proportioning is used, provide accurate scales so all ingredients of the mixture can be weighed separately. Use scales that are accurate to within 0.5 percent of the measured load. Support scales with rigid supports so that vibration from the plant does not interfere with accurate readings.

a. Weight Box and Hopper Scales

Use springless dial scales of a standard make and design for weight boxes and hopper. Inspect and seal scales when the Engineer determines it necessary to assure accuracy. Ensure that at least ten 50 lb. (25 kg) weights are available for testing the scales.

b. Motor Truck Scales

With each plant, include a motor truck scale with a platform large enough to accommodate the entire length of any vehicle used. Ensure that the scale is certified according to Section 109 and is large enough to weigh the largest anticipated load. Do not measure weights greater than the rated capacity of the scales.

Ensure that the weights of the aggregate batches in the truck before delivery to the Project are within two percent of the sum of the weights of the batch ingredients.

Complete Forms OMR-TM-141 (Daily Truck Weights) and Form 474 (Tally Sheet) for each day's production and submit them to the Engineer.

2. Mixer

Equip each central mix plant with an approved mixer.

If Portland cement is required, begin mixing immediately after the cement is added to the coarse aggregate and soil mortar. Continue mixing until a homogeneous and uniform mixture is produced.

If the equipment does not produce a homogeneous and uniform mixture that meets these Specifications, the Engineer will require the Contractor to make the changes necessary to accomplish this result.

Any adjustments made to the charge in a batch mixer or the rate of feed to a continuous mixer must ensure a complete mix of all of the material.

Correct dead areas in the mixer where the material does not move or is not sufficiently agitated, by reducing the volume of material or by making other adjustments.

3. Mixture Proportioning

Add Portland cement, bituminous materials, aggregates, or other ingredients in such a manner that they are uniformly distributed throughout the mixture during the mixing operation.

4. Water Proportioning

In all plants, proportion water by weight. Provide a means for the Engineer to verify the amount of water per batch or the rate of flow for continuous mixing.

Use spray bars to evenly distribute moisture throughout the mixture.

5. Sampling

Use sampling equipment approved by the Engineer to obtain samples before combining them with other ingredients or introducing them into the mixer.

Use sampling equipment to provide an accurate representation of the furnished material.

6. Additional Requirements for Continuous-Mixing Plants

a. Feeder System

Continuous mixing plants shall use a feeder system that accurately proportions aggregate from each bin by weight.

Equip each feeder with a device that can change the quantity of material being fed. Use a feeder with adjustments that can be securely fastened.

Ensure that the plant has an interlocking system of feeders and conveyors that can be synchronized to supply a continuous flow of aggregate, including a positive flow of dry and liquid additives for mixing.

Section 300- General Specifications for Base and Subbase Course

Provide an electronic belt-weighing device to monitor the combined aggregates. Ensure that there are meters for maintaining the aggregates and additives at varying production rates.

Use an electronic control package capable of tracking which accepts a signal from the belt-weighing device and signals to continuously vary the dry and liquid additive feeder speed and maintain the feed rate.

Proportion dry additives with a gravimetric (depleting weight) system meeting the following requirements:

- The dry additive gravimetric (depleting weight) system includes an isolation vessel supported by load cells independent of the fines silo.
- Use load cells in conjunction with an electronic scale package having remote digital display and the necessary controls. Continuously weigh the material being metered with a positive displacement feeder mounted on the discharge of the isolation vessel.

b. Control System

Use a control package that has a plant interlock shutdown capability. Plants must be able to shut down if actual flow rates differ from desired flow rates excessively. If the flow rate deviates excessively, an alarm shall sound at any of the aggregate, dry additive, or liquid additive metering devices.

Provide a monitoring station to control the entire operation that shows continuous quantitative data on the production and proportioning of the mix ingredients.

c. Portable Power Units

Equip plants that use portable electric power generators with a frequency meter (graduated and accurate to one hertz) and a voltmeter (graduated and accurate to two volts), installed in the power circuit.

d. Mixer

Use a mixer equipped with enough paddles or blades to produce a uniform and homogeneous mixture. Replace paddle blades that show more than 25 percent wear in the face area. Use paddles that can be adjusted to angular positions on the shafts and that can be reversed to retard the flow of the mix. Keep the mixer level.

e. Surge Hopper

Equip the mixer with a surge hopper. Use a surge hopper that automatically discharges the mixture when it reaches a predetermined level.

7. Additional Requirements For Batch-Mixing Plants

a. Weigh Box or Hopper

Use weigh boxes and hoppers that are suspended on scales, large enough to hold a full batch without spilling or needing hand raking, and equipped with a device for accurately weighing each size of aggregate.

Provide a convenient and accurate means of obtaining samples of aggregates from each bin before the material enters the mixing chamber. Equip each bin compartment with a bin level indicator that automatically stops weighing when a bin is empty.

b. Mixer

Include an approved, leak-proof batch mixer in the plant. Use a mixer fast enough or equipped with enough paddles or blades to produce a properly and uniformly mixed batch. Replace paddles and blades that show more than 25 percent wear in the face area.

c. Weighing Cement

Weigh cement on scales separate from the aggregate batching scales. Ensure that all scales meet the requirements of Section 109.

d. Proportioning Bituminous

Introduce bituminous material into the mixer through spray bars and weigh it on scales separate from the aggregate batching scales.

e. Control of Mixing Time

Use a time-locking device that automatically limits mixing time. Do not mix materials less than 30 seconds.

B. In-Place Mixers

For in-place mixing operations, use mixers that meet the following requirements:

1. Multiple Pass Mixers

Use approved rotary-type multiple pass mixers with sufficient tines that mix cement, soil or soil-aggregate, and water uniformly for the full depth of the course.

2. Traveling Plant Mixers

Use approved traveling mixing plants to pick up the aggregate, soil, or other materials from the windrow or roadway. Use plants equipped with a bottom shell or pan that pick up and mix the material while it is separated from the foundation material during at least 50 percent of the mixing cycle.

Use plants that mix the material for the full depth of the section. Ensure that travelling plants move forward with successive increments the length and width of the roadbed so that the roadbed is compacted and finished in one operation. Ensure that none of the materials being mixed are lost or segregated.

Use plants mounted on wheels or crawler tracks wide enough so that they will not rut or damage the mixed surface when loaded to capacity.

Use plants with a pressurized metering device that introduces water during mixing.

Ensure that devices for proportioning water and materials to be mixed accurately measures the specified amounts while the machine is in motion.

For bituminous stabilization, use plants equipped with a metering device that accurately measures the bituminous material into the mixer within the tolerances specified in Section 302.3.05.B. Ensure that the meter indicator dial has a scale with divisions indicating gallons (liters).

If mixing equipment does not produce a homogeneous and uniform mixture, make the changes necessary to produce this result, as required by the Engineer.

C. Mechanical Cement Spreader

When the material is to be mixed in-place, use an approved mechanical cement spreader to uniformly and accurately spread the cement. Do not use pneumatic tubes to transfer the cement from the tanker to the material to be stabilized.

D. Mixture Spreader

Use an approved mechanical spreader that meets the following requirements to uniformly spread the mixture:

- A height-adjustable strike-off plate to obtain the specified thickness of the finished base
- A self-propelled spreader with rollers to contact the truck tires and push the truck without skewing the spreader or truck
- A hopper large enough to prevent spilling or wasting the material

E. Static Rollers

Use static rollers that meet the following requirements. Use self-propelled static rollers on cement stabilized base.

1. Trench Roller

In this context, “roller” describes a wheel made of a flat metal surface; “wheel” describes a rubber wheel of the automotive type.

When base widening is specified, use at least one trench roller. Use a trench roller that has a guiding roller or wheel that operates in tandem with the compression roller on the area to be compacted or with the auxiliary wheel or roller.

Ensure that the trench roller is equipped with an auxiliary wheel or roller, mounted on a height-adjustable axle. The contact surface of the auxiliary wheel or roller must be adjustable to at least 10 in (250 mm) above and 2 in (50 mm) below the rolling plane of the compression roller. If this adjustment is not sufficient to compact the subgrade to the Plan elevation, adjust the contact surface the necessary amount.

If the steering roller or wheel operates in tandem with the auxiliary wheel or roller, it does not need to be height-adjustable.

Ensure that the auxiliary wheel or roller operates on the surface of the pavement adjacent to the area to be compacted, and at a distance from the edge of the pavement that no damage occurs. Keep the height adjustment of the auxiliary wheel or roller such that the compression roller will develop a smooth, compacted surface true to crown.

Use gas-propelled trench rollers equipped with reversing, smooth operating friction clutches. Ensure that friction clutches have smooth operating brakes of ample capacity. Use either hand-powered or power-operated steering devices.

The compression per inch (25 mm) width of compression roller shall not be less than 300 lbs (545 kg) and not greater than 365 lbs (660 kg). If necessary, use a hollow compression roller and secure the minimum weight with liquid ballast. The trench roller must compact a minimum width of at least 15 in (375 mm).

Fit rollers with adjustable spring scrapers that can scrape in both directions.

2. Steel-Wheel Rollers

Use three-wheel or tandem steel-wheel rollers. Use self-propelled rollers equipped with cleaning devices to prevent material from adhering to the wheels.

For base or subbase materials, use 3-wheel rollers on base or subbase materials that have a minimum weight of 10 tons (9 Mg) and a minimum compression of 325 pounds per inch (580 kg/100 mm) of width for the rear wheels.

Use steel wheel tandem rollers with a minimum weight of 10 tons (9 Mg) and a minimum compression of 225 pounds per inch (400 kg/100 mm) of width for the rear drum.

3. Pneumatic-Tire Rollers

Use pneumatic-tire rollers with a minimum contact pressure of 50 psi (345 kPa) per wheel.

Equip rollers to uniformly distribute the load between all wheels.

Use multiple axle, multiple wheel rollers with wheels staggered on the axles and spaces between each wheel to provide uniform compaction for the full compacting width of roller.

Ensure that the air pressure of any tire does not vary more than 5 psi (35 kPa) from the established pressure.

Operate rollers between 3 mph (5 kph) and 8 mph (13 kph), unless otherwise directed by the Engineer.

4. Sheepsfoot Rollers

Use vibratory or static compaction sheepsfoot rollers of sufficient size and weight to obtain the desired compaction.

F. Vibratory Rollers

Use an approved vibratory roller designed to activate the frequency of vibration and the roller movement separately.

Ensure that the weight and amplitude of the roller can compact the surface to Specifications with a minimum number of passes.

G. Bituminous Sampling Valve

Use bituminous transfer pumps that include a valve for sampling bituminous materials.

H. Fine Grading Machine

Specifications for the Fine Grading Machine are included in either a Special Provision or a Supplemental Specification in the Proposal or in the current Supplemental Specification book.

300.3.03 Preparation

A. Alternate Methods

When alternate methods of construction are provided without restriction, the Contractor may select these alternate methods at will, provided the equipment and organization are suited to the method selected. Before starting construction, discuss the proposed method with the Engineer. The method selected must:

- Spread base or subbase material uniformly without damaging the subgrade, subbase, or the material being placed

Section 300- General Specifications for Base and Subbase Course

- Mix the materials until they are homogeneous
- Use the specified water and cement or bitumen content
- Compact throughout the depth of the course to the density specified
- Complete the work within the specified time limits

Organize the work and equipment so that spreading, compacting, and finishing the base or subbase is a continuous operation. Do not exceed minimum or maximum time limits where the detailed Specifications require them, except in unusual cases where permitted by the Engineer.

B. Preparing the Pit Site

Remove grass, weeds, roots, and other debris from local materials pits. Adhere to the requirements of Subsection 107.23, “Environmental Considerations” when performing this work. Include the cost in the prices bid for the pertinent Pay Items. This work is not considered as clearing and grubbing.

C. Preparing the Subgrade

If the subgrade does not meet the requirements of Section 209 for surface, compaction, and stability, repair all defective portions until it meets the requirements of that Section. Remove unsuitable materials and replace with acceptable material, if necessary. Compact the subgrade as specified in Section 209.

Have enough prepared subgrade meeting the requirements of Section 209 for at least one day of base construction before beginning work.

D. Preparing the Subbase

If a subbase is required, prepare it according to the requirements for surface and compaction. Ensure that it is stable enough to support the equipment that will place the base material without rutting or pumping. Repair all defective portions and replace any unsuitable material with acceptable material, if the subbase does not meet the requirements of the Specifications.

300.3.04 Fabrication

General Provisions 101 through 150.

300.3.05 Construction

A. Draining and Leaving Materials Pits

Keep materials pits well drained while materials are being removed from them. After removing materials, leave pits in the condition required by Section 106 and Section 160.

B. Mining and Mixing in a Pit

Mine all local materials pits within the pit boundaries and grid depths established by the Engineer.

Mine all materials from top to bottom. Mix materials in the pit before hauling to the roadbed or plant.

Place materials in windrows or stockpiles with a dragline or backhoe. Blend the gradation and moisture strata from each pit to a uniform mixture.

When a rim ditch is required and its depth exceeds the specified grid depth of soil-cement material, include only the material above the grid depth as base material. Use this material for the windrow or stockpile of material to be used for soil-cement base unless the Engineer determines that below-the-grid material is satisfactory.

Only use ladder pans and scrapers for stockpiling and windrowing in pits that are less than 18 in (450 mm) deep.

After the preliminary mixing, prevent the coarse materials from segregating from the fine materials with loading equipment that continues to blend the material.

C. Placing Materials

1. Mixture Control

The Engineer will determine the proportions of the materials to be used in compounding the base or subbase. The Engineer will determine the analysis basis of the components.

Change the mix, if required by the Engineer, to ensure that the finished base meets the requirements of these Specifications.

2. Moisture Control

Control the moisture content according to the specified requirements for each type of base or subbase.

Add water uniformly, allow it to evaporate or aerate, and roll the materials as often as necessary, to control the moisture content within the limits specified.

3. Number of Courses

Because the maximum thickness of base or subbase materials to be mixed or spread in one course varies with the equipment used, it is subject to the Engineer’s approval. Ensure that the thickness meets the requirements of Subsection 300.3.05.C.5, “Compaction.”

4. Widening Work

Ensure that widening work conforms to Section 150.

When widening in traffic areas, excavate an area that can be completed in the same day.

When widening pavement on which there is traffic on both sides, stagger operations to keep the widening trench open in one lane of traffic at a time.

5. Compaction

Compact the entire thickness of all bases and subbases to the specified maximum dry weight per cubic foot (meter), as determined by the method specified in the Section for each base or subbase.

If any base or subbase is more than 6 in (150 mm) thick, construct according to the following table for layer thickness:

Material	Layer Thickness
Topsoil, Sand-Clay, or Chert	Two equal layers, or one layer not to exceed 8 in (200 mm)
Graded Aggregate	Two equal layers, or one layer not to exceed 8 in (200 mm)
Cement Stabilized Graded Aggregate	Two equal layers, or one layer not to exceed 8 in (200 mm)
Cement Stabilized Soil Aggregate	Two equal layers, or one layer not to exceed 8 in (200 mm)
Sand Bituminous	Two equal layers, or one layer not to exceed 8 in (200 mm)
Soil-Cement	One layer not to exceed 8 in (200 mm)

D. Meeting Surface Requirements

Produce a smooth, uniform surface that complies with these Specifications.

Rebuild any areas that do not meet the requirements or remove or add material to the area until the Engineer approves of the Work.

300.3.06 Quality Acceptance

A. Monitoring Quality Control

Ensure that the mixture and the materials used meet the following quality controls:

- Before producing any mixture for the Project, calibrate the electronic sensors, devices, or settings for proportioning all mixture ingredients by scale weight. Calibrate in the presence of the Engineer, the proportioning of every ingredient for all rates of production.

Section 300- General Specifications for Base and Subbase Course

- Maintain a dated, written record of the most recent calibration. Post the calibration at the base plant and make the record available for the Engineer's inspection at all times. Format records as graphs, tables, charts, or mechanically prepared data. If the material changes, the rate of production changes by more than +/- 20%, the plant is not producing base material for more than two weeks, or if a component affecting the ingredient proportions has been repaired, replaced, or adjusted, check and recalibrate the proportions.
- Verify the moisture of the mixture being produced. Perform checks on ingredient proportioning and verify truck weight as directed by the Engineer.

Provide quality control personnel and all necessary equipment to perform and document moisture tests. Perform moisture tests at a frequency of at least one test per hour of base plant production.

B. Repairing Defects

During construction: If materials that do not meet these Specifications are placed on the roadway at any time during construction, remove and replace them with acceptable materials as a part of the Pay Item for the base or subbase being constructed.

After construction: Promptly correct defects discovered in the surface finish, thickness, or compaction of the completed base or subbase before The Work is accepted.

- If the base, subbase, or shoulders are deficient in thickness and it is determined that the subgrade elevation is high, remove the materials, lower the subgrade, and reconstruct the course, according to these Specifications at no cost to the Department.
- If job conditions permit and the Engineer mandates, correct areas deficient in thickness by raising the elevation of the surface or adding material to the course.
- In other cases, the Engineer may determine that the defective portions must be entirely removed. Add, mix, spread, and compact new material according to the Specifications and at no cost to the Department.
- If a surface is less than 3 in (75 mm) deep, scarify the area to a depth of at least 3 in (75 mm), except in the case of stabilized bases or subbases. Mix and compact the new and old materials.
- Repair stabilized bases or subbases according to Section 301, Section 302, Section 310, or Section 316, whichever is applicable.

300.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

300.4 Measurement

Base and Subbase courses will be measured in accordance with the Specification Section for the item.

Bituminous prime will not be measured for separate payment.

300.4.01 Limits

General Provisions 101 through 150.

300.5 Payment

Base and Subbase courses will be paid for in accordance with the Specification Section for the item. Include the cost of furnishing and applying bituminous prime in the Unit Price Bid for each individual Base Item according to the applicable provisions of Section 412.

No separate payment will be made for adding water or for aerating or rolling for the purpose of adding water. Include the cost of controlling moisture content in the prices bid for the pertinent Pay Items.

Separate payment will be made only for clearing and grubbing listed in the Proposal or required in the Plans and designated a Pay Item by the Engineer.

No separate payment will be made for stripping excavation unless shown on the Plans and included in the Proposal as a Pay Item.

300.5.01 Adjustments

If the Contractor for the subbase or base is responsible for the subgrade under another Pay Item, no additional payment will be made for any repairs made to the subgrade, except as provided in Section 209.

If another party (not the Contractor) is responsible for the subgrade, removing unsuitable materials will be paid for according to the Earthwork Item in the Contract.

Include compaction, scarification, and any other preparation necessary for the subgrade in the Unit Price Bid for the pertinent base course.

Section 301—Soil-Cement Construction

301.1 General Description

This work includes constructing a base, subbase, or shoulder course composed of soil, or a mixture of soils, and stabilizing with Portland cement. Construct according to these Specifications and conform to the lines, grades, and typical sections shown on the Plans or established by the Engineer.

The provisions in Section 300 apply to this Item.

AASHTO T 134

301.1.03 Submittals

Before constructing a test section, submit a Construction Work Plan to the Engineer for approval.

301.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Specification
Soil-Cement Material	Subsection 814.2.02
Portland cement	Subsection 830.2.01
Water	Subsection 880.2.01
Fly Ash and Slag	Subsection 831.2.03
Cutback Asphalt RC-30, RC-70, RC-250, or MC-30, MC-70, MC-250	Subsection 821.2.01
Blotter Material (Sand)	Subsection 412.3.05.G.3

When fly ash or slag is specified as a mixture in the soil-cement base, use fly ash or slag that meets the physical requirements of Subsection 831.2.03.

301.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

301.3 Construction Requirements

A. General

1. Methods

This Specification is based on the mixed-in-place and central plant mix methods. Supplement in-place or plant mixing with plow, harrow, or blade mixing when the Engineer permits.

When the Plans and Proposal indicate that the material will be paid by the ton (megagram), use the central plant mixing method. If the work will be paid by the square yard (meter), the Plans and Proposal will indicate the required thickness and the mixing method to be used.

When payment is made by the square yard (meter) and a roadway mixer is used, the Engineer will determine if the materials in the roadbed are suitable for use. If the Engineer approves, use materials in the roadbed without payment, except for the payment per cubic yard (meter) provided in Subsection 301.5.A, "Soil-Cement Material" below.

If it is necessary to add other materials to those in the roadbed to meet the desired thickness or to modify the physical properties of the existing materials, these materials will be measured and paid by the cubic yard (meter).

2. Fly Ash and Slag

Unless otherwise specified in the Contract, fly ash and slag shall be used only in central plant mix construction. Apply fly ash and slag to the mix according to the procedures for cement established in Subsection 300.3.02.A, "Central Mix Plants" and Subsection 301.3.05.A.4, "Cement."

3. Weather Limitations

Ensure the following:

Mix and place cement-treated base or subbase only when the weather permits the course to be finished without interruption in the time specified.

Mix and place materials only when the moisture content of the soil to be used in the mixture meets the limits specified in this Subsection.

Begin mixing only when the air temperature is above 40 °F (4 °C) in the shade, and rising.

Ensure that the temperature of the soil to be used in the mixture and the subbase or subgrade is above 50 °F (10 °C).

4. Interruption of Work

If the work is interrupted for more than two hours after cement has been added, or if rain increases the cement's moisture content outside the limits specified in Subsection 301.3.05.B.7.c, "Moisture Control," remove and replace the affected portion at no additional cost to the Department.

301.3.01 Personnel

Ensure that only experienced and capable personnel operate equipment.

301.3.02 Equipment

Use equipment that meets the requirements of Subsection 300.3.02 and this subsection. The Engineer will approve equipment type and condition before construction begins.

Provide sufficient equipment in good working condition to do the following:

- Allow continuous prosecution of the Work.
- Mix, place, and compact within the required time limits.

Use any applicable equipment specified in Subsection 412.3.02, "Equipment" for bituminous prime.

301.3.03 Preparation

A. Subgrade or Subbase Preparation

Prepare the subgrade or subbase as specified in Subsection 300.3.03.C, "Preparing the Subgrade" or Subsection 300.3.03.D, "Preparing the Subbase" if the base, subbase, or shoulders will be composed entirely of new materials, whether mixed-in-place or central plant mixed. In addition to the above requirements, ensure that subgrade material used underneath soil-cement base meets the sulfates and pH requirements of Subsection 814.2.02.A. Place materials only on dry, thawed subgrade or subbase.

301.3.04 Fabrication

General Provisions 101 through 150.

301.3.05 Construction

A. In-Place Mixing

1. Soil

If additional soil is needed on the roadbed, place and spread the soil uniformly to the proper depth to obtain the specified thickness.

2. Pulverization

Pulverize the roadbed materials as follows:

- a. Loosen and pulverize roadbed materials to the width and depth to be stabilized without disturbing or damaging the underlying subgrade.
- b. Continue pulverizing until 100 percent of roadbed material passes through a 1-1/2 in (37.5 mm) sieve, and until at least 80 percent of the soil, excluding any stone or gravel, passes through a No. 4 (4.75 mm) sieve.
- c. Add water to assist pulverization if necessary.
- d. Remove all roots, sod, and rocks that exceed 3 in (75 mm) in diameter.
- e. Remove all other harmful materials.

3. Moisture Adjustments

Immediately before spreading cement, adjust the moisture content of the in-place material so it will stabilize to within 100 to 120 percent of optimum moisture (amount of moisture in the mixture at maximum dry density).

4. Cement

Spread cement as follows:

- a. Uniformly spread the required amount of Portland cement with a cyclone-type mechanical spreader or its equivalent.
- b. Apply the Portland cement at a rate that ensures the pounds spread are within ± 10 percent of the amount specified. Furnish a square-yard cloth, scales and personnel for checking the spread rate of cement placed.
- c. Apply cement on soils with a moisture content less than 120 percent of optimum.
- d. Apply cement on days when wind will not interfere with spreading.
- e. If the cement content is below the 10 percent limit in the mixing area, add additional cement to bring the affected area within the tolerance specified and recalibrate the mechanical spreader's spread rate. If the cement content is more than the 10 percent limit in the mixing area, the excess quantity will be deducted from the Contractor's pay for cement.
- f. Regulate operations to limit the application of cement to sections small enough so that all of the compacting and finishing operations specified in Subsection 301.3.05.B.7, "Compacting and Finishing" can be completed within the required time limits.
- g. Pass only spreading and mixing equipment over the spread cement. Operate this equipment so that it does not displace cement.
- h. Replace damaged cement at no additional cost the Department when damage is caused by:
 - Hydration due to rain, before or during mixing operations
 - Spreading procedures contrary to the requirements mentioned above
 - Displacement by the Contractor's equipment or other traffic

5. Mixing

Mix the material as follows:

- a. Uniformly windrow the material if the mixing plant requires it. Otherwise, shape the material to the proper line, grade, and cross-section before mixing.
- b. Mix the material according to either roadmix method in Subsection 301.3.05.A.6, "Road Methods."
- c. Begin mixing as soon as practical after the cement is spread, and continue until a homogeneous and uniform mixture is produced. If the equipment does not produce a homogeneous and uniform mixture meeting these Specifications, make any necessary changes to meet the Engineer's requirements.

6. Road Methods

a. Multiple Pass Mixing

Perform multiple pass mixing as follows:

- 1) After spreading the cement, mix it with the material to be treated.
- 2) Ensure that the material has been adjusted for moisture as stated in Subsection 301.3.05.B.7.c, "Moisture Control."
- 3) Continue mixing with successive passes until a uniform mixture of cement and soil, or soil-aggregate is obtained.
- 4) Immediately after the preliminary mixing of cement and soil or soil-aggregate, add water as needed to maintain or bring the mixture to within the moisture requirements of Subsection 301.3.05.B.7.c, "Moisture Control."
- 5) Uniformly mix the additional water to incorporate it into the full depth of the mixture.

b. Traveling Plant Mixing

Perform traveling plant mixing as follows:

- 1) After spreading the cement, mix it with an approved traveling plant mixer.
 - 2) Ensure that the mixer picks up the full depth of material from the windrow on the roadbed onto the bottom shell or pan.
 - 3) Mix at a speed that ensures a uniform mixture of soil, cement, and water.
 - 4) Apply water through a water-metering device on the plant to uniformly distribute the proper amount of water to the loose material on the shell or pan. Distribute the water so that cement balls do not form.
 - 5) Continue to mix the cement and water so that all material to be treated is mixed at once.
 - 6) Ensure that there is enough mixture to produce, after final compaction, a course within allowable tolerances.
7. Compacting and Finishing
- Compact and finish according to Subsection 301.3.05.B.7, "Compacting and Finishing".

B. Central Plant Mixing

1. Soil

Do the following:

- a. Before introducing any soil into the mixer, pulverize it until 100 percent passes a 1-1/2 in (37.5 mm) sieve.
- b. Ensure that at least 80 percent of the soil, excluding any stone or gravel, passes through a No. 4 (4.75 mm) sieve.
- c. Have enough stockpile material meeting the requirements of Subsection 300.3.05.B, "Mining And Mixing In A Pit" for at least one day of base construction before operations begin.

2. Cement

Do the following:

- a. Measure cement by weight.
Uniformly add cement into the mixture. The cement incorporated, per ton (megagram) of soil, shall be within ± 5 percent of the amount prescribed by the Engineer.
- b. Perform cement checks that compare the actual percent cement in the mixture with the required percent cement specified in the approved Mix Design for the Project on each of the first two tankers supplying cement to the plant. If these checks are within the specified tolerance, one cement check per day will be required.
- c. Perform and make available to the Engineer a minimum of four daily comparison checks between the certified scales and the plant computer to ensure the proper percentage of cement is being incorporated into the mixture between cement checks.
- d. When a cement check is out of the specified tolerance, at least two, passing one-tanker checks, are required before returning to a one cement check per day basis. When three consecutive cement checks fail to meet the specified tolerance, discontinue soil-cement plant production. Correct the problem, and recalibrate the plant as specified in Subsection 300.3.06.A "Monitoring Quality Control" before resuming the work.
- e. When the cement content exceeds the specified tolerance, the Department will deduct the excess cement from the Contractor's pay for cement. When the cement content does not meet the specified tolerance, the Engineer will evaluate the strength of the affected area after 7 days.
- f. Correct any areas of base with deficient strength as specified in the Strength Correction Chart at no additional cost to the Department, regardless of the percent of compaction. This correction also applies to the test section described in Subsection 301.3.05.B.7.a, "Test Section."
- g. Quantities of cement used in calibrating the plant will also be deducted from the Contractor's pay for cement.

3. Mixing

Do the following:

- a. Measure proportions of soil, cement, and water separately and accurately before mixing.
- b. Charge all materials into the mixer together. Begin mixing immediately.
- c. Mix until a homogeneous and uniform mixture is produced. If the final blend of materials is not homogeneously mixed or does not meet the moisture range specified in Subsection 301.3.05.B.7.c, "Moisture Control," cease plant operations until corrections are made in the plant or to the materials.

4. Hauling

Do the following:

- a. Deliver soil-cement material to the Project.
- b. Spread soil-cement material so that compaction can begin within 45 minutes after the soil, cement, and water have been charged into the mixer.
- c. Protect the mixture in transit by using a securely fastened waterproof cover large enough to extend down over the sides and the end of the bed of each haul vehicle.

5. Spreading

Spread the soil-cement mixture as follows:

- a. Use an approved mixture spreader as specified in Subsection 300.3.02.D, "Mixture Spreader" to obtain the specified thickness. Spread the mixture the full width of the area to be covered.
- b. Ensure that trucks and other construction equipment, including motor graders, do not travel over the material until compaction equipment has made initial passes over the mixture.
- c. Ensure that less than 30 minutes elapse between the placement of cement-treated material in adjacent lanes at any location, unless longitudinal joints are specified.

6. Thickness of Course

Compact the soil-cement base to a maximum thickness of 8 in (200 mm). Place the full thickness in one course only and compact as specified in Subsection 301.3.05.B.7, "Compacting and Finishing" below.

7. Compacting and Finishing

a. Test Section

Construct a test section as follows:

- 1) Use the first section of each constructed soil-cement base course as a test section.
- 2) Use a test section between 350 ft (100 m) and 500 ft (150 m) long for the designated width.
- 3) Before constructing a test section, submit a Construction Work Plan to the Engineer for approval. The Construction Work Plan must indicate proposed equipment and compaction procedures.
- 4) If the Construction Work Plan is approved, the Engineer will evaluate the Work Plan during test section construction. The Engineer will evaluate compaction, moisture, homogeneity of mixture, thickness of course, and laminations or compaction planes (scabbing).
- 5) If the Engineer determines that the Work Plan is not satisfactory, revise the compaction procedure and augment or replace equipment, as necessary, to complete work according to the Specifications.

b. Time Limits

Observe the following time limits:

- 1) Begin compaction within 45 minutes of the time water is added to the soil-cement mixture.
- 2) Complete compaction within 2 hours.
- 3) Complete all operations in four hours, from adding cement to finishing the surface.

c. Moisture Control

Control moisture as follows:

- 1) During compaction, ensure a uniform moisture content of the mixture that is between 100 and 120 percent of the optimum moisture content.
- 2) If the moisture content exceeds the tolerance at any time, cease operations immediately and make the adjustments necessary to bring the moisture content within tolerance.
- 3) Do not use materials that “pump” under construction traffic, regardless of moisture content.

d. Additional Compaction Requirements

Perform the following additional compaction requirements:

- 1) Compact the soil-cement base, subbase, or shoulder course to at least 98 percent of the maximum dry density as determined in this Subsection.
- 2) Do not perform vibratory compaction on materials more than 1-1/2 hours old, measured from the time the cement was added to the mixture.
- 3) Uniformly compact the mixture and then fine-grade the surface to the line, grade, and cross-section shown on the Plans.
- 4) Loosened material accumulated during this process is considered waste and is to be removed from the Project. Do not use additional layers of cement-treated materials in order to conform to cross-sectional or grade requirements.
- 5) Use a pneumatic-tired roller to roll the finished surface until the surface is smooth, closely knit, free from cracks, and in conformance with the proper line, grade, and cross-section.
If the Engineer requires, lightly apply water to the finished surface to aid in sealing the completed base and preparing the surface for priming.
- 6) At any place inaccessible to the roller, secure the required compaction with mechanical tampers approved by the Engineer. The same compaction requirements stated in the above Subsection apply.

e. Additional Finishing Requirements

Perform the following additional finishing requirements:

- 1) Use the automatically controlled screed equipment when required by Subsection 300.3.03.H, “Fine Grading Machine” of the Specifications. Control fine-grading for this requirement with sensing wires or a taut stringline. Furnish, install, and maintain this operation as a part of this Pay Item. When automatically controlled screed equipment is not required, fine-grading with motor graders is permitted.
- 2) Fine-grade the surface of the cement-stabilized subbase for Portland cement concrete pavement or the cement-stabilized base for asphaltic concrete pavement.
- 3) Fine-grade immediately after placement and compaction. Roll the subbase again according to this Subsection.

8. Construction Joints

Form construction joints as follows:

- a. Form a straight transverse joint at the end of each day’s construction or when the work is interrupted so that the material cannot be compacted within the time limit specified in this Subsection.
- b. Create the straight transverse joint by cutting back into the completed work to form a true vertical face free of loose or shattered material.
- c. Form the joint at least 2 ft (600 mm) from the point at which the strike-off plate of the spreader comes to rest at the end of the day’s work, or at the point of interruption.

- d. Form a longitudinal joint as described above if the soil-cement mixture is placed over a large area where it is impractical to complete the full width during one day's work. Use the procedure for forming a straight transverse joint. Ensure that waste material is removed from the compacted base.

9. Prime

Apply bituminous prime to the finished surface of the base course at the end of each day or as soon as the Engineer determines it is practical. Apply prime only to an entirely moist surface.

If weather delays prime application, apply prime as soon as the surface moisture is adequate. Apply prime according to Section 412.

10. Opening To Traffic

No traffic or equipment is permitted to operate on the finished base, subbase, or shoulders until the prime has hardened enough so that it does not pick up under traffic. For the first seven days after priming, traffic is restricted to lightweight vehicles such as passenger cars and pickup trucks. Vehicles with an average axle load exceeding 20,000 pounds (9 Mg) will not be allowed on the finished base or subbase at any time.

Correct any failures caused by traffic at no additional cost to the Department.

11. Protection of Course

Maintain the base, subbase, or shoulder course constructed under these Specifications until the Engineer determines that it has sufficiently cured and is ready to be covered with the next base or pavement course. Make repairs specified in Subsection 300.3.06.B, "Repairing Defects" whenever defects appear. This preservation action does not relieve the Contractor of his responsibility to maintain The Work until final acceptance as specified in Section 105.

301.3.06 Quality Acceptance

A. Compaction Tests

Test compaction as follows:

1. Determine the maximum dry density for central plant mix construction from representative samples of the material to be compacted according to GDT19 (AASHTO T 134).
2. Determine the maximum dry density for mixed-in-place construction according to GDT 19 or GDT 67.
3. Determine the in-place density of the cement-stabilized base, subbase, or shoulders as soon as possible after compaction, but before the cement sets. Determine in-place density according to GDT 20, GDT 21, or GDT 59.

B. Finished Surface Tests

Test the finished surface as follows:

1. Check the finished surface of the cement stabilized base, subbase, or shoulder course transversely.
2. Place a 15 ft (4.5 m) straightedge parallel to the centerline. Additionally, use one of the following tools:
 - A template, cut true to the required cross-section and set with a spirit level on nonsuperelevated sections
 - A system of ordinates, measured from a stringline
 - A surveyor's level
3. Ensure that ordinates measured from the bottom of the template, stringline, or straightedge to the surface do not exceed 1/4 in (6 mm) at any point. Rod readings shall not deviate more than 0.02 foot (6 mm) from the required readings.
4. Correct any variations from requirements immediately, as specified in Subsection 300.3.05.D.

C. Tolerances

1. Thickness Measurements

- a. Thickness requirements apply to shoulder construction where the Plans specify a uniform thickness, or where the shoulders will be surfaced. Do the following:
- b. Determine the thickness of the base, subbase, or shoulder course, by making as many checks as necessary to determine the average thickness.

2. Deficient Thickness

- a. If any measurement is deficient in thickness more than 1/2 in (13 mm), make additional measurements to determine the deficient area.
- b. Correct any area deficient by more than 1/2 in (13 mm) to the design thickness by using one of the following methods according to these Specifications:
 - Apply Asphaltic Concrete 9.5 mm Superpave.
 - Remove material to the full depth of the course and reconstruct to the required thickness.

No payment will be made for any 9.5 mm Superpave asphaltic concrete applied to correct deficiencies nor will payment be made for removing and reconstructing the deficient work.

3. Average Thickness

Average thickness is measured as follows:

- a. The average thickness per linear mile (kilometer) is determined from all measurements within the mile (kilometer) increments.
- b. The average thickness shall not exceed the specified thickness by more than 1/2 in (13 mm).

If the unit of payment is by the ton (megagram) or cubic yard (meter), and the average thickness for any mile (kilometer) increment exceeds the allowable 1/2 in (13 mm) tolerance, payment for the excess quantity in that increment will be deducted.
- c. The excess quantity is calculated by multiplying the average thickness that exceeds the allowable 1/2 in (13 mm) tolerance by the surface area of the base, subbase, or shoulder, as applicable.

4. Strength

Do the following:

- a. Ensure that the strength of the soil-cement base, subbase, or shoulder course is at least 300 psi (2070 kPa), as determined from testing the unconfined compressive strength of cores from the completed course in accordance with GDT 86.
- b. If a strength test falls below 300 psi (2070 kPa), do the following:
 - 1) Isolate the affected area by securing additional cores.
 - 2) Average all compressive strengths in the affected area to determine the basis for corrective work according to the table below or the Engineer's directions.

5. Compaction

The compaction requirement for soil-cement base, subbase, or shoulder course shall be a minimum of 98 percent of the specified theoretical density.

If any compaction test falls below 98 percent, core and retest the represented area for compressive strength determination after 7 days. If the strength is 300 psi (2070 kPa) or greater, no correction will be required. If the strength is less than 300 psi (2070 kPa), isolate the affected area by obtaining additional cores.

Average all compressive strengths in the affected area to determine the basis for corrective work, according to the following table.

Compressive Strength	Correction Work
300 psi (2070 kPa) or greater	None
200 psi (1380 kPa) to 299 psi (2069 kPa)	6 in & 8 in (150 mm & 200 mm) base—add 135 lbs/yd ² (75 kg/m ²) asphaltic concrete
Less than 200 psi (1380 kPa)	Reconstruct affected area

Ensure that a corrected area requiring asphaltic concrete is at least 150 ft (45 m) long.

Perform corrective work requiring asphaltic concrete or reconstruction at no additional cost to the Department.

301.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

301.4 Measurement

A. Soil-Cement Material

Soil-cement material is measured by the cubic yard (meter), loose volume, as specified in Section 109, during mixed-in-place construction if it is necessary to add materials to the roadbed or to build up the base, subbase, or shoulders with new material.

B. Soil-Cement Stabilized Base, Subbase, and Shoulder Course

Soil-cement stabilized base, subbase, and shoulder course are measured as follows:

1. The surface length is measured along the centerline when payment is specified by the square yard (meter). The width is specified on the Plans.
 - a. Irregular areas, such as turnouts and intersections, are measured by the square yard (meter).
 - b. Material is measured in tons (megagrams), as mixed and accepted, when payment is specified by the ton (megagram).

The actual weight is determined by weighing each loaded vehicle on a required motor truck scale as the material is hauled to the roadway. The actual weight will be the pay weight; no deduction will be made for the weight of the cement.

C. Portland Cement

Portland cement is measured by the ton (megagram).

D. Fly Ash and Slag

Fly ash and slag are measured by the ton (megagram) according to this Specification.

E. Prime

Bituminous prime is not measured for separate payment. Include the cost of furnishing and applying bituminous prime according to the provisions of Section 412 in the Unit Price Bid for each individual base item.

F. Unsuitable Material

Unsuitable materials that have been removed are measured and paid for according to the Earthwork Item in the Contract.

301.4.01 Limits

General Provisions 101 through 150.

301.5 Payment

A. Soil-Cement Material

Where in-place mixing is done, and when it is necessary to add other materials to those in the roadbed or to build up the base, subbase, and shoulders entirely with new materials, the added soil-cement material, in place and accepted, will be paid at the Contract Price per cubic yard (meter). Payment will be full compensation for soil-cement material; mixing in the pit; loading, hauling, and unloading; and spreading

B. Soil-Cement Stabilized Base, Subbase, and Shoulder Course

Where specified, soil-cement stabilized base, subbase, and shoulder course, in place and accepted, will be paid at the Contract Price per square yard (meter). Payment will be full compensation for roadbed preparation, mixing on the road, shaping, pulverizing, watering, compaction, defect repair, and maintenance.

C. Pre-mixed Soil-Cement Stabilized Base, Subbase, and Shoulder Course

Where specified, pre-mixed soil-cement stabilized base, subbase, and shoulder course, in place and accepted, will be paid at the Contract Price per ton (megagram) or square yard (meter).

Payment will be full compensation for roadbed preparation; all materials except Portland cement; loading, hauling, and unloading; mixing; spreading; watering; rolling and shaping; and maintenance.

D. Portland Cement

Portland cement will be paid at the Contract Price per ton (megagram). Payment is full compensation for furnishing, hauling, and applying the material. Only Portland cement incorporated in the finished course will be paid; no payment will be made for cement used to correct defects due to the Contractor’s negligence, faulty equipment, or plant calibration error.

E. Fly Ash and Slag

Fly ash and slag will be paid at the Contract Price per ton (megagram), according to this Subsection. Payment will be full compensation for hauling and applying the materials. Only fly ash and slag incorporated into the finished course will be paid; no payment will be made for fly ash and slag used to correct defects due to the Contractor’s negligence, faulty equipment, or plant calibration error.

Payment will be made under:

Item No. 301	Soil-cement material—including material and haul	per cubic yard (meter)
Item No. 301	Soil-cement stabilized base, subbase, and shoulder course ___ in (mm)	per square yard (meter)
Item No. 301	Pre-mixed soil-cement stabilized base, subbase, and shoulder course—including material and haul	per ton (megagram) or per square yard (meter)
Item No. 301	Pre-mixed soil-cement stabilized base and shoulder course—including material and haul	per ton (megagram) or per square yard (meter)
Item No. 301	Portland cement	per ton (megagram)
Item No. 301	Fly ash and slag	per ton (megagram)

301.5.01 Adjustments

General Provisions 101 through 150.

Section 302—Sand-Bituminous Stabilized Base Course

302.1 General Description

This work includes constructing a base course composed of sand, or a mixture of sands that is stabilized with bituminous materials. Construct the base course according to these Specifications and to the lines, grades, and typical cross-sections shown on the Plans or established by the Engineer.

All of the provisions of Section 300 apply to this Item.

302.1.01 Definitions

General Provisions 101 through 150.

302.1.03 Submittals

General Provisions 101 through 150.

302.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Specification
Sand for Bituminous Base	Subsection 814.2.03
RC-800	Subsection 821.2.01
Bituminous Prime:	Subsection 821.2.01

Section 302-Sand-Bituminous Stabilized Base Course

Material	Specification
Cutback Asphalt, RC-30, RC-70, RC-250, or MC-30, MC-70, MC-250	
Emulsified Asphalt, EAP-1	Subsection 822.2.01
Cutback Asphalt Emulsion, CBAE-2	Subsection 823.2.01
Blotter Materials (Sand)	Subsection 412.3.05.G.3

Produce a sand-bituminous mixture with a resistance to plastic flow of 200 lbs (90 kg) minimum when tested according to ASTM 1138.

Produce a sand-bituminous mixture with a maximum 4 percent, 7-day absorption when tested according to GDT 8.

302.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

302.3 Construction Requirements

A. General

1. Methods

Use the central plant mixing method when the sand-bituminous stabilized base course is to be paid for by the ton (megagram). Mix, spread, and compact the material according to Section 400, with the following exceptions:

- No test strip is required.
- The Compaction Acceptance Schedule does not apply.

Use either the central plant or traveling plant mixing method when the sand-bituminous stabilized base course is to be paid for by the square yard (meter).

Use the central plant mixing method when the sand-bituminous stabilized base course is used for widening in addition to the use of suitable special rollers for compaction.

Use plow and harrow mixing only for aeration according to Subsection 302.3.05.D.1, "Preparing Mixture for Compaction."

2. Temperature Limitations

Do not apply bituminous materials when the air temperature is less than 60 °F (15 °C) in the shade nor when the temperature of either the subgrade, subbase, or soil to be used in the mixture is below 50 °F (10 °C).

302.3.01 Personnel

General Provisions 101 through 150.

302.3.02 Equipment

Provide all necessary equipment (in satisfactory condition) on the Project before work commences. Use applicable equipment specified in Subsection 412.3.02, "Equipment" for bituminous prime.

302.3.03 Preparation

When constructing the base from new materials, prepare the subgrade or subbase as specified in Subsection 300.3.03.C, "Preparing the Subgrade." or Subsection 300.3.03.D, "Preparing the Subbase"

Prepare the subgrade or subbase by scarifying a minimum of 2 ft (600 mm) on each side of the Plan width and to the depth of material when the Engineer determines that any existing roadbed materials are suitable for mixed-in-place base construction.

Blend new materials with the prepared roadbed thoroughly before adding bituminous material.

302.3.04 Fabrication

General Provisions 101 through 150.

302.3.05 Construction

A. Process

1. In-Place Mixing

- a. The Engineer will determine the suitability of existing roadbed materials for inclusion in the base course.
- b. Remove all roots, sod, or rock more than 3 in (75 mm) in diameter and all other harmful materials from the roadbed during processing.
- c. Place additional new soil (sand) on the roadbed and spread it uniformly to the proper depth to obtain the Plan thickness of the compacted base course. Place materials only on dry, unfrozen subgrade or subbase.
- d. Loosen and pulverize the material to be stabilized without disturbing or damaging the underlying subgrade or subbase. Add water as needed to assist pulverization.
 - 100 percent of material shall pass the 1.5 in (37.5 mm) sieve.
 - A minimum of 80 percent of the soil (exclusive of stones or gravel) shall pass the No. 4 (4.75 mm) sieve.
- e. Provide moisture content between 2 and 8 percent by weight of the soil before adding the bituminous material. The moisture content shall be adjusted under the Engineer's direction.
 - 1) Add water at the mixer using accurate gauging devices.
 - 2) Ensure that the moisture is uniformly distributed.
- f. Shape the material to obtain the grade and cross- section required in the Plans. Windrow the material uniformly only if the mixing plant operation requires.
- g. Uniformly apply the bituminous material after adjusting the moisture content and shaping has been completed.
- h. Apply the bituminous material only as temperatures allow per the following table.

	Minimum	Maximum
RC-800 Cutback Asphalt	160 °F (70 °C)	210 °F (100 °C)

- i. Mix the sand-bituminous mixture in successive sections so that the roadway can be compacted full width in one operation. Ensure that a uniform mixture is produced.
2. Central Plant Mixing Method
- a. Thoroughly pulverize material so that 100 percent will pass through a 1.5 in (37.5 mm) sieve and at least 80 percent of the soil, excluding any stone or gravel, will pass through a No. 4 (4.75 mm) sieve.
 - b. Adjust the moisture content of the pulverized base material according to Subsection 302.3.05.A.1.d.
 - c. Mix as follows:
 - 1) Proportion the sand-bituminous material and water separately.
 - 2) Charge all materials into the mixer together and mix immediately.
 - d. Mix until a uniform mixture is produced.
 - e. Ensure that the temperature of the bituminous material is between 160 °F (70 °C) and 210 °F (100 °C) for mixing.
 - f. Spread the sand-bituminous mixture to the proper depth to obtain the thickness required on the Plans of the finished base course.
 - Use an approved spreader.
 - Place sand-bituminous material only on a dry subgrade or subbase.

B. Quantity of Bituminous Material

The Engineer will determine the quantity of bituminous material required. Apply the bituminous material uniformly, using an amount within 5 percent of the required quantity.

If bituminous material is applied at a rate more than 5 percent in excess of the required amount and it is considered detrimental, remove and reconstruct the section. If the application rate is more than 5 percent and the material is left in place, no payment will be made for bituminous material in excess of the 5 percent tolerance.

Correct any shortage of bituminous material more than 5 percent less than the required amount by applying additional bituminous material. The cost of reapplying, remixing, and compacting will be included in this Pay Item at no additional cost to the Department.

C. Extent of Application

Limit the application of the bituminous material so that aeration and compaction can begin immediately after mixing.

D. Mixing

1. Preparing Mixture for Compaction

- a. Shape the base to line, grade, and cross-section indicated in the Plans.
- b. Aerate the mixture as follows:
 - 1) Begin aeration as soon as the prepared base is long enough to permit the operation of aeration equipment.
 - 2) Loosen and turn the mixture with harrows, blades, or the equivalent, until the volatile solvents and water evaporate and the mixture is tacky.
- c. If rain threatens the work, roll the surface enough to exclude as much rainwater as possible. Resume aeration as soon as weather permits.

2. Thickness of Courses

- a. Spread the base as follows:
 - 1) Spread to a maximum compacted lift thickness of 8 in (200 mm).
 - 2) Lay the maximum lift thickness for which the specified compaction is obtained, otherwise lay the base in more than one course.

E. Compacting and Finishing

Compact as soon as the condition of the material and the weather permit. Bring the base to line, grade, and cross-section. Roll until the full depth of the course is compacted to 95 percent of the maximum dry density of the sand, without bituminous material.

1. Single-Course Construction

After the base has been compacted, do the following:

- a. Shape the course to line, grade, and cross-section again.
- b. Roll the surface with a pneumatic-tired roller followed by a steel-wheel roller to seal the surface. Begin at the edges and work toward the center until the surface is smooth, closely knit, free from cracks, and in conformance with the proper line, grade, and cross section.
- c. Correct any defects specified in Subsection 300.3.06.B, "Repairing Defects."

2. Multiple-Course Construction

After compacting the first course, do the following:

- a. Shape the surface again to line, grade, and cross-section.
- b. Spread and compact the second and succeeding courses as previously described.
- c. Finish the surface according to the procedure specified for Single-Course Construction, above.

3. Compact Irregular Areas

Compact irregular areas inaccessible to a roller by using mechanical tampers approved by the Engineer. Density requirements are unchanged from above.

F. Prime Coat

Apply bituminous prime according to Section 412.

G. Preservation of Base

Maintain the base in a smooth and acceptable condition until it is covered by other construction.

1. Make repairs to any defects as specified in Subsection 300.3.06.B, "Repairing Defects."
2. Preserving the base as specified does not relieve the Contractor of the general duty to maintain The Work until it is accepted as specified in Section 105.

302.3.06 Quality Acceptance

A. Compaction Tests

Test compaction as follows:

1. Determine the maximum dry density from representative samples of the material before adding the bituminous material by GDT 7 or GDT 67.
2. Determine the in-place density of the base according to AASHTO T 191 or GDT 59

B. Finished Surface Tests

Check the finished surface of the base, subbase, or shoulder course as follows:

1. Check the longitudinal surface using a 15 ft (4.5 m) straightedge parallel to the centerline.
2. Check the transverse surface by using one of the following tools:
 - a. A template, cut true to the required cross- section and set with a spirit level on non-superelevated sections
 - b. A system of ordinates, measured from a stringline
 - c. A surveyor's level
3. Ensure that ordinates measured from the bottom of the template, stringline, or straightedge, to the surface do not exceed 1/4 in (6 mm) at any point. Rod readings shall not deviate more than 0.02 ft (6 mm) from required readings.
4. Correct any variations from these requirements immediately according to Subsection 300.3.06.B, "Repairing Defects."

C. Thickness Tolerances

1. Thickness Measurements

Determine the thickness of the base, subbase, or shoulder course, by making as many checks as necessary to determine the average thickness.

2. Deficient Thickness

- a. If any measurement is deficient in thickness more than 1/2 in (13 mm), make additional measurements to determine the deficient area.
- b. Correct any area deficient between 1/2 in (13 mm) and 1 in (25 mm) to the design thickness by using one of the following methods according to these Specifications:
 - Apply Asphaltic Concrete 9.5 mm Superpave.
 - Leave in place and accept payment for the materials and area (if the course is mixed in place) at 1/2 the Contract Unit Price for the deficient area.
- c. Correct any area deficient in thickness by more than 1 inch (25 mm) by applying Asphaltic Concrete 9.5 mm Superpave or removing the material to the full depth of the course and reconstructing to the required thickness in accordance with these Specifications.

- d. If payment is made by the cubic yard (meter) or ton (megagram), payment for Asphaltic Concrete 9.5 mm Superpave to correct deficiencies will be made at the Contract Unit Price that applies to the course needing correction. Payment for additional material used in reconstructing an area will be made at the Contract Unit Price, but the removed material removed will be deducted from payment.
- e. If payment is made by the square yard (meter), no payment will be made for additional material required to correct deficiencies or reconstructing deficient work.

3. Average Thickness

Average thickness is measured as follows:

- a. The average thickness per linear mile (kilometer) is determined from all measurements within the mile (kilometer) increments except the areas deficient by more than 1/2 in (13 mm) and not corrected.
- b. The average thickness shall not exceed the specified thickness by more than 1/2 in (13 mm).
- c. If the basis of payment is per cubic yard (meter) or ton (megagram) and the average thickness for any mile (kilometer) increment exceeds the allowable 1/2 in (13 mm) tolerance, the excess quantity in that increment will be deducted from the Contractor's payments.
- d. The excess quantity is calculated by multiplying the average thickness that exceeds the allowable 1/2 in (13 mm) tolerance by the surface area of the base, subbase, or shoulder, as applicable.
- e. If the basis of payment is per square yard (meter), no deduction will be made for excess thickness.

302.3.07 Contractor and Warranty and Maintenance

General Provisions 101 through 150.

302.4 Measurement

A. Sand Bituminous Stabilized Base Course Materials

When a mixed-in-place construction method is used, any additional materials necessary to add to the roadbed will be measured by loose volume in cubic yards (meters) of additional material added according to Section 109.

B. Sand Bituminous Stabilized Base Course

When payment is by the square yard (meter), measure length along the centerline in feet (meters) and use the Plan width to calculate area. Use actual dimensions of irregular areas placed to calculate the number of square yards.

When payment is by the ton (megagram), measure the actual weight of the sand-bituminous mixture on approved scales.

C. Bituminous Materials

Measure bituminous materials incorporated into the mixture according to Section 109.

No separate measurement will be made for bituminous prime.

D. Unsuitable Material

Measure unsuitable material removed according to the Earthwork Item in the Contract.

302.4.01 Limits

General Provisions 101 through 150.

302.5 Payment

A. Base Course Material

Sand Bituminous Stabilized Base Course materials, in place and accepted, will be paid at the Contract Unit Price per cubic yard (meter), which shall be full compensation for furnishing the material where specified in the Pay Item, mixing the pit, for all loading, unloading, spreading as here specified, and for hauling where specified in the Pay Item.

Section 302-Sand-Bituminous Stabilized Base Course

B. Sand-Bituminous Stabilized Base Course

Sand-Bituminous Stabilized Base Course, complete in place and accepted, will be paid for at the Contract Unit Price per square yard (meter), which shall be full compensation for preparation of the roadbed, for mixing on the road, shaping, pulverizing, hauling, watering, compaction, repair of all defects, and maintenance

C. Sand-Bituminous Stabilized Base Course Pre-Mixed

Sand-Bituminous Stabilized Base Course, complete in place and accepted, will be paid for at the Contract Unit Price per ton (megagram) or per square yard (meter), which shall be full compensation for preparation of the roadbed, for all materials except bituminous materials, and for loading, unloading, all hauling, mixing, spreading, watering, rolling, shaping, and maintenance.

D. Bituminous Material

The number of gallons (liters) of bituminous material, except bituminous material in excess of the 5% tolerance and except that used as Bituminous Prime, will be paid at the Contract Unit Price per gallon (liter), complete and in place.

Payment is full compensation for providing bituminous material, hauling, heating, and applying the material.

E. Unsuitable Material

Removal of unsuitable material will be paid for according to the Earthwork Item in the Contract.

Payment will be made under:

Item No. 302	Sand-bituminous stabilized base course material, including material and haul	per cubic yard (meter)
Item No. 302	Sand-bituminous stabilized base course material, including haul	per cubic yard (meter)
Item No. 302	Sand-bituminous stabilized base course, ___ inch (mm)	per square yard (meter)
Item No. 302	Pre-mixed sand-bituminous stabilized base course, including material	per ton (megagram) or per square yard (meter)
Item No. 302	Bituminous materials	per gallon (liter)

302.5.01 Adjustments

General Provisions 101 through 150.

Section 303—Topsoil, Sand-Clay, or Chert Construction

303.1 General Description

This work includes constructing a base, subbase, or shoulder course using topsoil, sand-clay, or chert, stabilized with aggregate, where required.

Construct according to these Specifications and to the lines, grades, and typical cross-sections shown on the Plans or established by the Engineer.

All of the provisions of Section 300 apply to this Item.

303.1.01 Definitions

General Provisions 101 through 150.

303.1.03 Submittals

General Provisions 101 through 150.

303.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Topsoil or Sand-Clay	814.2.01
Stabilizer Aggregates (Type as Specified)	803
Chert	814.2.04
Cutback Asphalt, RC-30, RC-70, RC-250 or MC-30, MC-70, MC-250	821.2.01
Cutback Asphalt Emulsion, CBAE-2	823.2.01
Blotter Material (Sand)	412.3.05.G.3

If an ingredient needs to be added to those naturally present in the roadbed or in any approved source of base, subbase, or shoulder material, obtain it from sources approved by the Engineer. Select sources according to the guidelines of Section 106.

303.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

303.3 Construction Requirements

303.3.01 Personnel

General Provisions 101 through 150.

303.3.02 Equipment

Provide equipment in satisfactory condition for proper construction. Use any applicable equipment specified in Subsection 412.3.02, “Equipment” for bituminous prime.

303.3.03 Preparation

If creating the base, subbase, or shoulder construction entirely with new materials, prepare the subgrade or subbase as specified in Subsection 300.3.03.C, “Preparing the Subgrade” or Subsection 300.3.03.D, “Preparing the Subbase”. Do not place base materials on muddy or frozen subgrade or subbase.

303.3.04 Fabrication

General Provisions 101 through 150.

303.3.05 Construction

A. Roadbed Materials

If the Engineer determines roadbed materials are unsuitable for use, remove and replace them with approved new materials.

If the Engineer determines that roadbed materials are satisfactory, mix, shape, and finish them according to the Specifications.

B. Placing Material

Mix and control the materials according to Subsection 300.3.05.B, “Mining and Mixing in a Pit.” Handle and place materials carefully to prevent fine and coarse materials from separating.

If placing only one kind of material on the prepared subgrade or subbase, or adding only one kind of material to the roadbed to obtain the required mixture, place the material directly on the prepared roadbed and distribute uniformly.

If mixing together materials from more than one outside source, spread them in separate layers to the proper depth. Do this for each separate course, if placing the base in more than one course.

If creating topsoil or sand-clay from artificial mixtures, place the proper proportions of the required ingredients on the roadbed and distribute uniformly.

Use the following steps to spread, mix, and stabilize a base, subbase, or shoulder course.

1. Spreading

Spread material lengthwise up to 2,500 ft (750 m) on the roadbed. If the material is too wet to mix, place additional material as the Engineer requires. Mix as soon as the moisture content reaches the proper level.

2. Mixing

Mix the material by one of the following methods, weather and moisture conditions permitting:

a. Plowing, Harrowing, and Blading

Without disturbing the underlying subgrade or subbase, plow the material to its full depth, then harrow with a disc harrow. Begin plowing both at the edges and the center, alternating back and forth as many times as necessary, to produce a thoroughly pulverized and homogeneous mixture.

b. Traveling Plant

A traveling plant mixer may be used instead of the method described above.

3. Stabilizing

After mixing and shaping the base, subbase, or shoulder course, spread stabilizer aggregate, if specified in the Contract or the Plans.

The quantity of stabilizer material required will be specified in pounds/square yard (kilograms/square meter) of road surface covered. The Department reserves the right to increase, decrease, or eliminate stabilizer material.

Spread and mix stabilizer aggregate with either the upper 4 in (100 mm) or to the full depth of the course, as the Plans indicate. Uniformly incorporate the stabilizer aggregate into the course. Remix and reshape all sections of the course as needed.

When using stabilized subgrade as a base course, either permanently or temporarily (for example, as detours), prime according to Section 412.

C. Compacting and Finishing

Use the following steps to compact and finish a base, subbase, or shoulder course.

1. Moisture Content

Ensure that the moisture content is uniformly distributed and within 90 to 120 percent of optimum. The Engineer will determine the percentage within this range that is appropriate for each job.

2. Compaction

If the base, subbase, or shoulder course is more than 8 in (200 mm) thick, compact it in two courses of equal thickness.

After placing and mixing the material, roll it until the course is uniformly compacted to 100 percent of the maximum dry density.

Complete all courses of any section of construction started in the same day, weather permitting.

a. Single-Course Construction

- 1) Compact the surface by rolling, beginning at least 2 ft (600 mm) outside of its edges.
- 2) Proceed toward the center until the finished surface is smooth, closely knit, and conforms to the proper line, grade, and cross-section.
- 3) Correct any defects according to Subsection 300.3.06.B, "Repairing Defects."

b. Multiple-Course Construction

- 1) After compacting the first course, shape the surface again to line, grade, and cross-section.
- 2) Add water as necessary to develop the proper moisture content.
- 3) Spread and compact the second and any succeeding courses (including stabilizer aggregate, if required) without rolling the first course again.
- 4) Finish the surface according to the procedure specified for Subsection 303.3.05.C.2.a, "Single-Course Construction."

c. Irregular Areas

In places inaccessible to the roller, obtain the required compaction with mechanical tampers approved by the Engineer. Apply the same density requirements as stated above.

D. Protecting the Base, Subbase, or Shoulders

Maintain the course true to grade and cross-section. Until the course cures to the Engineer's satisfaction, keep it free from ruts, ridges, and dust caused by traffic. Roll and add water as needed and repair defects as soon as they appear, as specified in Subsection 300.3.06.B, "Repairing Defects."

E. Priming the Base

After completing the base, apply Bituminous Prime according to Section 412.

If the base is primed before base material classification test results are known, repair and reprime any resulting defective areas at no additional cost to the Department.

303.3.06 Quality Acceptance

A. Compaction Tests

- a. The maximum dry density will be determined from representative samples of compacted material, according to GDT 67 or AASHTO T 99, Method D, where applicable.

- b. The Engineer will determine the in-place density of finished courses according to AASHTOT 191, GDT59, or GDT 21 , where applicable.

B. Finished Surface

- a. Check the finished surface of the base, subbase, or shoulder course transversely. Check the surface by placing a 15 ft (4.5 m) straightedge perpendicular to the centerline, and also by using one of the following tools:
 - A template, cut true to the required cross section and set with a spirit level on non-superelevated sections
 - A system of ordinates, measured from a stringline
 - A surveyor's level
- b. Ensure that ordinates measured from the bottom of the template, stringline, or straightedge to the surface do not exceed 1/2 in (13 mm) at any point. Rod readings shall not deviate more than 0.04 foot (13 mm) from the required readings.
- c. Correct any variations that exceed the requirements immediately, as specified in Subsection 300.3.06.B, "Repairing Defects."

C. Thickness Tolerances

1. Thickness Measurements
 - a. Thickness requirements apply to shoulder construction where the Plans specify a uniform thickness, or where the shoulders will be surfaced.
 - b. Determine the thickness of the base, subbase, or shoulder course, by making as many checks as necessary to determine the average thickness.
2. Deficient Thickness
 - a. If any measurement is deficient in thickness more than 1/2 in (13 mm), make additional measurements to determine the deficient area.
 - b. Correct any area deficient between 1/2 in (13 mm) and 1 in (25 mm) to the design thickness by using one of the following methods according to these Specifications:
 - Add additional quantities of the same materials and reconstruct to the required thickness
 - Leave in place and accept payment for the materials and area (if the course is mixed in place) at 1/2 the Contract Unit Price for the deficient area.
 - c. Correct any area deficient in thickness by more than 1 inch (25 mm) by adding additional quantities of the same material and reconstructing to the required thickness in accordance with these Specifications.
 - f. If payment is made by the cubic yard (meter), payment for additional material to correct deficiencies will be made at the Contract Unit Price with no additional cost to the Department for scarification, mixing or compaction.
 - e. If payment is made by the square yard (meter), no payment will be made for additional material required to correct deficiencies or reconstructing deficient work.
3. Average Thickness
 - a. The average thickness per linear mile (kilometer) is determined from all measurements within the mile (kilometer) increments except the areas deficient by more than 1/2 in (13 mm) and not corrected.
 - b. The average thickness shall not exceed the specified thickness by more than 1/2 in (13 mm).
 - c. If the basis of payment is per cubic yard (meter) for base, subbase, or shoulder, and the average thickness for any mile (kilometer) increment exceeds the allowable 1/2 in (13 mm) tolerance, the excess quantity in that increment will be deducted from the Contractor's payments.
 - d. The excess quantity is calculated by multiplying the average thickness that exceeds the allowable 1/2 in (13 mm) tolerance by the surface area of the base, subbase, or shoulder, as applicable.
 - e. If the basis of payment is per square yard (meter), no deduction will be made for excess thickness.

303.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

303.4 Measurement

A. Topsoil, Sand-Clay, or Chert

Topsoil, sand-clay, or chert is measured by the cubic yard (meter) loose volume, or by the square yard (meter), as specified in Section 109.

B. Stabilizer Aggregate

Stabilizer aggregate is measured by the ton (megagram). Its weight is determined by certified truck scales on the job, or by another certified scale approved in advance by the Engineer.

C. Prime

Bituminous prime is not measured for separate payment.

D. Clearing and Grubbing

When clearing and grubbing is eligible for payment under the provisions of Subsection 106.10, "Local Materials Sources," it is measured by the acre (hectare).

E. Stripping Excavation

When stripping excavation is eligible for payment under the provisions of Section 206 it will be measured using the average end area method as borrow excavation, including material, by the cubic yard (meter).

F. Removing Unsuitable Materials

Unsuitable materials removed are measured and paid for under the Earthwork Item in the Contract.

G. Blending and Remixing

Blending and remixing will be measured by the square yard (meter) as measured on the longitudinal surface, and to the width specified.

303.4.01 Limits

General Provisions 101 through 150.

303.5 Payment

A. Topsoil, Sand-Clay or Chert Base, Subbase, and Shoulder Course

This course will be paid at the Contract Unit Price per cubic yard (meter) or per square yard (meter) as specified for base, subbase, and shoulders, complete, in place, and accepted.

Payment is full compensation for:

- Preparing the roadbed
- Furnishing materials when specified in the Pay Item
- Loading and unloading
- Scarifying, spreading, plowing and harrowing
- Mixing and blending in the pit, in the plant, and in the roadway
- Rolling and shaping

Section 303-Topsoil, Sand-Clay, or Chert Construction

- Watering, maintaining, hauling, and priming

B. Stabilizer Aggregate

Stabilizer aggregate will be paid at the Contract Unit Price per ton (megagram) complete, in place, and accepted. Payment will be full compensation for furnishing materials, loading, hauling, unloading, handling, spreading, scarifying, mixing, watering, shaping, and maintenance.

C. Clearing and Grubbing

Clearing and grubbing eligible for payment under the provisions of Subsection 106.10, "Local Material Sources," will be paid according to Section 202.

D. Stripping Excavation

Stripping excavation eligible for payment under the provisions of Section 206 will be paid according to the same section. Payment will be full compensation for the removal of all materials unsuitable for use in the base, subbase, or shoulder.

E. Priming

Bituminous prime will not be measured for separate payment. Its cost is included in the price bid for base.

Payment will be made under:

Item No. 303	Topsoil, sand-clay, or chert (base, subbase, shoulder) course, class ____ including material	Per cubic yard (meter) or square yard (meter)
Item No. 303	Topsoil, sand-clay, or chert (base, subbase, shoulder) course, class ____	Per cubic yard (meter) or square yard (meter)
Item No. 303	Topsoil, sand-clay, or chert (base and shoulder) course, class ____ including material	Per cubic yard (meter) or square yard (meter)
Item No. 303	Topsoil, sand-clay, or chert (base and shoulder) course, class ____	Per cubic yard (meter) or square yard (meter)
Item No. 303	Stabilizer aggregate, type ____ including material	Per ton (megagram)

303.5.01 Adjustments

General Provisions 101 through 150.

Section 304—Soil Aggregate Construction

304.1 General Description

This work includes constructing base, subbase, or shoulder courses composed of mineral aggregate and soil mortar on prepared subgrade or subbase. Construct according to these Specifications and to the lines, grades, thickness, and cross-sections shown on the Plans or established by the Engineer.

All of the provisions of Section 300 apply to this work.

B. Referenced Documents

GDT 21

GDT 49

GDT 59

304.1.03 Submittals

General Provisions 101 through 150.

304.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Soil Aggregate Base	816.2.01
Soil Mortar for Soil Aggregate Base	816.2.02
Bituminous Prime	412

304.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

304.3 Construction Requirements

304.3.01 Personnel

General Provisions 101 through 150.

304.3.02 Equipment

Provide equipment in satisfactory condition for proper construction. Use any applicable equipment as specified in Subsection 412.3.02, “Equipment” for Bituminous Prime.

304.3.03 Preparation

Prepare the subgrade or subbase as specified in Subsection 300.3.03.C, “Preparing the Subgrade” or Subsection 300.3.03.D, “Preparing the Subbase.” Place soil aggregate materials only on a dry, thawed foundation.

304.3.04 Fabrication

General Provisions 101 through 150.

304.3.05 Construction

A. Methods

1. Use any of the methods of mixing material described in Section 300.
2. In lieu of the methods of mixing described in Section 300 and when approved by the Engineer, use one of the following methods:
 - a. Produce soil aggregate from an approved source or deposit.
 - 1) Produce soil aggregate base that will meet the requirements of this Specification after it has been mined, crushed, and processed.
 - 2) Stockpile the processed material before delivery to the Project.
 - 3) Keep the stockpile large enough during loading operations to ensure that a uniformly blended material is delivered to the Project.
 - 4) Use equipment that will not segregate the material during loading.
 - b. Produce a soil aggregate using in-place operations
 - 1) Mix one material with the existing roadbed materials.
 - 2) Mix two materials on a prepared subgrade.

B. Placing Material

Use the following steps to spread and mix base, subbase, or shoulder course.

1. Spreading and Mixing
 - a. When using soil aggregate base produced from an approved source, uniformly spread the material with an approved mechanical spreader to obtain the desired thickness. Compact and finish according to Subsection 304.3.05.C, “Compacting and Finishing.”
 - b. When in-place operations are required, use the following procedures for either mixing one material with the existing roadbed materials or mixing two materials on a prepared subgrade:
 - 1) Uniformly spread the material with an approved mechanical spreader to obtain the desired thickness when mixing two materials on a prepared subgrade. When mixing only one material with the existing roadbed materials, the material may be dumped directly on the subgrade and spread uniformly.
 - 2) After spreading material, and as soon as weather and moisture conditions permit, mix it by plowing, harrowing, and blading.
 - 3) Without disturbing the underlying subgrade or subbase, plow the material to its full depth, then harrow with a disc harrow.
 - 4) Begin plowing alternately at the edges and the center, back and forth, as many times as necessary to produce a thoroughly pulverized and homogeneous mixture.
 - 5) Compact and finish according to Subsection 304.3.05.C, “Compacting and Finishing.”

C. Compacting and Finishing

Construct courses to the maximum thickness as specified in Subsection 300.3.05.C.5, “Compaction.”

Use the following steps to compact and finish a base, subbase, or shoulder course:

1. Moisture Content

Ensure that the moisture content of materials is uniformly distributed and allows compaction to the specified density. Add sufficient water during the mixing operations to provide the optimum moisture content, ± 2 percentage points.

2. Compaction

After placing and shaping the material to line and grade, compact it to 98 percent of the maximum dry density as determined by representative samples, using GDT 49. When using the material as a base for paved shoulders 6 ft (1.8 m) wide or less, compact to at least 96 percent of the maximum dry density.

a. One-Course Construction

- 1) After compaction, shape to the required grade, line, and cross-section.
- 2) Add water as necessary to develop the proper moisture content.
- 3) Roll until the surface is smooth, closely knit, and free of cracks.
- 4) Correct all defects according to Subsection 300.3.06.B, "Repairing Defects."

b. Multiple Course Construction

- 1) After compacting the first course, shape the surface again to line, grade, and cross-section.
- 2) Add water as necessary to develop the proper moisture content.
- 3) Spread and compact the second and any succeeding courses without rolling the first course again.
- 4) Finish the surface according to the procedure specified for one-course construction.

c. Irregular Areas

In places inaccessible to the roller, obtain the required compaction with mechanical tampers approved by the Engineer.

D. Priming Base

After completing the base, apply bituminous prime according to Section 412.

304.3.06 Quality Acceptance

A. Compaction

Determine the maximum dry density from representative samples of compaction material according to GDT 49. Determine the in-place density according to GDT 21 or GDT 59.

B. Finished Surface

1. Transverse Check

Check the finished surface of the base, subbase, or shoulder course transversely. Using one of the following tools:

- A template, cut true to the required cross-section and set with a spirit level on non-superelevated sections
- A system of ordinates, measured from a stringline
- A surveyor's level

2. Longitudinal Check

Check the surface longitudinally by placing a 15 ft (4.5 m) straightedge parallel to the centerline.

Ensure that ordinates measured from the bottom of the template, stringline, or straightedge to the surface do not exceed 1/4 in (6 mm) at any point. Rod readings shall not deviate more than 0.02 foot (6 mm) from the required readings.

Immediately correct any variations that exceed the requirements, as specified in Subsection 300.3.06.B, "Repairing Defects."

C. Thickness Tolerances

1. Thickness Measurements

- a. Thickness requirements apply to shoulder construction where the Plans specify a uniform thickness, or where the shoulders will be surfaced.
 - b. Determine the thickness of the base, subbase, or shoulder course, by making as many checks as necessary to determine the average thickness.
2. Deficient Thickness
- a. If any measurement is deficient in thickness more than 1/2 in (13 mm), make additional measurements to determine the deficient area.
 - b. Correct any area deficient between 1/2 in (13 mm) and 1 in (25 mm) to the design thickness by using one of the following methods according to Subsection 300.3.06.B.
 - Add additional quantities of the same materials and reconstruct to the required thickness
 - Leave in place and accept payment for the materials and area at 1/2 the Contract Unit Price for the deficient area.
 - c. Correct any area deficient in thickness by more than 1 inch (25 mm) by adding additional quantities of the same material and reconstructing to the required thickness in accordance with Subsection 300.3.06.B.
 - d. No additional payment will be made for correcting deficient thickness.
3. Average Thickness
- a. The average thickness per linear mile (kilometer) is determined from all measurements within the mile (kilometer) increments.
 - b. Do not include in the measurements, any areas that are deficient by more than 1/2 in (13 mm) but less than 1 in (25 mm) and left in place.

D. Priming Base

Prime the completed base according to [Section 412](#).

304.3.07 Contractor Warranty and Maintenance

A. Protecting the Base, Subbase, or Shoulders

Maintain the course until the Engineer determines that it has cured sufficiently and is ready to prime. Maintain by additional wetting, rolling, and blading as necessary. Repair any defects according to Subsection 300.3.06.B, "Repairing Defects."

These protection measures do not relieve the Contractor of maintaining the Work until final acceptance as specified in Section 105.

304.4 Measurement

A. Soil Aggregate Base Course

Soil aggregate base course is measured in square yards (meters) of the specified thickness, as defined in Section 109. The length is measured on the surface along the centerline, and the width as specified on the Plans. Irregular areas, such as turnouts and intersections, are measured to the closest square yard (meter).

Where specified on the Plan, measurements are by the ton (megagram) according to Section 109

B. Soil Mortar

When obtained from a borrow pit, soil mortar for soil aggregate base is measured by the cubic yard (meter) loose volume.

C. Bituminous Prime

Bituminous prime is not measured for separate payment.

Section 304-Soil Stabilized Soil Aggregate Construction

304.4.01 Limits

General Provisions 101 through 150.

304.5 Payment

A. Soil Aggregate Base Course

Soil aggregate base course will be paid at the Contract Unit Price per square yard (meter) of the specified thickness, or per ton (megagram), complete and accepted as defined above including Bituminous Prime.

B. Soil Mortar

When obtained from a borrow pit, soil mortar for soil aggregate base will be paid at the Contract Unit Price per cubic yard (meter), including materials and haul.

C. Bituminous Prime

Bituminous prime will not be paid separately; include its cost in the base course bid price.

Payment will be made under:

Item No. 304	Soil aggregate base course, including materials _____ in (mm)	Per square yard (meter)
Item No. 304	Soil aggregate base course, including materials	Per ton (megagram)
Item No. 304	Soil mortar, including materials	Per cubic yard (meter)

304.5.01 Adjustments

General Provisions 101 through 150.

307.2 Materials

Use the following materials to construct the waterproofing layer (impermeable membrane):

- Cross-laminated, high-density polyethylene film
- Flexible, self-adhesive, rubberized asphalt

Ensure that these materials meet the requirements of Subsection 888.2.03. As an alternative and if approved by the Engineer, use another equal system that has at least a 5-year serviceability record.

307.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

307.3 Construction Requirements

307.3.01 Personnel

General Provisions 101 through 150.

307.3.02 Equipment

General Provisions 101 through 150.

307.3.03 Preparation

General Provisions 101 through 150.

307.3.04 Fabrication

General Provisions 101 through 150.

307.3.05 Construction

A. Installation

Install according to the Plans.

B. Placement

Place the membrane on a soil blanket or cushion at least 6 in (150 mm) thick, that contains material fine enough to pass through a No. 10 (2 mm) sieve. Take care not to form a “slip plane” between the underlying soil and overlying material. Ensure that the membrane is at least 4 ft (1.2 m) wide, with seam strengths at least 95 percent of the membrane strength.

Section 307-Impermeable Membrane for Subgrades, Basins, Ditches, and Canals

C. Protection

During construction, protect the membrane from damage at all times. Remove and replace sections damaged by sunlight, heat, sharp objects, or any other source, at no cost to the Department.

307.3.06 Quality Acceptance

General Provisions 101 through 150.

307.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

307.4 Measurement

Impermeable membrane for subgrades, basins, ditches, and canals is measured by the number of square yards (meters) of subgrade, basins, ditches, and canals.

307.4.01 Limits

Extra, overlapping material required to produce a uniform membrane is not measured.

307.5 Payment

Impermeable membrane for subgrades, basins, ditches, and canals will be paid for at the Contract Unit Price per square yard (meter). This payment will be full compensation for preparing the surfaces, furnishing the membrane system materials, and applying the membrane system.

Payment will be made under:

Item No. 307	Impermeable membrane for subgrades, basins, ditches, and canals	Per square yard (meter)
--------------	---	-------------------------

307.5.01 Adjustments

General Provisions 101 through 150.

Section 310—Graded Aggregate Construction

310.1 General Description

This work includes constructing a base, subbase or shoulder course composed of mineral aggregates. Construct according to these Specifications and to the lines, grades, thickness, and typical cross-sections shown on the Plans or established by the Engineer.

The provisions of Section 300 apply to this work.

310.1.01 Definitions

General Provisions 101 through 150.

310.1.02 Related References

GDT 59

310.1.03 Submittals

General Provisions 101 through 150.

310.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Graded aggregate	815
Cutback asphalt, RC-30, RC-70, RC-250 or MC-30, MC-70, MC-250	821.2.01
Cutback Asphalt Emulsion, CBAE-2	823.2.01
Blotter material (sand)	412.3.05.G.3

310.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

310.3 Construction Requirements

310.3.01 Personnel

General Provisions 101 through 150.

310.3.02 Equipment

Provide equipment in satisfactory condition for proper construction of the base, subbase or shoulder course. Use any applicable equipment specified in Subsection 412.3.02, “Equipment” for Bituminous Prime.

310.3.03 Preparation

Prepare the subgrade or subbase as specified in Subsection 300.3.03.C, “Preparing the Subgrade” or Subsection 300.3.03.D, “Preparing the Subbase.” Place graded aggregate materials only on dry, thawed subgrade or subbase.

310.3.04 Fabrication

General Provisions 101 through 150.

310.3.05 Construction

A. Placing Material

Use the central plant mix method unless producing aggregates (from an approved source or deposit) that conform to the requirements of Section 815.

Use the following steps to mix base and spread subbase or shoulder course.

1. Mixing

When blending two sizes of aggregate, proportion the aggregate and water, if needed, into the central plant. Mix until producing a homogeneous and uniform mixture.

2. Spreading

To obtain the specified thickness, uniformly spread materials to the proper depth with a mixture spreader. Do not use materials containing frost or frozen particles.

a. One-Course Construction

Lay one course to a maximum thickness of 8 in (200 mm) compacted.

b. Multiple-Course Construction

If the thickness of the base, subbase or shoulder course exceeds 8 in (200 mm), construct it in 2 or more courses of equal thickness.

B. Compacting Material

Use the following steps to compact and finish a base, subbase, or shoulder course.

1. Moisture Content

Ensure that the moisture content of materials is uniformly distributed and allows compaction to the specified density.

Unless approved by the Office of Materials, no graded aggregate will be shipped to a project when the moisture content of the material exceeds two percent of optimum moisture.

2. Compaction

After shaping the spread material to line, grade, and cross-section, roll to uniformly compact the course. If using Group 1 aggregate, roll to at least 98 percent of maximum dry density. If using Group 2 aggregate, roll to at least 100 percent of the maximum dry density.

If using graded aggregate mixtures composed of either group as base for paved shoulders 6 ft (1.8 m) wide or less, compact to at least 96 percent of the maximum dry density.

Regardless of compaction, ensure that the compacted base is sufficiently stable to support construction equipment without pumping. If the base material is unstable from too much moisture, dry and rework the base material. Dry and rework the underlying subgrade, if necessary.

a. One-Course Construction

- 1) After compaction, shape to the required grade, line, and cross- section.
- 2) Add water as necessary to develop the proper moisture content.
- 3) Roll until the surface is smooth, closely knit, and free of cracks.
- 4) Correct all defects according to Subsection 300.3.06.B, "Repairing Defects."

b. Multiple-Course Construction

- 1) After compacting the first course, shape the surface again to line, grade, and cross section.
- 2) Add water as necessary to develop the proper moisture content.
- 3) Spread and compact the second and any succeeding courses without rolling the first course again.
- 4) Finish the surface according to the procedure specified for one-course construction.

c. Irregular Areas

In places inaccessible to the roller, obtain the required compaction with mechanical tampers approved by the Engineer. Apply the same density requirements as stated above in Subsection 310.3.05.B.

C. Finishing

Finish the surface of the subbase for Portland cement concrete pavement or the base of asphaltic concrete pavement with automatically controlled screed equipment when required by Subsection 300.3.02.H, "Fine Grading Machine" of the Specifications. Furnish, install, and maintain the sensing wires needed to control the finish operation as a part of the Pay Item. When automatically controlled screed equipment is not required, fine grading with motor graders is permitted.

Finish immediately after the placing and compacting operations. After finishing, compact the subbase again, according to Subsection 310.3.05.B, "Compacting Material."

D. Protecting the Base, Subbase or Shoulders

Maintain the course until the Engineer determines that it has cured sufficiently and is ready to prime. Maintain by additional wetting, rolling, and blading as necessary. Repair any defects according to Subsection 300.3.06.B, "Repairing Defects."

These protection measures do not relieve the Contractor of maintaining the Work until final acceptance as specified in Section 105.

E. Priming the Base

Apply bituminous prime according to Section 412 unless using:

- Graded aggregate base under Portland cement concrete pavement
- Graded aggregate base under asphaltic concrete 5 in (125 mm) or more in total thickness

310.3.06 Quality Acceptance

A. Compaction Tests

1. Determine the maximum dry density from representative samples of compacted material, according to AASHTO T180, Method D.
2. Determine the in-place density of finished courses according to GDT 21 or GDT 59, where applicable.

B. Finished Surface

Check the finished surface of the base, subbase, or shoulder course as follows:

1. Check the longitudinal surface using a 15 ft (4.5 m) straightedge parallel to the centerline.
2. Check the transverse surface by using one of the following tools:
 - A template, cut true to the required cross-section and set with a spirit level on non-superelevated sections
 - A system of ordinates, measured from a stringline
 - A surveyor's level
3. Ensure that ordinates measured from the bottom of the template, stringline, or straightedge, to the surface do not exceed 1/4 in (6 mm) at any point. Rod readings shall not deviate more than 0.02 ft (6 mm) from required readings.
4. Correct any variations from these requirements immediately according to Subsection 300.3.06.B, "Repairing Defects."

C. Thickness Tolerances

1. Thickness Measurements
 - a. Thickness requirements apply to shoulder construction where the Plans specify a uniform thickness, or where the shoulders will be surfaced.
 - b. Determine the thickness of the base, subbase, or shoulder course, by making as many checks as necessary to determine the average thickness.
2. Deficient Thickness
 - a. If any measurement is deficient in thickness more than 1/2 in (13 mm), make additional measurements to determine the deficient area.
 - b. Correct any area deficient between 1/2 in (13 mm) and 1 in (25 mm) to the design thickness by using one of the following methods according to these Specifications:
 - Add additional quantities of the same materials and reconstruct to the required thickness
 - Leave in place and accept payment for the materials and area at 1/2 the Contract Unit Price for the deficient area.

- c. Correct any area deficient in thickness by more than 1 inch (25 mm) by adding additional quantities of the same material and reconstructing to the required thickness in accordance with these Specifications.
- d. If payment is made by the ton (megagram), payment for additional material to correct deficiencies will be made at the Contract Unit Price with no additional cost to the Department for scarification, mixing or compaction.
- e. If payment is made by the square yard (meter), no payment will be made for additional material required to correct deficiencies or for reconstructing deficient work.

3. Average Thickness

- a. The average thickness per linear mile (kilometer) is determined from all measurements within the mile (kilometer) increments except the areas deficient by more than 1/2 in (13 mm) and not corrected.
- b. The average thickness shall not exceed the specified thickness by more than 1/2 in (13 mm).
- c. If the basis of payment is per ton (megagram), and the average thickness for any mile (kilometer) increment exceeds the allowable 1/2 in (13 mm) tolerance, the excess quantity in that increment will be deducted from the Contractor's payments.
- d. The excess quantity is calculated by multiplying the average thickness that exceeds the allowable 1/2 in (13 mm) tolerance by the surface area of the base, subbase, or shoulder.
- e. If the basis of payment is per square yard (meter), no deduction will be made for excess thickness.

310.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

310.4 Measurement

A. Graded Aggregate

Where specified for payment by the ton (megagram), graded aggregate base, subbase or shoulder materials are measured in tons (megagrams), mixed and accepted. When hauling material to the roadway, the actual weight of each loaded vehicle is determined with an approved motor truck scale.

Where specified for payment by the square yard (meter) for a certain thickness, the surface length is measured along the centerline, and the width is specified on the Plans. Measure irregular areas, such as turnouts and intersections, by the square yard (meter).

B. Bituminous Prime

Bituminous prime is not measured for separate payment.

310.4.01 Limits

General Provisions 101 through 150.

310.5 Payment

A. Graded Aggregate

Graded aggregate base, subbase, or shoulder course will be paid for at the Contract Unit Price per ton (megagram) or per square yard (meter), complete, in place, and accepted. This payment shall be full compensation for:

- Materials
- Shaping and compacting the existing roadbed
- Loading, hauling, and unloading
- Crushing and processing
- Mixing
- Spreading

Section 310-Graded Aggregate Construction

- Watering
- Compacting and shaping
- Maintenance
- Priming, when required
- All incidentals necessary to complete The Work

Payment will be made under:

Item No. 310	Graded aggregate (base, subbase, shoulder course)—including material	Per ton (megagram) or square yard (meter)
Item No. 310	Graded aggregate base and shoulder course— including material	Per ton (megagram) or square yard (meter)

310.5.01 Adjustments

General Provisions 101 through 150.

Section 311—Crushed Stone Base

311.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 312—Crushed Rap Base

312.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 316—Cement Stabilized Graded Aggregate Construction

316.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 317—Reconstructed Base Course

317.1 General Description

This work includes reconstructing base courses by:

- Reshaping the existing road surface

- Adding the required amount of new material
- Compacting materials to form a foundation course for other base courses, surface courses, or pavements

Construct base courses according to these Specifications and to the lines, grades, and typical cross-sections shown on the Plans or established by the Engineer.

Apply all of the provisions of Section 300 to this Item.

317.1.01 Definitions

General Provisions 101 through 150.

317.1.02 Related References

B. Referenced Documents

General Provisions 101 through 150.

317.1.03 Submittals

General Provisions 101 through 150.

317.2 Materials

Use materials shown on the Plans or Proposal that conform to the requirements in these Specifications for each type of material.

317.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

317.3 Construction Requirements

317.3.01 Personnel

General Provisions 101 through 150.

317.3.02 Equipment

Provide equipment in satisfactory condition for the proper reconstruction of the base course.

317.3.03 Preparation

General Provisions 101 through 150.

317.3.04 Fabrication

General Provisions 101 through 150.

317.3.05 Construction

A. Methods

With the following methods, bring the existing road surface up to the established grade to conform to the cross-section indicated on the Plans.

1. Remove Unsuitable Material

When existing roadbed material is unsuitable for use, remove and replace it with approved material.

2. Remove and Stockpile Existing Base

If removing roadbed materials to stockpile for further use, as shown on the Plans, follow these steps:

- a. Scarify and pulverize the roadbed to the specified depth, without removing the subgrade or shoulder material.
- b. Deposit material in stockpiles on thoroughly clean surfaces.
- c. Minimize segregation of the separate ingredients when stockpiling the material.

3. Scarify

If leaving roadbed material in place, scarify below the upper surface of the finished base course to a uniform depth, and to the entire width of the finished base course, to:

- a. Eliminate all depressions and irregularities
- b. Allow the bonding of any additional material to the old base
- c. Reshape to the required cross-section

If the surface has been treated with a bituminous material, break it down sufficiently to incorporate into the existing base. If this is impossible, remove it from the base and dispose of it as the Engineer directs.

4. Add New Material

Where unsuitable material has been removed, shape the subgrade or remaining material as directed to add material. Use new material that conforms to the governing Specification.

5. Replace Stockpiled Material

After shaping the subgrade, place stockpiled material along with any additional new material on the roadbed. If the existing roadbed material is satisfactory for use, but deficient in thickness after scarifying, bring the surface to the grade and depth indicated on the Plans by:

- a. Removing all material larger than 3 in (75 mm) in diameter
- b. Adding new material

B. Mix and Shape

After adding the required amount of new material, thoroughly mix the old and new base course. Mix according to the requirements set out under the Specifications for the type of base being constructed. During the mixing and shaping operations, add sufficient quantities of water, if needed, to secure proper moisture conditions.

After mixing, shape the entire roadbed to the required grade and cross-section. Remix and reshape all or any part of the base as necessary, to obtain the desired results.

C. Compact and Finish

After mixing and shaping the base material, compact and finish according to the Specifications for the type of base being reconstructed.

D. Prime

After compaction, preserve the base by priming according to Section 412.

317.3.06 Quality Acceptance

General Provisions 101 through 150.

317.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

317.4 Measurement

A. Base Preparation

Base preparation is measured along the center of the road in miles (kilometers) or in square yards (meters).

B. Removed Unsuitable Material

Removed unsuitable material is measured according to the Earthwork Item in the Contract.

C. Additional Material

Where specified for payment by the cubic yard (meter), the new material added to reconstruct the base is measured by the cubic yard (meter) loose volume as specified in Section 109.

Where specified for payment by the ton (megagram), new material is measured in tons (megagrams), as mixed and accepted. The actual weight is determined by weighing each loaded vehicle with an approved motor truck scale as the material is hauled to the roadway. The actual weight will be the pay weight.

D. Removed, Stockpiled, and Replaced Material

The removal, stockpiling, and replacing of material is measured by the cubic yard (meter) loose volume as specified in Section 109.

E. Prime

Bituminous prime is not measured for separate payment; include it in the price of base preparation.

317.4.01 Limits

General Provisions 101 through 150.

317.5 Payment

A. Removed Unsuitable Material

The removal of unsuitable material will be paid for according to the Earthwork Item in the Contract.

B. Removed and Stockpiled Material

The removal and stockpiling of existing base material will be paid for at the Contract Unit Price per cubic yard (meter). This payment will be full compensation for:

- Scarifying
- Pulverizing
- Loading, hauling, and unloading
- Replacing all existing material from stockpiles

C. Replaced Base Material

The replacement of existing base material from stockpiled materials will be paid for at the Contract Unit Price per cubic yard (meter). This will be full compensation for:

- Loading, hauling, and unloading
- Replacing all existing material from stockpile, as required

D. Base Preparation

The preparation of the base will be paid for at the Contract Unit Price per mile (kilometer) or per square yard (meter). This payment will be full compensation for:

- Scarifying
- Shaping
- All machining necessary to bring the existing road surface to the established grade and to the cross-section shown on the Plans

- Priming

Payment will be made under:

Item No. 317	Additional reconstructed base material	Per cubic yard (meter) or ton (megagram)
Item No. 317	Additional reconstructed base material, including material	Per cubic yard (meter) or ton (megagram)
Item No. 317	Removing and stockpiling existing base material	Per cubic yard (meter)
Item No. 317	Replacing existing base material from stockpile	Per cubic yard (meter)
Item No. 317	Base preparation	Per mile (kilometer) or square yard (meter)

317.5.01 Adjustments

General Provisions 101 through 150.

Section 318—Selected Material Surface Course

318.1 General Description

This work includes constructing a surface course with soil and/or stone. Construct according to these Specifications and to the lines, grades, and typical cross-sections shown on the Plans or established by the Engineer.

Apply the requirements of Section 300 to this Item unless modified by this Specification.

318.1.01 Definitions

General Provisions 101 through 150.

318.1.02 Related References

A. Standard Specifications

- Section 205 – Roadway Excavation
- Section 300—General Specifications for Base and Subbase Courses
- Section 303—Topsoil, Sand-Clay or Chert Construction
- Section 800—Coarse Aggregate
- Section 803—Stabilizer Aggregate
- Section 814—Soil Base Materials
- Section 815—Graded Aggregate

B. Referenced Documents

General Provisions 101 through 150.

318.1.03 Submittals

Submit a “Request for Material Approval.”

318.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Section 318-Selected Material Surface Course

Material	Section
Topsail and Sand Clay	814.2.01
Chert	814.2.04
Graded Aggregate	815.2.01, and notes 1 and 2, below. 815.2.02, and notes 1 and 2, below.
Coarse Aggregate, Size No. 467, 3, or 4	800.2.01
Stabilizer Aggregate (Type as Designated)	803

NOTE 1. Use Subsection 815.2.02, “Unconsolidated Limerock” as aggregate surface course only if the material gradation meets the requirements of Subsection 815.2.01, “Graded Aggregate.”

NOTE 2. When a Project requires an aggregate surface course to be placed and left as a riding surface, use only graded aggregate that meets the requirements of Subsection 815.2.01, “Graded Aggregate.”

A. Satisfactory Material

Use in-place roadbed or driveway material when determined to be acceptable by the Engineer.

B. Unsuitable Material

Remove roadbed materials unsuitable for use as determined by the Engineer.

C. Additional Material

To add materials to those in the roadbed or to build up the surface course entirely, use materials approved by the Engineer.

318.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

318.3 Construction Requirements

318.3.01 Personnel

General Provisions 101 through 150.

318.3.02 Equipment

General Provisions 101 through 150.

318.3.03 Preparation

If constructing the course entirely of new materials, prepare the subgrade as specified in Subsection 300.3.03.C, “Preparing the Subgrade.” If using in-place material, ensure that the surface has been properly shaped. Do not place materials on muddy or frozen subgrade.

318.3.04 Fabrication

General Provisions 101 through 150.

318.3.05 Construction

Spread selected material by approved method to the thickness prescribed on the Plans.

Scarify, mix, and shape the selected material to the required cross section. Roll until the surface is thoroughly compacted, firm, and unyielding. Add water to assist scarifying and compaction.

Where in place materials are approved for use, scarify, mix, shape and compact according to the Specifications for the applicable material.

When stabilizer aggregate is specified, mix it into the surface course according to Subsection 303.3.05.B.3, "Stabilizing."

Where aggregate surface course is specified, spread the specified aggregate or stabilizer material uniformly to the required depth at locations shown on the Plans or as directed by the Engineer.

318.3.06 Quality Acceptance

General Provisions 101 through 150.

318.3.07 Contractor Warranty and Maintenance

Maintain the finished surface course to the required cross section and usable, until the Project is completed and accepted.

318.4 Measurement

A. Selected Material Surface Course

This Item, furnished, complete in place and accepted, is measured by the cubic yard (meter), loose volume as specified in Section 109.

B. In-Place Selected Material Surface Course

This Item is measured in place, on the roadway, in square yards (meters). The actual length is measured along the surface of the surface course, and multiplied by the Plan width. Where this item is on driveways or other irregular areas, the quantity is the actual number of square yards (meters) completed in place and accepted.

C. Stabilizer Aggregate and Aggregate Surface Course

Stabilizer Aggregate and Aggregate Surface Course are measured by the ton (megagram). Their weights are determined with certified truck scales as specified in Section 109.

D. Unsuitable Material

Removed unsuitable material is measured and paid for as Roadway Excavation-Unclassified, Section 205.

318.4.01 Limits

General Provisions 101 through 150.

318.5 Payment

A. Selected Material Surface Course

This item will be paid for at the Contract Unit Price per cubic yard (meter), complete in place and accepted. This payment will be full compensation for:

- Preparing the subgrade
- Furnishing all material
- Loading, hauling, and unloading
- Scarifying
- Pulverizing
- Harrowing
- Spreading
- Mixing, compacting, and shaping
- Maintaining and watering the course

B. In-Place Selected Material Surface Course

This Item, regardless of the depth of material processed, will be paid for at the Contract Unit Price per square yard (meter), complete in place and accepted.

This payment will be full compensation for:

- Scarifying
- Pulverizing
- Harrowing
- Mixing, compacting, and shaping
- Maintaining and watering the course

C. Stabilizer Aggregate

The Stabilizer Aggregate will be paid for at the Contract Unit Price per ton (megagram), complete in place and accepted.

This payment will be full compensation for:

- Furnishing all material
- Loading, hauling, and unloading
- Scarifying
- Spreading, mixing, compacting, and shaping
- Maintaining and watering the course

D. Aggregate Surface Course

Aggregate Surface Course will be paid for at the Contract Unit Price per ton (megagram), complete in place and accepted. This payment will be full compensation for:

- Furnishing all material
- Loading, hauling, and unloading
- Spreading, compacting, and shaping
- Maintaining the course

Payment will be made under:

Item No. 318	Selected materials, surface course	Per cubic yard (meter)
Item No. 318	In-place selected material surface course	Per square yard (meter)
Item No. 318	Aggregate surface course	Per ton (megagram)
Item No. 303	Stabilizer aggregate type ____	Per ton (megagram)

318.5.01 Adjustments

General Provisions 101 through 150.

Section 319—Lime-Fly Ash Soil Construction

319.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 325—Stabilized Base Material for Patching

325.1 General Description

This work includes patching with soil-cement construction, cement stabilized graded aggregate construction, or select material stabilized construction. Construct according to the Plans, the Proposal, or as directed by the Engineer.

325.1.01 Definitions

General Provisions 101 through 150.

325.1.02 Related References

A. Standard Specifications

Section 109—Measurement and Payment

Section 301—Soil-Cement Construction

Section 316—Cement Stabilized Graded Aggregate Construction

Section 412—Bituminous Prime

Section 810 – Roadway Materials

B. Referenced Documents

General Provisions 101 through 150.

325.1.03 Submittals

General Provisions 101 through 150.

325.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Soil-Cement Construction	301
Cement Stabilized Graded Aggregate Construction	316
Bituminous Prime	412
Subgrade Construction	209

Ensure that the subgrade stabilizer-select material meets the requirements of Subsection 810.2.01, “Roadway Materials—Class IIB3” or better. Any special gradation will be specified by a Special Provision.

325.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

325.3 Construction Requirements

Ensure that all labor, equipment, and materials necessary to ensure a continuous patching operation are on hand before patching begins.

325.3.01 Personnel

General Provisions 101 through 150.

325.3.02 Equipment

Provide all the equipment required for the type of patching used.

A concrete mixer with proper weight and moisture control will be considered as a stationary mixing plant for the production of patching material under this Specification.

325.3.03 Preparation

Prepare stabilized base material areas for patching as follows:

1. Trim the sides of the areas to be patched and leave them vertical. Remove all loose material.
2. Remove unsatisfactory material to the depth shown on the Plans or as directed by the Engineer; remove at least 6 in (150 mm) of material.
3. If unsatisfactory material is below a plane that is 1 ft (300 mm) below the existing surface, undercut the area as necessary.
4. Backfill the area with subgrade stabilizer-select material to 1 ft (300 mm) below the existing surface. Use subgrade that meets the requirements of Section 209.

325.3.04 Fabrication

General Provisions 101 through 150.

325.3.05 Construction

Patch during traffic unless otherwise specified. Follow the requirements of Section 301 unless otherwise stated in this Specification.

Patch stabilized base material areas as follows:

1. Thoroughly compact patches at the optimum moisture to at least 100 percent of the maximum laboratory dry density.
2. Compact to the required degree with a conventional steel wheel, pneumatic tired roller, mechanical tampers, or other devices.
3. Lightly spray or mop each patch with bituminous prime. Sand primed areas subject to traffic as directed by the Engineer.

325.3.06 Quality Acceptance

General Provisions 101 through 150.

325.3.07 Contractor Warranty and Maintenance

Repair or replace damaged or destroyed patch at no additional cost to the Department.

325.4 Measurement

A. Base Material

Base material is measured by the cubic yard (meter), loose volume, as specified in Subsection 109.01, "Measurement and Quantities."

B. Subgrade Stabilizer-Select Material

Subgrade stabilizer-select material is measured by the cubic yard (meter), loose volume, as specified in Subsection 109.01, "Measurement and Quantities."

325.4.01 Limits

General Provisions 101 through 150.

325.5 Payment

A. Base Material

The accepted quantity of base material will be paid for at the Contract Unit Price per cubic yard (meter). This payment will be full compensation for:

- Flagging and directing traffic
- Preparing the patched area
- Furnishing material, including Portland cement and bituminous prime
- Loading, unloading, and hauling material
- Crushing
- Processing
- Mixing
- Spreading
- Watering
- Compacting
- Maintaining material

B. Subgrade Stabilizer-Select Material

Subgrade stabilizer-select material will be paid for at the Contract Unit Price per cubic yard (meter) complete in place and accepted. Payment will be full compensation for:

- Removing and disposing asphalt pavements, base materials, and unsatisfactory subgrades
- Furnishing all material
- Loading, hauling, and unloading material
- Mixing
- Compacting
- Finishing
- Watering

Payment will be made under:

Item No. 325	Soil-cement stabilized base course for patching	Per cubic yard (meter)
Item No. 325	Graded aggregate, cement stabilized base for patching	Per cubic yard (meter)
Item No. 325	Subgrade stabilizer-select material for patching	Per cubic yard (meter)

325.5.01 Adjustments

General Provisions 101 through 150.

Section 326—Portland Cement Concrete Subbase

326.1 General Description

This work includes constructing a subbase composed of a mixture of Portland cement and graded aggregate, or Portland cement, aggregate, and sand. Construct according to these Specifications and to the lines, grades, and typical cross-sections shown on the Plans or established by the Engineer.

Apply the requirements of Section 300 to this work.

326.1.01 Definitions

General Provisions 101 through 150.

326.1.03 Submittals

Prior to construction, submit a grade control plan for the Engineer's approval.

326.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Section 326-Portland Cement Concrete Subbase

Material	Specification
Fine Aggregate	801.2.01
Portland Cement	830.2.01
Fly Ash	831.2.03
*Graded Aggregate	815.2.01
Coarse Aggregate	800.2.01
Air Entraining Admixture	831.2.01
Chemical Admixtures for Concrete Type A or D	831.2.02
Curing Compound—White, Wax Base	832.2.03
* The gradation requirements of graded aggregate are modified to require 30 to 45 percent by weight passing the No. 10 (2.0 mm) sieve.	

326.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

326.3 Construction Requirements

326.3.01 Personnel

General Provisions 101 through 150.

326.3.02 Equipment

Provide the equipment and tools necessary to perform this work, including the following.

A. Concrete Batching Equipment

Provide separate bins and weighing hoppers for aggregates and cement in the batching plant. Use separate scales to weigh cement and aggregate.

The Engineer will inspect scales for weighing concrete materials and water measuring devices before their use. Ensure accuracy of scales and water measuring devices of plus or minus 1.0 percent throughout the operating range.

Measure admixtures to an accuracy of plus or minus 3.0 percent.

B. Slip Form Paver and Spreader

To place the subbase mixture, use a self-propelled slip form paver equipped with tracks sufficient to prevent slippage and bogging when loaded.

- Use the paver to strike off, consolidate, and float finish the fresh mixture—all in one pass.
- Operate the paver from a string grade control, or a combination of string control and existing pavement control.
- Use a self-propelled mechanical spreader to distribute the mixture on the grade.

326.3.03 Preparation

Before placing Portland cement concrete subbase, prepare the roadbed as required by the Plans and the Specifications.

326.3.04 Fabrication

General Provisions 101 through 150.

326.3.05 Construction

Produce Portland cement concrete subbase by combining authorized proportions of approved materials in homogeneous, uniform batches.

Ensure that the grade immediately under the subbase does not contribute to deficient thicknesses of either the subbase or pavement. Employ methods to ensure that subbase placement equipment does not cause deficient thickness to areas supporting the equipment.

Produce the subbase as follows:

A. Mixing

The Engineer will determine the design proportions of the required materials based upon mixes prepared in the laboratory or trials performed during construction.

Determine the batch weights required to produce the necessary quantity.

Measure the cement, aggregates, and water separately, to the accuracy specified above. Continue mixing until producing a homogeneous and uniform mixture.

Mix concrete produced in a stationary central mix plant for a minimum of 60 seconds, after all materials have entered the drum. A reduction of mix time may be allowed if representative tests show that the concrete meets the requirements of ASTM C 94, Requirements for Uniformity. In all cases, mix for at least 50 seconds.

Ensure that transit mixed concrete meets the requirements of Subsection 500.3.04.E.3.

B. Placing

Spread the mixture on the grade with minimum rehandling. Hand spread with shovels if necessary. Do not place Portland cement concrete on muddy, puddled, or frozen subgrade.

<p>NOTE: Do not allow workers to walk in fresh concrete with shoes coated with dirt or other foreign substances.</p>

C. Consolidating

Consolidate the mixture by vibrating the full length, width, and depth of the section. Ensure that vibration does not produce puddling or excessive grout accumulation. If consolidation and density are not satisfactory, stop placement and furnish methods or equipment to produce subbase conforming to the Specifications.

D. Finishing

Finish the mixture to the proper cross-section. Use equipment that produces a uniform surface free of irregular, rough, or porous areas. Use a tube float or other finishing device approved by the Engineer to provide a smooth surface. Unless the Engineer permits, do not add water to the surface to aid finishing.

E. Forming Construction Joints

Form a construction joint when mixture placement is interrupted for more than one hour. Construct joints according to Subsection 430.3.05 unless the Engineer waives the requirements concerning reinforcement. Ensure that the straightedge tolerance is 3/8 in (10 mm) in 20 ft (6 m).

F. Curing

Cure the mixture according to Subsection 430.3.05.L.1. Apply compound for the impervious membrane method at the rate of 200 ft²/gal (5 m²/L) or less. Apply a second application of curing compound just before placing the pavement to act as a bond breaker. Apply the second application at the same rate as the first application.

G. Preserving the Subbase

Maintain the subbase until it is covered by the succeeding pavement course.

1. Place the pavement course on the subbase only after the mixture has cured for 7 days.

2. Operate the spreader and slip form paver on the subbase after 7 days, but do not use the subbase as a haul road for loaded trucks, equipment, or other vehicles for 14 days.
 - a. Construct earth ramps and barricades to move traffic across the subbase.
 - b. Remove and replace areas damaged by vehicles or equipment at no additional cost to the Department.

H. Weather Limitations

1. Do not place the subbase mixture when the air temperature in the shade is less than 40 °F (5 °C) and falling. Wait until the air temperature is at least 35 °F (2 °C) and rising.
2. Protect the subbase from rain until the surface has sufficiently hardened to prevent marring.
3. Protect the subbase from cold weather according to Subsection 430.3.05.L.4.

326.3.06 Quality Acceptance

Check the finished surface transversely by a system of ordinates measured from a stringline. Also check the surface with a 20 ft (6 m) straightedge placed parallel to the centerline.

Remove or correct deviations in excess of 3/8 in (10 mm) in 20 ft (6 m). If the Engineer permits, correct low areas by increasing the thickness of the surface course at no additional cost to the Department.

A. Composition of Subbase Mixture

The Department will determine the required proportions based on the test results of sample material. Secure and deliver a sufficient amount of materials to the laboratory for evaluation.

An approved mixture shall conform to the following:

1. Aggregate
Use aggregate that meets the requirements of Subsection 815.2.01. Use aggregates manufactured at the quarry or blended at the plant site to produce the desired results. Place aggregates in one or more stockpiles if the gradation is uniform at the time of batching.
2. Cement
Use at least 275 lbs/yd³ (165 kg/m³) of Portland cement for Portland cement concrete subbase.
Use fly ash as a partial replacement for Portland cement if:
 - a. The quantity of cement replaced is 15 percent or less by weight.
 - b. Cement is replaced by fly ash at the rate of 1.25 lbs to 2 lbs (1.25 kg to 2.0 kg) of fly ash to each pound (kilogram) of cement.Do not use Type IP cement in fly ash mixes.
3. Water-Cement Ratio
The maximum water-cement ratio shall not exceed 1.3. Calculate the water-cement ratio based on the total cement material used, including fly ash.
4. Air Content
Maximum design air content shall be 7.0 percent.
5. Slump
Maximum design slump shall be 1.5 in (40 mm).
6. Compressive Strength
Ensure that the mixture is capable of demonstrating a laboratory compressive strength at 28 days of 1,000 psi (7 MPa) +.18R*. (*Where: R = the difference between the largest observed value and the smallest observed value for all compressive strength specimens at 28 days, for a given combination of materials and mix proportions prepared together.)
Determine compressive strength from the results of six cylinders prepared and tested according to AASHTO: T 126 and T 22.

B. Field Adjustment of Design Proportions

The Engineer will determine changes in design proportions based on construction conditions and notify the Contractor in writing of the effective date and time of the changes.

C. Mix Tolerances

The Engineer will verify that the mix is proportioned according to the approved mix design. Assume responsibility for determining the required batch weights.

Ensure that variations in consistency and air content of the mixture are within the following limits at the time of placement.

1. Consistency

Slump shall not exceed 2 in (50 mm) as determined by GDT 27.

2. Air Content

Air content shall not exceed 8.0 percent, as determined by the applicable test method in GDT 26, GDT 28, or GDT 32.

D. Acceptance of Subbase Mixture

The Department will accept the mixture based upon results required in the Sampling Testing and Inspection Manual for:

- Slump
- Air tests
- Water-cement ratio
- Surveillance of plant operations and mix production

E. Thickness

Determine thickness by taking probe measurements in the fresh mixture every 250 ft (75 m) or less. Adjust the strike off to compensate for variations in thicknesses. Obtain cores to determine the boundaries of areas subject to thickness correction. A construction tolerance of plus or minus 0.5 in (13 mm) from the Plan depth is permitted.

1. Deficient Thickness

Correct areas deficient in thickness by more than 0.5 in (13 mm) but less than 1 in (25 mm) by increasing the surface course depth. Remove or correct areas deficient in thickness by more than 1 in (25 mm) as the Engineer directs.

The Engineer may base the decision to remove or correct the area on a Plan submitted by the Contractor detailing how to obtain the final pavement profile and grade.

2. Excessive Thickness

Remove areas with excessive thickness when the Engineer requires. Removal is not required when the excessive thickness does not result in a surface course deficient in thickness.

326.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

326.4 Measurement

Portland cement concrete subbase is measured by the square yard (meter) as noted in Section 109, complete in place and accepted.

326.4.01 Limits

General Provisions 101 through 150.

326.5 Payment

Portland cement concrete subbase will be paid for at the Contract Unit Price per square yard (meter) for each specified thickness shown on the plans. This payment will be full compensation for:

- Providing Portland cement and all other materials
- Applying first and second applications of curing compound
- Providing all equipment and labor
- Mixing
- Hauling
- Providing other incidentals necessary to complete the Item
- Replacing subbase when required

Payment will be made under:

Item No. 326	Portland cement concrete subbase ____ in (mm) thick	Per square yard (meter)
--------------	---	-------------------------

326.5.01 Adjustments

General Provisions 101 through 150.

Section 327—Mining, Crushing, and Stockpiling Aggregates

327.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 328—Foamed Asphalt Stabilized Base Course

328.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 329—Reclaiming, Crushing And Stockpiling Of Concrete And Asphalt Pavements

329.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 400—Hot Mix Asphaltic Concrete Construction

400.1 General Description

This work includes constructing one or more courses of bituminous plant mixture on the prepared foundation or existing roadway surface. The mixture shall conform with lines, grades, thicknesses, and typical cross sections shown on the Plans or established by the Engineer.

This section includes the requirements for all bituminous plant mixtures regardless of the gradation of the aggregates, type and amount of bituminous material, or pavement use.

Acceptance of work is on a lot-to-lot basis according to the requirements of this Section and Section 106.

400.1.01 Definitions

Segregated Mixture: Mixture lacking homogeneity in HMA constituents of such a magnitude that there is a reasonable expectation of accelerated pavement distress or performance problems. May be quantified by measurable changes in temperature, gradation, asphalt content, air voids, or surface texture.

New Construction: A roadway section more than 0.5 mile (800 m) long that is not longitudinally adjacent to the existing roadway. If one or more lanes are added longitudinally adjacent to the existing lane, the lane(s) shall be tested under the criteria for a resurfacing project. If work is performed on the existing roadway including leveling, grade changes, widening and/or resurfacing then that lane shall be tested under the criteria for a resurfacing project.

Trench Widening: Widening no more than 4 ft. (1.2 m) in width.

Comparison sample: Opposite quarters of material sampled by the Contractor.

Independent Sample (Quality Assurance Sample): A sample taken by the Department to verify an acceptance decision without regard to any other sample that may also have been taken to represent the material in question.

Referee sample: A sample of the material retained during the quartering process which is used for evaluation if a comparison of Contractor and Departmental split sample test results is outside allowable tolerances.

400.1.03 Submittals

A. Invoices

Furnish formal written invoices from a supplier for all materials used in production of HMA when requested by the Department. Show the following on the Bill of Lading:

- Date shipped
- Quantity in tons (megagrams)
- Included with or without additives (for asphalt cement)

Purchase asphaltic cement directly from a supplier listed on **Qualified Products List 7** and provide copies of Bill of Lading at the Department's request.

B. Paving Plan

Before starting asphaltic concrete construction, submit a written paving plan to the Engineer for approval. Include the following on the paving plan:

- Proposed starting date
- Location of plant(s)
- Rate of production
- Average haul distance(s)
- Number of haul trucks
- Paver speed feet (meter)/minute for each placement operation
- Mat width for each placement operation
- Number and type of rollers for each placement operation

- Sketch of the typical section showing the paving sequence for each placement operation
- Electronic controls used for each placement operation
- Temporary pavement marking plan

If staged construction is designated in the Plans or contract, provide a paving plan for each construction stage.

If segregation is detected, submit a written plan of measures and actions to prevent segregation. Work will not continue until the plan is submitted to and approved by the Department.

C. Job Mix Formula

Submit to the Engineer a written job mix formula proposed for each mixture type to be used based on an approved mix design. Furnish the following information for each mix:

- Specific project for which the mixture will be used
- Source and description of the materials to be used
- Mixture I.D. Number
- Proportions of the raw materials to be combined in the paving mixture
- Single percentage of the combined mineral aggregates passing each specified sieve
- Single percentage of asphalt by weight of the total mix to be incorporated in the completed mixture
- Single temperature at which to discharge the mixture from the plant
- Theoretical specific gravity of the mixture at the designated asphalt content
- Name of the person or agency responsible for quality control of the mixture during production

Do the following to have the formulas approved in accordance with SOP 40 "Approval of Contractor Job Mix Formulas" and to ensure their quality:

1. Submit proposed job mix formulas for review at least two weeks before beginning the mixing operations.
2. Do not start hot mix asphaltic concrete work until the Engineer has approved a job mix formula for the mixture to be used. No mixture will be accepted until the Engineer has given approval.
3. Provide mix designs for all SMA, Superpave and 4.75 mm mixes to be used. The Department will provide mix design results for other mixes to be used.
4. After a job mix formula has been approved, assume responsibility for the quality control of the mixtures supplied to the Department according to Subsection 106.01, "Source of Supply and Quantity of Materials."

D. Quality Control Program

Submit a Quality Control Plan to the Office of Materials for approval. The Quality Control Program will be included as part of the certification in the annual plant inspection report.

400.2 Materials

Ensure materials comply with the specifications listed in Table 1.

Table 1—Materials Specifications

Material	Subsection
Asphalt Cement, Grade Specified	820.2
Coarse Aggregates for Asphaltic Concrete	802.2.02
Fine Aggregates for Asphaltic Concrete	802.2.01
Mineral Filler	883.1
Heat Stable Anti-Stripping Additive	831.2.04
Hydrated Lime	882.2.03
Silicone Fluid (When approved by the Office of Materials)	831.2.05
Bituminous Tack Coat: PG 58-22, PG 64-22, PG 67-22	820.2
Hot Mix Asphaltic Concrete Mixtures	828
Fiber Stabilizing Additives	819

When approved by the Office of Materials and required in the Contract, provide Uintaite material, hereafter referred to by the common trade name Gilsonite, as a reinforcing agent for bituminous mixtures. Supply a manufacturer’s certification that the Gilsonite is a granular solid which meets the following requirements:

- | | |
|--|-------------------------|
| Softening Point (AASHTO: T-53) | 300-350 °F (150-175 °C) |
| Specific Gravity, 77 °F (25 °C) (AASHTO: T-228) | 1.04 ± 0.02 |
| Flash Point, COC (AASHTO: T-48) | 550 °F (290 °C) Min. |
| Ash Content (AASHTO: T-111) | 1.0% Max. |
| Penetration, 77 °F (25 °C), 100 gm., 5 sec. (AASHTO: T-49) | 0 |

400.2.01 Delivery, Storage, and Handling

Storage of material is allowed in a properly sealed and insulated system for up to 24 hours except that Stone Matrix Asphalt (SMA), Open-Graded Friction Course (OGFC), or Porous European Mix (PEM) mixtures shall not be stored more than 12 hours. Mixtures other than SMA, OGFC, or PEM may be stored up to 72 hours in a sealed and insulated system, equipped with an auxiliary inert gas system, with the Engineer’s approval. Segregation, lumpiness, drain-down, or stiffness of stored mixture is cause for rejection of the mixture. The Engineer will not approve using a storage or surge bin if the mixture segregates, loses excessive heat, or oxidizes during storage.

The Engineer may obtain mixture samples or recover asphalt cement according to GDT 119. AASHTO T315, AASHTO T 202 and AASHTO T 49 will be used to perform viscosity and penetration tests to determine how much asphalt hardening has occurred.

A. Vehicles for Transporting and Delivering Mixtures

Ensure trucks used for hauling bituminous mixtures have tight, clean, smooth beds.

Follow these guidelines when preparing vehicles to transport bituminous mixtures:

1. Use an approved releasing agent from QPL 39 in the transporting vehicle beds, if necessary, to prevent the mixture from sticking to the bed. Ensure that the releasing agent is not detrimental to the mixture. When applying the agent, drain the excess agent from the bed before loading. Remove from the project any transporting vehicles determined to contain unapproved releasing agents.
2. Protect the mixture with a waterproof cover large enough to extend over the sides and ends of the bed. Securely fasten the waterproof cover before the vehicle begins moving.
3. Insulate the front end and sides of each bed with an insulating material with the following specifications:

- Consists of builders insulating board or equivalent
- Has a minimum “R” value of 4.0
- Can withstand approximately 400 °F (200 °C) temperatures

Install the insulating material so it is protected from loss and contamination. A “Heat Dump Body” may be used in lieu of insulation of the bed. “Heat Dump Body” refers to any approved transport vehicle that is capable of diverting engine exhaust and transmitting heat evenly throughout the dump body to keep asphalt at required temperature. Mark the “Heat Dump Body” clearly with “OPEN” and “CLOSE” position at the exhaust diverter. Install a padlock and lock it in the “OPEN” position when the “Heat Dump Body” is used to transport bituminous mixtures.

4. Mark each transporting vehicle with a clearly visible identification number.
5. Create a hole in each side of the bed so that the temperature of the loaded mixture can be checked. The placement of these holes shall be located to assure that the thermometer is being placed in the hot mix asphaltic concrete.

Ensure the mixture is delivered to the roadway at a temperature within ± 20 °F (± 11 °C) of the temperature on the job mix formula.

If the Engineer determines that a truck may be hazardous to the Project or adversely affect the quality of the work, remove the truck from the project.

B. Containers for Transporting, Conveying, and Storing Bituminous Material

To transport, convey, and store bituminous material, use containers free of foreign material and equipped with sample valves. Bituminous material will not be accepted from conveying vehicles if material has leaked or spilled from the containers.

400.3 Construction Requirements

400.3.01 Personnel

General Provisions 101 through 150.

400.3.02 Equipment

Hot mix asphaltic concrete plants producing mix for Department use are governed by Quality Assurance for Asphaltic Concrete Plants in Georgia, Laboratory Standard Operating Procedure No. 27.

The Engineer will approve the equipment used to transport and construct hot mix asphaltic concrete. Ensure the equipment is in satisfactory mechanical condition and can function properly during production and placement operations. Place the following equipment at the plant or project site:

A. Field Laboratory

Provide a field laboratory according to Section 152.

B. Plant Equipment

1. Scales

Provide scales as follows:

- a. Furnish (at the Contractor’s expense) scales to weigh bituminous plant mixtures, regardless of the measurement method for payment.
- b. Ensure the weight measuring devices that provide documentation comply with Subsection 109.01, “Measurement and Quantities.”
- c. Provide weight devices recording the mixture net weights delivered to the truck when not using platform scales. A net weight system will include, but is not limited to:
 - Hopper or batcher-type weight systems delivering asphaltic mixture directly to the truck
 - Fully automatic batching equipment with a digital recording device
- d. Use a net weight printing system only with automatic batching and mixing systems approved by the Engineer.

- e. Ensure the net weight scale mechanism or device manufacturer, installation, performance, and operation meets the requirements in Subsection 109.01, "Measurement and Quantities"
 - f. Provide information on the Project tickets according to Department of Transportation SOP-15.
2. Time-Locking Devices
- Furnish batch type asphalt plants with automatic time-locking devices controlling the mixing time automatically. Construct these devices to ensure the operator cannot shorten or eliminate any portion of the mixing cycle.
3. Surge- and Storage-Systems
- Provide surge and storage bins as follows:
- a. Ensure bins for mixture storage are insulated and have a working seal, top and bottom, to prevent outside air infiltration and to maintain an inert atmosphere during storage. Bins not intended as storage bins may be used as surge bins to hold hot mixtures for part of the working day. However, empty these surge bins completely at the end of the working day.
 - b. Ensure surge and storage bins can retain a predetermined minimum level of mixture in the bin when the trucks are loaded.
 - c. Ensure surge and storage systems do not contribute to mix segregation, lumpiness, drain-down, or stiffness.
 - d. Ensure the scale mechanism or device manufacture, installation, performance, and operation meets the requirements in subsection 109.01 "Measurement and Quantities".
4. Controls for Dust Collector Fines
- Control dust collection as follows:
- a. When collecting airborne aggregate particles and returning them to the mixture, have the return system meter all or part of the collected dust uniformly into the aggregate mixture and waste the excess. The collected dust percentage returned to the mixture is subject to the Engineer's approval.
 - b. When the collected dust is returned directly to the hot aggregate flow, interlock the dust feeder with the hot aggregate flow and meter the flow to maintain a flow that is constant, proportioned, and uniform.
5. Mineral Filler Supply System
- When mineral filler is required as a mixture ingredient:
- a. Use a separate bin and feed system to store and proportion the required quantity into the mixture with uniform distribution.
 - b. Control the feeder system with a proportioning device meeting these specifications:
 - Is accurate to within ± 10 percent of the filler required
 - Has a convenient and accurate means of calibration
 - Interlocks with the aggregate feed or weigh system to maintain the correct proportions for all rates of production and batch sizes
 - c. Provide flow indicators or sensing devices for the mineral filler system and interlock them with the plant controls to interrupt the mixture production if mineral filler introduction fails to meet the required target value after no longer than 60 seconds.
 - d. Add mineral filler to the mixture as follows, according to the plant type:
 - Batch Type Asphalt Plant. Add mineral filler to the mixture in the weigh hopper.
 - Continuous Plant Using Pugmill Mixers. Feed the mineral filler into the hot aggregate before it is introduced into the mixer to ensure dry mixing is accomplished before the bituminous material is added.
 - Continuous Plants Using the Drier-Drum Mixers. Add the mineral filler to ensure dry mixing is accomplished before the bituminous material is added and ensure the filler does not become entrained into the air stream of the drier.
6. Hydrated Lime Treatment System
- When hydrated lime is required as a mixture ingredient:
- a. Use a separate bin and feed system to store and proportion the required quantity into the mixture.

- b. Ensure the aggregate is uniformly coated with hydrated lime aggregate before adding the bituminous material to the mixture. Ensure the addition of hydrated lime will not become entrained in the exhaust system of the drier or plant.
- c. Control the feeder system with a proportioning device meeting these specifications:
 - Is accurate to within ± 10 percent of the amount required
 - Has a convenient and accurate means of calibration
 - Interlocks with the aggregate feed or weigh system to maintain the correct proportions for all rates of production and batch sizes and to ensure that mixture produced is properly treated with lime
- d. Provide flow indicators or sensing devices for the hydrated lime system and interlock them with the plant controls to interrupt mixture production if hydrated lime introduction fails to meet the required target value after no longer than 60 seconds.

7. Net Weight Weighing Mechanisms

Certify the accuracy of the net weight weighing mechanisms by an approved registered scale serviceperson at least once every 6 months. Check the accuracy of net weight weighing mechanisms at the beginning of Project production and thereafter as directed by the Engineer. Check mechanism accuracy as follows:

- a. Weigh a load on a set of certified commercial truck scales. Ensure that the difference between the printed total net weight and that obtained from the commercial scales is no greater than 4 lbs/1,000 lbs (4 kg/Mg) of load. Check the accuracy of the bitumen scales as follows:
 - Use standard test weights.
 - If the checks indicate printed weights are out of tolerance, have a registered scale serviceperson check the batch scales and certify the accuracy of the printer.
 - While the printer system is out of tolerance and before its adjustment, continue production only if using a set of certified truck scales to determine the truck weights.
- b. Ensure plants using batch scales maintain ten 50 lb (25 kg) standard test weights at the plant site to check batching scale accuracy.
- c. Ensure plant scales that are used only to proportion mixture ingredients, and not to determine pay quantities, are within two percent throughout the range.

8. Fiber Supply System

When stabilizing fiber is required as a mixture ingredient:

- a. Use a separate feed system to store and proportion by weight the required quantity into the mixture with uniform distribution.
- b. Control the feeder system with a proportioning device that meets these Specifications:
 - Is accurate to within ± 10 percent of the amount required. Automatically adjusts the feed rate to maintain the material within this tolerance at all times
 - Has a convenient and accurate means of calibration
 - Provide in-process monitoring, consisting of either a digital display of output or a printout of feed rate, in pounds (kg) per minute, to verify feed rate
 - Interlocks with the aggregate feed or weigh system to maintain the correct proportions for all rates of production and batch sizes
- c. Provide flow indicators or sensing devices for the fiber system and interlock them with the plant controls to interrupt the mixture production if fiber introduction fails or if the output rate is not within the tolerances given above.
- d. Introduce the fiber as follows:
 - When a batch type plant is used, add the fiber to the aggregate in the weigh hopper. Increase the batch dry mixing time by 8 to 12 seconds from the time the aggregate is completely emptied into the mixer to ensure the fibers are uniformly distributed prior to the injection of asphalt cement into the mixer.

- When a continuous or drier-drum type plant is used, add the fiber to the aggregate and uniformly disperse prior to the injection of asphalt cement. Ensure the fibers will not become entrained in the exhaust system of the drier or plant.

9. Crumb Rubber Modifier Supply System

When specified, crumb rubber modifier may be substituted at the Contractor's discretion to produce a PG 76-22 asphaltic cement at the production facility in accordance with Section 820:

- a. Use a separate feed system to store and proportion by weight of the total asphaltic cement, the required percentage of crumb rubber into the mixture.
- b. Control the feeder system with a proportioning device meeting these Specifications:
 - Is accurate to within ± 6 percent of the amount required. Automatically adjusts the feed rate to maintain the material within this tolerance at all times.
 - Has a convenient and accurate means of calibration.
 - Provide in-process monitoring, consisting of either a digital display of output or a printout of feed rate, in pounds per minute, to verify feed rate. The supply system shall report the feed in 1 lb (454 gr.) increments using load cells that will enable the user to monitor the depletion of the modifier. Monitoring the system volumetrically will not be allowed.
 - Interlocks with the aggregate weigh system and asphaltic cement pump to maintain the correct proportions for all rates of production and batch sizes.
- c. Provide flow indicators or sensing devices for the system and interlock them with the plant controls to interrupt the mixture production if the crumb rubber introduction output rate is not within the ± 6 percent tolerance given above. This interlock will immediately notify the operator if the targeted rate exceeds introduction tolerances. All plant production will cease if the introduction rate is not brought back within tolerance after 30 seconds. When the interlock system interrupts production and the plant has to be restarted, upon restarting operations; the modifier system shall run until a uniform feed can be observed on the output display. All mix produced prior to obtaining a uniform feed shall be rejected.
- d. Introduce the crumb rubber modifier as follows:
 - When a batch type plant is used, add the rubber to the aggregate in the weigh hopper. Increase the batch dry mixing time by 15 to 20 seconds from the time the aggregate is completely emptied into the mixer to ensure the modifiers are uniformly distributed prior to the injection of asphalt cement into the mixer. Increase the batch wet mix time by 15 to 20 seconds to ensure the crumb rubber modifier is uniformly blended with the asphaltic cement.
 - When a continuous or drier-drum type plant is used, add the rubber to the aggregate and uniformly disperse prior to the injection of asphalt cement. The point of introduction in the drum mixer will be approved by the Engineer prior to production. Ensure the crumb rubber modifier will not become entrained in the exhaust system of the drier or plant and will not be exposed to the drier flame at any point after induction.
- e. No separate measurement and payment will be made if Contractor elects to utilize crumb rubber.

C. Equipment at Project Site

1. Cleaning Equipment

Provide sufficient hand tools and power equipment to clean the roadway surface before placing the bituminous tack coat. Use power equipment that complies with Subsection 424.3.02.F, "Power Broom and Power Blower."

2. Pressure Distributor

To apply the bituminous tack coat, use a pressure distributor complying with Subsection 424.3.02.B, "Pressure Distributor."

3. Bituminous Pavers

To place hot mix asphaltic concrete, use bituminous pavers that can spread and finish courses that are:

- As wide and deep as indicated on the Plans

- True to line, grade, and cross section
- Smooth
- Uniform in density and texture
- a. Continuous Line and Grade Reference Control. Furnish, place, and maintain the supports, wires, devices, and materials required to provide continuous line and grade reference control to the automatic paver control system.
- b. Automatic Screed Control System. Equip the bituminous pavers with an automatic screed control system actuated from sensor-directed mechanisms or devices that will maintain the paver screed at a pre-determined transverse slope and elevation to obtain the required surface.
- c. Transverse Slope Controller. Use a transverse slope controller capable of maintaining the screed at the desired slope within ± 0.1 percent. Do not use continuous paving set-ups resulting in unbalanced screed widths or off-center breaks in the main screed cross section unless approved by the Engineer.
- d. Screed Control. Equip the paver to permit the following four modes of screed control. The method used shall be approved by the Engineer.
 - Automatic grade sensing and slope control
 - Automatic dual grade sensing
 - Combination automatic and manual control
 - Total manual control

Ensure the controls are referenced with a taut string or wire set to grade, or with a ski-type device or mobile reference at least 30 ft (9 m) long when using a conventional ski. Approved non-contacting laser or sonar-type skis listed on QPL 91 "Georgia's List of Approved Non-contacting Laser and Sonar-type Electronic Grade and Slope Controls" may be used in lieu of conventional 30 ft (9m) skis. Under limited conditions, a short ski or shoe may be substituted for a long ski on the second paver operating in tandem, or when the reference plane is a newly placed adjacent lane.

Automatic screed control is required on all Projects; however, when the Engineer determines that Project conditions prohibit the use of such controls, the Engineer may waive the grade control, or slope control requirements, or both.

- e. Paver Screed Extension. When the laydown width requires a paver screed extension, use bolt-on screed extensions to extend the screeds, or use an approved mechanical screed extension device. When the screed is extended, add auger extensions to assure a length of no more than 18 inches (0.5 m) from the auger to the end gate of the paver. Auger extensions may be omitted when paving variable widths. Ensure the paver is equipped with tunnel extensions when the screed and augers are extended.

<p>NOTE: Do not use extendible strike-off devices instead of approved screed extensions. Only use a strike-off device in areas that would normally be luted in by hand labor.</p>
--

4. Compaction Equipment

Ensure that the compaction equipment is in good mechanical condition and can compact the mixture to the required density. The compaction equipment number, type, size, operation, and condition is subject to the Engineer's approval

5. Materials Transfer Vehicle (MTV)

- a. Use a Materials Transfer Vehicle (MTV) when placing asphaltic concrete mixtures on Projects on the state route system with the following conditions. If a project fails to meet any one of the following conditions, the MTV's use is not required.
 - 1) When to use:
 - The ADT is equal to or greater than 6000,
 - The project length is equal to or greater than 3000 linear feet (915 linear meters),

- The total tonnage (megagrams) of all asphaltic concrete mixtures is greater than 2000 tons (1815 Mg).
- 2) Where to use:
 - Mainline of the traveled way
 - Collector/distributor (C/D) lanes on Interstates and limited access roadways
 - Leveling courses at the Engineer's discretion
 - 3) Do not use the MTV for the following conditions:
 - A resurfacing project that only 9.5 mm mix is required.
 - A project with lane width that is equal or less than 11 feet (3.4 m).
 - A passing lane only project.
 - When noted on the plans.
- b. Ensure the MTV and conventional paving equipment meet the following requirements:
- 1) MTV
 - Has a truck unloading system which receives mixture from the hauling equipment and independently deliver mixtures from the hauling equipment to the paving equipment.
 - Has mixture remixing capability approved by the Office of Materials and is listed on QPL 88 "Georgia's List of Approved Materials Transfer Vehicles".
 - Provides to the paver a homogeneous, non-segregated mixture of uniform temperature with no more than 20 °F (11 °C) difference between the highest and lowest temperatures when measured transversely across the width of the mat in a straight line at a distance of one foot to twenty-five feet (0.3 m to 7.6 m) from the screed while the paver is operating. Ensure that the MTV is capable of providing the paver a consistent material flow that is sufficient to prevent the paver from stopping between truck exchanges.
 - 2) Conventional Paving Equipment
 - Has a paver hopper insert with a minimum capacity of 14 tons (13 Mg) installed in the hopper of conventional paving equipment when an MTV is used.
- c. If the MTV malfunctions during spreading operations, discontinue placement of hot mix asphaltic concrete after there is sufficient hot mix placed to maintain traffic in a safe manner. However, placement of hot mix asphaltic concrete in a lift not exceeding 2 in. (50 mm) may continue until any additional hot mix in transit at the time of the malfunction has been placed. Cease spreading operations thereafter until the MTV is operational.
- d. Ensure the MTV is empty when crossing a bridge and is moved across without any other Contractor vehicles or equipment on the bridge. Move the MTV across a bridge in a travel lane and not on the shoulder. Ensure the speed of the MTV is no greater than 5 mph (8 kph) without any acceleration or deceleration while crossing a bridge.

400.3.03 Preparation

A. Prepare Existing Surface

Prepare the existing surface as follows:

1. Clean the Existing Surface. Before applying hot mix asphaltic concrete pavement, clean the existing surface to the Engineer's satisfaction.
2. Patch and Repair Minor Defects
Before placing leveling course:
 - a. Correct potholes and broken areas requiring patching in the existing surface and base as directed by the Engineer.

- b. Cut out, trim to vertical sides, and remove loose material from the areas to be patched.
 - c. Prime or tack coat the area after being cleaned. Compact patches to the Engineer’s satisfaction. Material for patches does not require a job mix formula, but shall meet the gradation range shown in Section 828. The Engineer must approve the asphalt content to be used.
3. Apply Bituminous Tack Coat
- Apply the tack coat according to Section 413. The Engineer will determine the application rate, which must be within the limitations Table 2.

Table 2—Application Rates for Bituminous Tack, gal/yd² (L/m²)

	Minimum	Maximum
Under OGFC and PEM Mixes	0.06 (0.270)	0.08 (0.360)
All Other Mixes	0.04 (0.180)	0.06(0.270)
*On thin leveling courses and freshly placed asphaltic concrete mixes, reduce the application rate to 0.02 to 0.04 gal/yd ² (0.09 to 0.18 L/m ²).		

B. Place Patching and Leveling Course

1. When the existing surface is irregular, bring the surface area to the proper cross section and grade with a leveling course of hot mix asphaltic concrete materials.
2. Place leveling at the locations and in the amounts directed by the Engineer.
3. Use leveling course mixtures meeting the requirements of the job mix formulas defined in:
 - Subsection 400.3.05.A, “Observe Composition of Mixtures”
 - Section 828
 - Leveling acceptance schedules in Subsection 400.3.06.A, “Acceptance Plans for Gradation and Asphalt Cement Content”
4. If the leveling and patching mix type is undesignated, determine the mix type by the thickness or spread rate according to Table 3, but do not use 4.75 mm mix on interstate projects.

Table 3—Leveling and Patching Mix Types

Thickness	Rate of Spread	Type of Mix
Up to 0.75 in (19 mm)	Up to 85 lbs/yd ² (45 kg/m ²)	4.75 mm Mix or 9.5 mm Superpave Type 1
0.75 to 1.5 in (19 to 38 mm)	85 to 165 lbs/yd ² (45 to 90 kg/m ²)	9.5 mm Superpave Type 2
1.5 to 2 in (38 to 50 mm)	165 to 220 lbs/yd ² (90 to 120 kg/m ²)	12.5 mm Superpave *
2 to 2.5 in (50 to 64 mm)	220 to 275 lbs/yd ² (120 to 150 kg/m ²)	19 mm Superpave *
Over 2.5 in (64 mm)	Over 275 lbs/yd ² (150 kg/m ²)	25 mm Superpave

* These mixtures may be used for isolated patches no more than 6 in. (150 mm) deep and no more than 4 ft. (1.2 m) in diameter or length.

400.3.04 Fabrication

General Provisions 101 through 150.

400.3.05 Construction

Provide the Engineer at least one day’s notice prior to beginning construction, or prior to resuming production if operations have been temporarily suspended.

A. Observe Composition of Mixtures

1. Calibration of plant equipment

If the material changes, or if a component affecting the ingredient proportions has been repaired, replaced, or adjusted, check and recalibrate the proportions.

Calibrate as follows:

- a. Before producing mixture for the Project, calibrate by scale weight the electronic sensors or settings for proportioning mixture ingredients.
- b. Calibrate ingredient proportioning for all rates of production.

2. Mixture control

Compose hot mix asphaltic concrete from a uniform mixture of aggregates, bituminous material, and if required, hydrated lime, mineral filler, or other approved additive.

Ensure the constituents proportional to produce mixtures meeting the requirements in Section 828. The general composition limits prescribed are extreme ranges within which the job mix formula must be established. Base mixtures on a design analysis that meets the requirements of Section 828.

Ensure the field performance of the in-place mixtures meet the requirements of Subsection 828.2B for Permeability, Moisture Susceptibility, Rutting Susceptibility and Fatigue. In-place mix may be evaluated for compliance with Subsection 828.2.B at the discretion of the State Bituminous Construction Engineer under the following conditions:

- Deviates greater than 10 percent on gradation for mixture control sieves from the approved Job Mix Formula based on Acceptance or Independent Samples.
- Deviates greater than 0.7 percent in asphalt cement content from the approved Job Mix Formula based on Acceptance or Independent Samples.
- The calculated mean pavement air voids result in an adjusted pay factor less than 0.80 or any single sub lot result in mean pavement air voids exceeding 10.5 percent.
- Mix produced not using an approved mix design and/or job mix formula.

Remove and replace any material determined to not meet the requirements established in Section 828.2.B at the Contractor's expense.

If control test results show the characteristic tested does not conform to the job mix formula control tolerances given in Section 828, take immediate action to ensure that the quality control methods are effective.

Control the materials to ensure extreme variations do not occur. Maintain the gradation within the composition limits in Section 828.

B. Prepare Bituminous Material

Uniformly heat the bituminous material to the temperature specified in the job mix formula with a tolerance of ± 20 °F (± 11 °C).

C. Prepare the Aggregate

Prepare the aggregate as follows:

1. Heat the aggregate for the mixture, and ensure a mix temperature within the limits of the job mix formula.
2. Do not contaminate the aggregate with fuel during heating.
3. Reduce the absorbed moisture in the aggregate until the asphalt does not separate from the aggregate in the prepared mixture. If this problem occurs, the Engineer will establish a maximum limit for moisture content in the aggregates. When this limit is established, maintain the moisture content below this limit.

D. Prepare the Mixture

Proportion the mixture ingredients as necessary to meet the required job mix formula. Mix until a homogenous mixture is produced.

1. Add Mineral Filler

When mineral filler is used, introduce it in the proper proportions and as specified in Subsection 400.3.02.B.5, “Mineral Filler Supply System.”

2. Add Hydrated Lime

When hydrated lime is included in the mixture, add it at a rate specified in Section 828 and the job mix formula. Use methods and equipment for adding hydrated lime according to Subsection 400.3.02.B.6, “Hydrated Lime Treatment System.”

Add hydrated lime to the aggregate by using Method A or B as follows:

Method A—Dry Form—Add hydrated lime in its dry form to the mixture as follows, according to the type of plant:

- a. Batch Type Asphalt Plant: Add hydrated lime to the mixture in the weigh hopper or as approved and directed by the Engineer.
- b. Continuous Plant Using Pugmill Mixer: Feed hydrated lime into the hot aggregate before it is introduced into the mixer to ensure dry mixing is complete before the bituminous material is added.
- c. Continuous Plant Using Drier-Drum Mixer: Add hydrated lime so to ensure the lime will not become entrained into the air stream of the drier and to ensure thorough dry mixing will be complete before the bituminous material is added.

Method B—Lime/Water Slurry—Add the required quantity of hydrated lime (based on dry weight) in lime/water slurry form to the aggregate. This solution consists of lime and water in concentrations as directed by the Engineer.

Equip the plant to blend and maintain the hydrated lime in suspension and to mix the hydrated lime with the aggregates uniformly in the proportions specified.

3. Add Stabilizing Fiber

When stabilizing fiber is included in the mixture, add stabilizing fiber at a rate specified in Section 819 and the Job Mix Formula. Introduce it as specified in Subsection 400.3.02.B.8, “Fiber Supply System.”

4. Add Gilsonite Modifier

When approved by the Office of Materials and required by the Contract, add the Gilsonite modifier to the mixture at a rate to ensure eight percent by weight of the asphalt cement is replaced by Gilsonite. Use either PG 64-22 or PG 67-22 asphalt cement as specified in Subsection 820.2.01. Provide suitable means to calibrate and check the rate of Gilsonite being added. Introduce Gilsonite modifier by either of the following methods.

- a. For batch type plants, incorporate Gilsonite into the pugmill at the beginning of the dry mixing cycle. Increase the dry mix cycle by a minimum of 10 seconds after the Gilsonite is added and prior to introduction of the asphalt cement. For this method, supply Gilsonite in plastic bags to protect the material during shipment and handling and store the modifier in a waterproof environment. The bags shall be capable of being completely melted and uniformly blended into the combined mixture.

Gilsonite may also be added through a mineral filler supply system as described in Subsection 400.3.02.B.5, “Mineral Filler Supply System.” The system shall be capable of injecting the modifier into the weigh hopper near the center of the aggregate batching cycle so the material can be accurately weighed.

- b. For drum drier plants, add Gilsonite through the recycle ring or through an acceptable means which will introduce the Gilsonite prior to the asphalt cement injection point. The modifier shall be proportionately fed into the drum mixer at the required rate by a proportioning device which shall be accurate within ± 10 percent of the amount required. The entry point shall be away from flames and ensure the Gilsonite will not be caught up in the air stream and exhaust system.

5. Materials from Different Sources

Do not use mixtures prepared from aggregates from different sources intermittently. This will cause the color of the finished pavement to vary.

E. Observe Weather Limitations

Do not mix and place asphaltic concrete if the existing surface is wet or frozen. Do not lay asphaltic concrete OGFC mix or PEM at air temperatures below 60 °F (16 °C). When using a MTV, OGFC mix or PEM may be placed at 55 °F (13 °C) when approved by the Engineer. For other courses, follow the temperature guidelines in the following table:

Table 4—Lift Thickness Table

Lift Thickness	Minimum Temperature
1 in (25 mm) or less	55 °F (13 °C)
1.1 to 2 in (26 mm to 50 mm)	45 °F (8 °C)
2.1 to 3 in (51 mm to 75 mm)	40 °F (4 °C)
3.1 to 4 in (76 mm to 100 mm)	35 °F (2 °C)
4.1 to 8 in (101 mm to 200 mm)	32 °F (0 °C) and rising. Base Material must not be frozen.

F. Perform Spreading and Finishing

Spread and finish the course as follows:

1. Determine the course’s maximum compacted layer thickness by the type mix being used according to Table 5.

Table 5—Maximum Layer Thickness

Mix Type	Minimum Layer Thickness	Maximum Layer Thickness	Maximum Total Thickness
25 mm Superpave	2 1/2 in (64 mm)	4 in (100 mm) *	—
19 mm Superpave	1 3/4 in (44 mm)	3 in (75 mm) *	—
12.5 mm Superpave	1 3/8 in (35 mm)	2 1/2 in (64 mm)**	8 in (200 mm)
9.5 mm Superpave Type 2	1 1/8 in.(28 mm)	1 1/2 in (38 mm)**	4 in (100 mm)
9.5 mm Superpave Type 1	7/8 in (22 mm)	1 1/4 in (32 mm)	4 in (100 mm)
4.75 mm Mix	3/4 in (19 mm)	1 1/8 in (28 mm)	2 in (50 mm)
9.5 mm OGFC	55 lbs/yd ² (30 kg/m ²)	65 lbs/yd ² (36 kg/m ²)	—
12.5 mm OGFC	85 lbs/yd ² (47 kg/m ²)	95 lbs/yd ² (53 kg/m ²)	—
12.5 mm PEM	110 lbs/yd ² (80 kg/m ²)	165 lbs/yd ² (90 kg/m ²)	—
9.5 mm SMA	1 1/8 in (28 mm)	1 1/2 in (38 mm)	4 in (100 mm)
12.5 mm SMA	1 3/8 in (35 mm)	3 in (75 mm)	6 in (150 mm)
19 mm SMA	1 3/4 in (44 mm)	3 in (75 mm)	—
* Allow up to 6 in (150 mm) per lift on trench widening. **Place 9.5 mm Superpave and 12.5 mm Superpave up to 4 in (100 mm) thick for driveway and side road transition.			

2. Unload the mixture into the paver hopper or into a device designed to receive the mixture from delivery vehicles.
3. Except for leveling courses, spread the mixture to the loose depth for the compacted thickness or the spread rate. Use a mechanical spreader true to the line, grade, and cross section specified.
4. For leveling courses, use a motor grader equipped with a spreader box and smooth tires to spread the material or use a mechanical spreader meeting the requirements in Subsection 400.3.02.C, “Equipment at Project Site.”
5. Obtain the Engineer’s approval for the sequence of paving operations, including paving the adjoining lanes. Minimize tracking tack onto surrounding surfaces.
6. Ensure the outside edges of the pavement being laid are aligned and parallel to the roadway center line.
7. For New Construction or Resurfacing Contracts containing multiple lifts or courses, arrange the width of the individual lifts so the longitudinal joints of each successive lift are offset from the previous lift at least 1 ft (300 mm). This requirement does not apply to the lift immediately over thin lift leveling courses.

Ensure the longitudinal joint(s) in the surface course and the mix immediately underneath asphaltic concrete OGFC or PEM are at the lane line(s).

NOTE: Perform night work with artificial light provided by the Contractor and approved by the Engineer.

8. Where mechanical equipment cannot be used, spread and rake the mixture by hand. Obtain the Engineer's approval of the operation sequence, including compactive methods, in these areas.
9. Keep small hand raking tools clean and free from asphalt build up. Do not use fuel oil or other harmful solvents to clean tools during the work.
10. Do not use mixture with any of these characteristics:
 - Segregated
 - Nonconforming temperature
 - Deficient or excessive asphalt cement content
 - Otherwise unsuitable to place on the roadway in the work
11. Remove and replace mixture placed on the roadway that the Engineer determines has unacceptable blemish levels from segregation, raveling, streaking, pulling and tearing, or other deficient characteristics. Replace with acceptable mixture at the Contractor's expense. Do not continually place mixtures with deficiencies.
Do not place subsequent course lifts over another lift or course placed on the same day while the temperature of the previously placed mix is 140 °F (60 °C) or greater.
12. Obtain the Engineer's approval of the material compaction equipment. Perform the rolling as follows:
 - a. Begin the rolling as close behind the spreader as possible without causing excessive distortion of the asphaltic concrete surface.
 - b. Continue rolling until roller marks are no longer visible.
 - c. Use pneumatic-tired rollers with breakdown rollers on all courses except asphaltic concrete OGFC, PEM and SMA or other mixes designated by the Engineer.
13. If applicable, taper or "feather" asphaltic concrete from full depth to a depth no greater than 0.5 in (13 mm) along curbs, gutters, raised pavement edges, and areas where drainage characteristics of the road must be retained. The Engineer will determine the location and extent of tapering.

G. Maintain Continuity of Operations

Coordinate plant production, transportation, and paving operations to maintain a continuous operation. If the spreading operations are interrupted, construct a transverse joint if the mixture immediately behind the paver screed cools to less than 250 °F (120 °C).

H. Construct the Joints

1. Construct Transverse Joints
 - a. Construct transverse joints to facilitate full depth exposure of the course before resuming placement of the affected course.
 - b. Properly clean and tack the vertical face of the transverse joint before placing additional material.

NOTE: Never burn or heat the joint by applying fuel oil or other volatile materials.

- c. Straightedge transverse joints immediately after forming the joint.
 - d. Immediately correct any irregularity that exceeds 3/16 in. in 10 ft (5 mm in 3 m).
2. Construct Longitudinal Joints
Clean and tack the vertical face of the longitudinal joint before placing adjoining material. Construct longitudinal joints so that the joint is smooth, well sealed, and bonded.

3. Construction Joint Detail for OGFC and PEM Mixtures

In addition to meeting joint requirements described above, construct joints and transition areas for 12.5 mm OGFC and 12.5 mm PEM mixtures as follows:

- a. For projects which do not have milling included as a pay item:
 - 1.) Place OGFC mixture meeting gradation requirements of 9.5 mm OGFC as specified in Section 828 on entrance and exit ramp gore areas and end of project construction joints.
 - Taper mixture from 3/8 in (10 mm) at end of project to full plan depth within maximum distance of spread for one load of mixture
 - Taper mixture placed on gore areas from thickness of the edge of the mainline to 3/8 in (10 mm) at the point of the ramp transverse joint.
 - 2.) Construct the ramp transverse joint at the point specified in the plans or as directed by the Engineer.
 - 3.) Mixture placed in the transition and gore areas will be paid for at the contract unit price for 12.5 mm OGFC or 12.5 mm PEM as applicable.
- b. For projects which have milling included as a pay item:
 - 1) Taper milling for a distance of no less than 50 ft (15 m) to a depth of 2 1/4 in (59 mm) at the point of the transverse joint
 - 2) Taper thickness, if needed, of the dense-graded surface mix within the 50 ft (15 m) distance to 1 1/2 in (40 mm) at the point of the transverse joint
 - 3) Taper thickness of the 12.5 mm OGFC or 12.5 mm PEM to 3/4 in (19 mm) to ensure the material ties in at grade level with the existing surface at the point of the transverse joint

I. Protect the Pavement

Protect sections of the newly finished pavement from traffic until the traffic will not mar the surface or alter the surface texture. If directed by the Engineer, use artificial methods to cool the newly finished pavement to open the pavement to traffic more quickly.

J. Modify the Job Mix Formula

If the Engineer determines that undesirable mixture or mat characteristics are being obtained, the job mix formula may require immediate adjustment.

400.3.06 Quality Acceptance

A. Acceptance Plans for Gradation and Asphalt Cement Content

The Contractor will randomly sample and test mixtures for acceptance on a lot basis. The Department will monitor the Contractor testing program and perform comparison and quality assurance testing. The Contractor's Quality Control Technicians shall participate in the Department's Independent Assurance Systems Basis Program.

1. Determine Lot Amount

A lot consists of the tons (megagrams) of asphaltic concrete produced and placed each production day. If this production is less than 500 tons (500 Mg), or its square yard (meter) equivalent, production may be incorporated into the next working day. The Engineer may terminate a lot when a pay adjustment is imminent if a plant or materials adjustment resulting in a probable correction has been made. Terminate all open lots at the end of the month, except for materials produced and placed during the adjustment period. The lot will be terminated as described in Subsection 400.5.01, "Adjustments".

If the final day's production does not constitute a lot, the production may be included in the lot for the previous day's run; or, the Engineer may treat the production as a separate lot with a corresponding lower number of tests.

2. Determine Lot Acceptance

Determine lot acceptance as found in Subsection 400.5.01, "Adjustments."

The Department will perform the following task:

Determine the pay factor by using the mean of the deviations from the job mix formula of the tests in each lot and apply it to Table 9—Mixture Acceptance Schedule for Surface Mixes or Table 10—Mixture Acceptance Schedule for Subsurface Mixes, whichever is appropriate. This mean will be determined by averaging the actual numeric value of the individual deviations from the job mix formula, disregarding whether the deviations are positive or negative amounts. Do not calculate lot acceptance using test results for materials not used in the Work. Determine the pay factor for each lot by multiplying the contract unit price by the appropriate pay factor from the Mixture Acceptance Schedule - Table 9 or Table 10. When two or more pay factors for a specific lot are less than 1.0, determine the adjusted payment by multiplying the contract unit price by the lowest pay factor.

If the mean of the deviations from the job mix formula of the lot acceptance tests for a control sieve or for asphalt cement content exceeds the tolerances established in the appropriate Mixture Acceptance Schedule, and if the Engineer determines that the material need not be removed and replaced, the lot may be accepted at an adjusted unit price as determined by the Engineer. If the Engineer determines that the material is not acceptable to leave in place, the materials shall be removed and replaced at the Contractor's expense.

3. Provide Quality Control Program

Provide a Quality Control Program as established in SOP 27 which includes:

- Assignment of quality control responsibilities to specifically named individuals who have been certified by the Office of Materials
- Provisions for prompt implementation of control and corrective measures
- Provisions for communication with Project Manager, Bituminous Technical Services Engineer, and Testing Management Operations Supervisor at all times
- Provisions for reporting all test results daily through the Office of Materials computerized Field Data Collection System; other checks, calibrations and records will be reported on a form developed by the Contractor and will be included as part of the project records
- Notification in writing of any change in quality control personnel

a. Certification Requirements:

- Use laboratory and testing equipment certified by the Department. (Laboratories which participate in and maintain AASHTO accreditation for testing asphaltic concrete mixtures will be acceptable in lieu of Departmental certification.)
- Provide certified quality control personnel to perform the sampling and testing. A Quality Control Technician (QCT) may be certified at three levels:
 - 1) Temporary Certification – must be a technician trainee who shall be given direct oversight by a certified Level 1 or Level 2 QCT while performing acceptance testing duties during the first 5 days of training. The trainee must complete qualification requirements within 30 Georgia Department of Transportation funded production days after being granted temporary certification. A trainee who does not become qualified within 30 Georgia Department of Transportation funded production days will not be re-eligible for temporary certification. A certified Level 1 or Level 2 QCT shall be at the plant at all times during production and shipment of mixture to monitor work of the temporarily certified technician.
 - 2) Level 1 – must demonstrate they are competent in performing the process control and acceptance tests and procedures related to hot mix asphalt production and successfully pass a written exam.
 - 3) Level 2 – must meet Level 1 requirements and must be capable of and responsible for making process control adjustments, and successfully pass a written exam.
 - Technician certification is valid for 3 years from the date on the technician's certificate unless revoked or suspended. Eligible technicians may become certified through special training and testing approved by the Office of Materials. Technicians who lose their certification due to falsification of test data will not be eligible for recertification in the future unless approved by the State Materials Engineer.

b. Quality Control Management

- 1) Designate at least one Level 2 QCT as manager of the quality control operation. The Quality Control Manager shall meet the following requirements:
 - Be accountable for actions of other QCT personnel

Section 400-Hot Mix Asphaltic Concrete Construction

- Ensure all applicable sampling requirements and frequencies, test procedures, and Standard Operating Procedures are adhered to
 - Ensure all reports, charts, and other documentation is completed as required
- 2) Provide QCT personnel at the plant as follows:
- If daily production for all mix types is to be greater than 250 tons (megagrams), have a QCT person at the plant at all times during production and shipment of mixture until all required acceptance tests have been completed
 - If daily production for all mix types will not be greater than 250 tons (megagrams) a QCT may be responsible for conducting tests at up to two plants, subject to random number sample selection
 - Have available at the plant or within immediate contact by phone or radio a Level 2 QCT responsible for making prompt process control adjustments as necessary to correct the mix
- 3) Sampling, Testing, and Inspection Requirements.
- Provide all sample containers, extractants, forms, diaries, and other supplies subject to approval of the Engineer.
- Perform daily sampling, testing, and inspection of mixture production that meets the following requirements:
- (a) Randomly sample mixtures according to GSP 15, and GDT 73 (Method C) and test on a lot basis. In the event less than the specified number of samples are taken, obtain representative 6 in (150 mm) cores from the roadway at a location where the load not sampled was placed. Take enough cores to ensure minimum sample size requirements are met for each sample needed.
 - (b) Maintain a printed copy of the computer generated random sampling data as a part of the project records.
 - (c) Perform sampling, testing, and inspection duties of GSP 21.
 - (d) Perform extraction or ignition test (GDT 83 or GDT 125) and extraction analysis (GDT 38). If the ignition oven is used, a printout of sample data including weights shall become a part of the project records. For asphalt cement content only, digital printouts of liquid asphalt cement weights may be substituted in lieu of an extraction test for plants with digital recorders. Calculate the asphalt content from the ticket representing the mixture tested for gradation.
 - (e) Save extracted aggregate, opposite quarters, and remaining material (for possible referee testing) of each sample as follows:
 - Store in properly labeled, suitable containers
 - Secure in a protected environment
 - Store for three working days. If not obtained by the Department, within three days they may be discarded in accordance with GSP 21.
 - (f) Add the following information on load tickets from which a sample or temperature check is taken:
 - Mixture temperature
 - Signature of the QCT person performing the testing
 - (g) Calibrate the lime system when hydrated lime is included in the mixture:
 - Perform a minimum of twice weekly during production
 - Post results at the plant for review
 - Provide records of materials invoices upon request (including asphalt cement, aggregate, hydrated lime, etc.)
 - (h) Take action if acceptance test results are outside Mixture Control Tolerances of Section 828.
 - One sample out of tolerance
- (1) Contact Level 2 - QCT to determine if a plant adjustment is needed
- (2) Immediately run a process control sample. Make immediate plant adjustments if this sample is also out of tolerance

NOTE: Determine mixture temperature at least once per hour of production for OGFC and PEM mixes.

- (3) Test additional process control samples as needed to ensure corrective action taken appropriately controls the mixture
 - Two consecutive acceptance samples of the same mix type out of tolerance regardless of Lot or mix design level, or three consecutive acceptance samples out of tolerance regardless of mix type
- (1) Stop plant production immediately
- (2) Reject any mixture in storage:
 - Deviating more than 10 percent in gradation from the job mix formula based on the acceptance sample
 - Deviating more than 0.7 percent in asphalt content from the job mix formula based on the acceptance sample
- (3) Make a plant correction to any mix type out of tolerance prior to resuming production
 - Do not send any mixture to the project before test results of a process control sample meets Mixture Control Tolerances
 - Reject any mixture produced at initial restarting that does not meet Mixture Control Tolerances

4) Comparison Testing and Quality Assurance Program

Periodic comparison testing by the Department will be required of each QCT to monitor consistency of equipment and test procedures. The Department will take independent samples to monitor the Contractor's quality control program.

a) Comparison Sampling and Testing

Retain samples for comparison testing and referee testing if needed as described in Subsection 400.3.06.A.3.b.3. Discard these samples only if the Contractor's acceptance test results meet a 1.00 pay factor and the Department does not procure the samples within three working days.

The Department will test comparison samples on a random basis. Results will be compared to the respective contractor acceptance tests and the maximum difference shall be as follows:

Table 6—Allowable Percent Difference Between Department and Contractor Acceptance Tests

<u>SIEVE SIZE</u>	<u>SURFACE</u>	<u>SUB-SURFACE</u>
1/2 in. (12.5 mm)		4.0%
3/8 in. (9.5 mm)	3.5%	4.0%
No. 4 (4.75 mm)	3.5%	3.5%
No. 8 (2.36 mm)	2.5%	3.0%
No. 200 (75 μm)	2.0%	2.0%
A.C.	0.4%	0.5%

NOTE: Pavement courses to be overlaid with OGFC or PEM mixes are considered surface mixes.

- (1) If test comparisons are within these tolerances:
 - Continue production
 - Use the Contractor's tests for acceptance of the lot

Section 400-Hot Mix Asphaltic Concrete Construction

- (2) If test comparisons are not within these tolerances:
 - Another Departmental technician will test the corresponding referee sample
 - Results of the referee sample will be compared to the respective contractor and Departmental tests using the tolerance for comparison samples given above.
 - a. If referee test results are within the above tolerances when compared to the Contractor acceptance test, use the Contractor's test for acceptance of the effected lot.
 - b. If referee test results are not within the above tolerances when compared to the Contractor acceptance test, the Department will review the Contractor's quality control methods and determine if a thorough investigation is needed.
- b) Independent Verification Sampling and Testing
 - (1) Randomly take a minimum of two independent samples from the lesser of five days or five lots of production regardless of mix type or number of projects.
 - (2) Compare test deviation from job mix formula to Mixture Control Tolerances in Section 828. If results are outside these tolerances, another sample from the respective mix may be taken.

NOTE: For leveling courses less than 110 lb/yd² (60 kg/m²) having quality assurance test results outside the Mixture Control Tolerances of [Section 828](#), use the Department's test results only and applicable pay factors will apply.

If test results of the additional sample are not within Mixture Control Tolerances, the Department will take the following action:

- Take random samples from throughout the subject lot(s) as established in Subsection 400.3.06.A.3.b.3 and use these test results for acceptance and in calculations for the monthly plant rating. Applicable pay factors will apply and the contractor QCT test results will not be included in pay factor calculations nor in the monthly plant rating.
- Determine if the Contractor's quality control program is satisfactory and require prompt corrective action by the Contractor if specification requirements are not being met.
- Determine if the QCT has not followed Departmental procedures or has provided erroneous information.
- Take samples of any in-place mixture represented by unacceptable QCT tests and use the additional sample results for acceptance and in calculations for the monthly plant rating and apply applicable pay factors. The Contractor QCT tests will not be included in the pay factor calculations nor in the monthly plant rating.

B. Compaction

Determine the mixture compaction using either [GDT 39](#) , [GDT 59](#) or AASHTO T 331. The method of GDT 39 for “Uncoated Specimens, Dense Graded Mixtures Only” shall not apply when the water absorption of a sample exceeds 2.0 percent, as measured according to AASHTO T 166. In this case, either AASHTO T 331 or the paraffin method of GDT 39 shall apply. The compaction is accepted in lots defined in [Subsection 400.3.06. A “Acceptance Plans for Gradation and Asphalt Cement Content”](#) and is within the same lot boundaries as the mixture acceptance.

1. Calculate Pavement Mean Air Voids

The Department will calculate the pavement air voids placed within each lot as follows:

- a. One test per sub-lot.
 - Lots \geq 500 ton (500 Mg) of mix shall be divided into 5 sub-lots of equal distance
 - Lots $<$ 500 tons (500 Mg) of mix shall be divided into a sub-lot or equal sub-lots consisting up to 100 tons (100 Mg) mix each. There may be less than 5 sub-lots.
- b. Average the results of all tests run on randomly selected sites in that lot.

c. Select the random sites using GDT 73.

Density tests are not required for asphaltic concrete placed at 90 lbs/yd² (50 kg/m²) or less, 4.75 mm mix, and asphaltic concrete OGFC, PEM and mixes placed as variable depth or width leveling. Compact these courses to the Engineer's satisfaction. Density tests will not be performed on turn-outs and driveways.

The targeted maximum Pavement Mean Air Void content for all Superpave and Stone Matrix Asphalt mixtures is 5.0 percent. Ensure that the maximum Pavement Mean Air Voids for all Superpave and Stone Matrix Asphalt mixtures does not exceed 7.0 percent. The maximum Pavement Mean Air Voids for 2 foot shoulder widening is 9.0 percent. The adjustment period for density shall be four lots or four production days, whichever is less, in order for the contractor to ensure maximum compactive effort has been achieved which will yield no more than the specified maximum allowed Mean Air Voids. If the contractor needs to adjust the mixture to improve density results, a change in the job mix formula may be requested for approval during the adjustment period so long as the following values are not exceeded:

- Coarse pay sieve ± 4%
- No. 8 (2.36 mm) sieve ± 2%
- No. 200 (75 µm) sieve ± 1%
- Asphalt Content ± 0.2%
- All value changes must still be within specification limits

If the Office of Materials is satisfied that the contractor has exerted the maximum compactive effort and is not able to maintain Pavement Mean Air Voids at no more than 7.0%, the Engineer may establish a maximum target for Pavement Mean Air Voids.

Mixture placed during the adjustment period for density shall meet the requirements for a 0.90 pay factor in Table 12 of Subsection 400.5.01.C, "Calculate Mean Pavement Air Voids." Mixture not meeting these density requirements shall be paid for using the applicable pay factor.

If the mean air voids of the pavement placed within a lot exceeds 100% of the maximum target air voids, if established and the Engineer determines that the material need not be removed and replaced, the lot may be accepted at an adjusted unit price as determined by the Engineer.

2. Obtain Uniform Compaction

For a lot to receive a pay factor of 1.00 for compaction acceptance, the air void range cannot exceed 4 percent for new construction or 5 percent for resurfacing projects. The range is the difference between the highest and lowest acceptance test results within the affected lot. If the air void range exceeds these tolerances, apply a Pay Factor of 95%.

The 5% reduced pay factor for the compaction range does not apply in these instances:

- The mixture is placed during the adjustment period as defined in Subsection 400.5.01.A, "Materials Produced and Placed During the Adjustment Period."
- All air void results within a given lot are less than 7.0%.
- A lot containing two subplot or less.
- On two foot trench widening.

C. Surface Tolerance

In this Specification, pavement courses to be overlaid with an Open-Graded Friction Course or PEM are considered surface courses. All Open-Graded Friction Courses or PEM are to be evaluated after the roadway has been opened to traffic for a minimum of 5 days and a maximum of 15 days. Asphalt paving is subject to straightedge and visual inspection and irregularity correction as shown below:

1. Visual and Straightedge Inspection

Paving is subject to visual and straightedge inspection during and after construction operations until Final Acceptance. Locate surface irregularities as follows:

- a. Keep a 10 ft (3 m) straightedge near the paving operation to measure surface irregularities on courses. Provide the straightedge and the labor for its use.

Section 400-Hot Mix Asphaltic Concrete Construction

- b. Inspect the base, intermediate, and surface course surfaces with the straightedge to detect irregularities.
- c. Correct irregularities that exceed 3/16 in. in 10 ft (5 mm in 3 m) for base and intermediate courses, and 1/8 in. in 10 ft (3 mm in 3 m) for surface courses.

Mixture or operating techniques will be stopped if irregularities such as rippling, tearing, or pulling occur and the Engineer suspects a continuing equipment problem. Stop the paving operation and correct the problem. Correct surface course evaluations on individual Laser Road Profiler test sections, normally 1 mile (1 km) long.

2. Target Surface Smoothness

The Department will use the Laser Road Profiler method to conduct acceptance testing for surface course tolerance according to GDT 126. This testing will be performed only on:

- Surface courses on Projects with mainline traveled way measuring a minimum distance of 1 mile (1600 m)
- Ramps more than 0.5 mile (800 m) long

Combine partial sections measuring less than 0.5 mile (800 m) with the previous full mile for acceptance.

Achieve the smoothest possible ride during construction. Do not exceed the target Laser Road Profiler smoothness index as shown below:

Table 7— Pavement Smoothness Target Requirements

Construction Description	Smoothness Index
All Asphaltic Concrete OGFC and PEM on interstate resurfacing and new construction. Asphaltic Concrete OGFC and PEM placed on state route new construction.	750
Asphaltic Concrete SMA and other resurfacing on interstates. Asphaltic Concrete OGFC and PEM placed on state route resurfacing. All new construction on state routes with exception of OGFC and PEM as stated above.	825
All other resurfacing on state routes (excluding LARP, PR, airports, etc.)	900
All Urban new construction and resurfacing on state routes within curb and gutter sections located in posted 35 miles per hour (MPH) or less speed zones.	1175

If the target values are not achieved, immediately adjust the operations to meet the target values. Placement operations may be suspended until a remedial plan to comply with target smoothness requirements is submitted and approved by the Engineer if adjustments do not satisfy target smoothness values.

Table 8— Pavement Smoothness Corrective Work Requirement

Construction Description	Smoothness Index
All Asphaltic Concrete OGFC and PEM placed on interstate resurfacing and new construction. Asphaltic Concrete OGFC and PEM placed on state route new construction.	825
Asphaltic Concrete SMA and other resurfacing on interstates. Asphaltic Concrete OGFC and PEM placed on state route resurfacing. All new construction on state routes with exception of OGFC and PEM as stated above.	900
All other resurfacing on state routes (excluding LARP, PR, airports, etc.)	1025
All Urban new construction and resurfacing on state routes within curb and gutter sections located in posted 35 miles per hour (MPH) or less speed zones.	1250

If surface tolerance deficiencies need correction, obtain the Engineer's approval of the methods and type mix used.

3. Bridge Approach Ride Quality

The following are subject to a ride quality test by the Department for 100 ft. (30 m) of roadway approaching each end of a bridge using the Lightweight Profiler:

- A state road with 4 lanes or more
- A 2-lane state road with a current traffic count of 2,000 vpd or more
- Locations designated on the Plans

All other bridge approaches not meeting the above criteria shall meet the 1/8 in. in 10 ft (3 mm in 3 m) straightedge requirement. When the distance between the ends of two bridges is less than 200 ft (60 m), the bridge approaches will meet the straightedge requirements.

Test ride quality as follows:

- a. The Department will determine a profile index value according to test method GDT 134.
- b. The Department will average the profile index value from the right and left wheelpath for each 100 ft (30 m) section for each lane
 - Resurfacing Projects – Keep the profile index value under 35 in/mile (555 mm/km), correct individual bumps or depression exceeding 0.2 in. (5 mm) from the blanking band on the profilograph trace.
 - All Other Projects – Keep the profile index value under 30 in/mile (475 mm/km), correct individual bumps or depressions exceeding 0.2 in. (5 mm) from blanking band on the profilograph trace.
- c. Meet the profile index value for the 100 ft (30 m) section of roadway up to the joint with the approach slab.
- d. Schedule the ride quality testing 5 days before needed by contacting the Office of Materials. Clean and clear obstructions from the test area.
- e. Correct the sections that do not meet the ride quality criteria of this Specification. After correction, these sections are subject to retesting with the Lightweight Profiler. The Engineer shall direct the type of correction method, which may include:
 - Milling
 - Grinding
 - Removing and replacing the roadway

No additional compensation will be made.

The Department will perform ride quality testing up to two times on the bridge approaches at no cost to the Contractor. Additional profilograph testing will cost the Contractor \$500 per test.

4. Surface Smoothness Acceptance

When recommended by the Office of Materials, a pay reduction may be accepted in lieu of correction for roadways and bridge approaches that fail to achieve specified smoothness indexes.

D. Reevaluation of Lots

When lots are reevaluated as shown in Subsection 106.03, “Samples, Tests, Cited Specifications,” sampling and testing is according to GDT 73. Request for reevaluation shall be made within 5 working days of notification of the lot results.

The following procedures apply:

1. Mixture Acceptance

The Department will take the same number of new tests on cores taken at the locations where the loads sampled were placed and will use only those cores results for acceptance. If the location of the sampled loads cannot be isolated and documented to the approval of the Engineer, the lot will not be re-evaluated and the original test results will be used for acceptance. The Department will use the absolute average deviations from the job mix formula for these tests to determine acceptance based on the appropriate column in the Asphalt Cement Content and Aggregate Gradation of Asphalt Concrete Mixture Acceptance Schedule—Table 9 or 10.

2. Compaction Acceptance

The Department will reevaluate the lot through additional testing by cutting the same number of cores originally obtained and averaging these results with the results from the original density tests. The Department will use the

Section 400-Hot Mix Asphaltic Concrete Construction

average to determine acceptance according to the Compaction Acceptance Schedule in Subsection 400.5.01.C, "Calculate Pavement Mean Air Voids".

Table 9—Mixture Acceptance Schedule—Surface Mixes

E. Segregated Mixture

Prevent mixture placement yielding a segregated mat by following production, storage, loading, placing, and handling procedures. Ensure needed plant modifications and provide necessary auxiliary equipment. (See Subsection 400.1.01, “Definitions.”)

If the mixture is segregated in the finished mat, the Department will take actions based on the degree of segregation. The actions are described below.

1. Unquestionably Unacceptable Segregation

When the Engineer determines the segregation in the finished mat is unquestionably unacceptable, follow these measures:

- a. Suspend Work and require the Contractor to take positive corrective action. The Department will evaluate the segregated areas to determine the extent of the corrective work to the in-place mat as follows:
 - Perform extraction and gradation analysis by taking 6 in (150 mm) cores from typical, visually unacceptable segregated areas.
 - Determine the corrective work according to Subsection 400.3.06.E.3.
- b. Require the Contractor to submit a written plan of measures and actions to prevent further segregation. Work will not continue until the plan is submitted to and approved by the Department.
- c. When work resumes, place a test section not to exceed 500 tons (500 Mg) of the affected mixture for the Department to evaluate. If a few loads show that corrective actions were not adequate, follow the measures above beginning with step 1.a. above. If the problem is solved, Work may continue.

2. Unacceptable Segregation Suspected

When the Engineer observes segregation in the finished mat and the work may be unacceptable, follow these measures:

- a. Allow work to continue at Contractor’s risk.
- b. Require Contractor to immediately and continually adjust operation until the visually apparent segregated areas are eliminated from the finished mat. The Department will immediately investigate to determine the severity of the apparent segregation as follows:
 - Take 6 in (150 mm) cores from typical areas of suspect segregation.
 - Test the cores for compliance with the mixture control tolerances in Section 828.

When these tolerances are exceeded, suspend work for corrective action as outlined in Subsection 400.3.06.E.3.

3. Corrective Work

- a. Remove and replace (at the Contractor’s expense) any segregated area where the gradation on the control sieves is found to vary 10 percent or more from the approved job mix formula, the asphalt cement varies 1.0% or more from the approved job mix formula, or if in-place air voids exceed 13.5% based on GDT 39. The control sieves for each mix type are shown in Subsection 400.5.01.B “Determine Lot Acceptance.”
- b. Subsurface mixes. For subsurface mixes, limit removal and replacement to the full lane width and no less than 10 ft. (3 m) long and as approved by the Engineer.
- c. Surface Mixes. For surface mixes, ensure that removal and replacement is not less than the full width of the affected lane and no less than the length of the affected areas as determined by the Engineer.

Surface tolerance requirements apply to the corrected areas for both subsurface and surface mixes.

400.3.07 Contractor Warranty and Maintenance

A. Contractor’s Record

Maintain a dated, written record of the most recent plant calibration. Keep this record available for the Engineer’s inspection at all times. Maintain records in the form of:

- Graphs
- Tables

- Charts
- Mechanically prepared data

400.4 Measurement

Thickness and spread rate tolerances for the various mixtures are specified in Subsection 400.4.A.2.b, Table 11, Thickness and Spread Rate Tolerance at Any Given Location. These tolerances are applied as outlined below:

A. Hot Mix Asphaltic Concrete Paid for by Weight

1. Plans Designate a Spread Rate

- a. Thickness Determinations. Thickness determinations are not required when the Plans designate a spread rate per square yard (meter).

If the spread rate exceeds the upper limits outlined in the Subsection 400.4.A.2.b, Table 11, “Thickness and Spread Rate Tolerance at Any Given Location”, the mix in excess will not be paid for.

If the rate of spread is less than the lower limit, correct the deficient course by overlaying the entire lot.

The mixture used for correcting deficient areas is paid for at the Contract Unit Price of the course being corrected and is subject to the Mixture Acceptance Schedule—Table 9 or 10.

- b. Recalculate the Total Spread Rate. After the deficient hot mix course has been corrected, the total spread rate for that lot is recalculated, and mix in excess of the upper tolerance limit as outlined in the Subsection 400.4.A.2.b, Table 11, “Thickness and Spread Rate Tolerance at Any Given Location” is not paid for.

The quantity of material placed on irregular areas such as driveways, turnouts, intersections, feather edge section, etc., is deducted from the final spread determination for each lot.

2. Plans Designate Thickness

If the average thickness exceeds the tolerances specified in the Subsection 400.4.A.2.b, Table 11, “Thickness and Spread Rate Tolerance at Any Given Location”, the Engineer shall take cores to determine the area of excess thickness. Excess quantity will not be paid for.

If the average thickness is deficient by more than the tolerances specified in the Thickness and Spread Rate Tolerance at Any Given Location table below, the Engineer shall take additional cores to determine the area of deficient thickness. Correct areas with thickness deficiencies as follows:

- a. Overlay the deficient area with the same mixture type being corrected or with an approved surface mixture. The overlay shall extend for a minimum of 300 ft (90 m) for the full width of the course.
- b. Ensure that the corrected surface course complies with Subsection 400.3.06.C.1, “Visual and Straightedge Inspection.” The mixture required to correct a deficient area is paid for at the Contract Unit Price of the course being corrected.

The mixture is subject to the Mixture Acceptance Schedule—Table 9 or 10 . The quantity of the additional mixture shall not exceed the required calculated quantity used to increase the average thickness of the overlaid section to the maximum tolerance allowed under the following table.

Table 11—Thickness and Spread Rate Tolerance at Any Given Location

Course	Thickness Specified	Spread Rate Specified
Asphaltic concrete base course	± 0.5 in (±13 mm)	+40 lbs, -50 lbs (+20 kg, -30 kg)
Intermediate and/or wearing course	± 0.25 in (± 6 mm)	+20 lbs, -25 lbs (+10 kg, -15 kg)
Overall of any combination of 1 and 2	± 0.5 in (±13 mm)	+40 lbs, -50 lbs (+20 kg, -30 kg)

Note 1: For asphaltic concrete 9.5 mm OGFC and 12.5 mm OGFC, control the spread rate per lot within 5 lbs/yd² (3 kg/m²) of the designated spread rate. For asphaltic concrete 12.5 mm PEM, control the spread rate per lot within 10 lbs/yd² (6 kg/m²) of the designated spread rate.

Note 2: Thickness and spread rate tolerances are provided to allow normal variations within a given lot. Do not continuously operate at a thickness or spread rate not specified.

When the Plans specify a thickness, the Engineer may take as many cores as necessary to determine the average thickness of the intermediate or surface course. The Engineer shall take a minimum of one core per 1,000 ft (300 m) per two lanes of roadway. Thickness will be determined by average measurements of each core according to GDT 42.

If the average exceeds the tolerances specified in the Subsection 400.4.A.2.b, Table 11, “Thickness and Spread Rate Tolerance at Any Given Location”, additional cores will be taken to determine the area of excess thickness and excess tonnage will not be paid for.

B. Hot Mix Asphaltic Concrete Paid for by Square Yard (Meter)

1. The thickness of the base course or the intermediate or surface course will be determined by the Department by cutting cores and the thickness will be determined by averaging the measurements of each core.
2. If any measurement is deficient in thickness more than the tolerances given in the table above, additional cores will be taken by the Department to determine the area of thickness deficiency. Correct thickness deficiency areas as follows:
 - a. Overlay the deficient area with the same type mixtures being corrected or with surface mixture. Extend the overlay at least 300 ft (90 m) for the full width of the course.
 - b. Ensure the corrected surface course complies with Subsection 400.3.06.C.1, Visual and Straightedge Inspection”
 - c. The mixture is subject to the Mixture Acceptance Schedule—Table 9 or 10.
3. No extra payment is made for mixtures used for correction.
4. No extra payment is made for thickness in excess of that specified.

NOTE: Thickness tolerances are provided to allow normal variations within a given lot. Do not continuously operate at a thickness not specified.

C. Asphaltic Concrete

Hot mix asphaltic concrete, complete in place and accepted, is measured in tons (megagrams) or square yards (meters) as indicated in the Proposal. If payment is by the ton (megagram), the actual weight is determined by weighing each loaded vehicle on the required motor truck scale as the material is hauled to the roadway, or by using recorded weights if a digital recording device is used.

The weight measured includes all materials. No deductions are made for the weight of the individual ingredients. The actual weight is the pay weight except when the aggregates used have a combined bulk specific gravity greater than 2.75. In this case the pay weight is determined according to the following formula:

$$T1 = T \times \left\{ \frac{\% AC + \left(\frac{\% \text{ Aggregate} \times 2.75}{\text{combined bulk Specific Gravity}} \right) + \% Y}{100} \right\}$$

Where:

T1	Pay weight, tonnage (Mg)
T=	Actual weight

Section 400-Hot Mix Asphaltic Concrete Construction

% AC=	Percent asphalt cement by weight of total mixture
% Aggregate =	Percent aggregate by weight of total mixture
Combined Bulk Sp. Gr.=	Calculated combined bulk specific gravity of various mineral aggregates used in the mixture
% Y=	Percent hydrated lime by weight of mineral aggregate

D. Bituminous Material

Bituminous material is not measured for separate payment.

E. Hydrated Lime

When hydrated lime is used as an anti-stripping additive, it is not measured for separate payment.

F. Field Laboratory

The field laboratory required in this Specification is not measured for separate payment.

G. Asphaltic Concrete Leveling

Payment of hot mix asphaltic concrete leveling, regardless of the type mix, is full compensation for furnishing materials, bituminous materials, and hydrated lime (when required) for patching and repair of minor defects, surface preparation, cleaning, hauling, mixing, spreading, and rolling.

Mixture for leveling courses is subject to the acceptance schedule as stated in Subsection 400.3.06.A and Subsection 400.3.06.B.

H. Asphaltic Concrete Patching

Hot mix asphaltic concrete patching, regardless of the type mix, is paid for at the Contract Unit Price per ton (Megagram), complete in place and accepted. Payment is full compensation for:

- Furnishing materials such as bituminous material and hydrated lime (when required)
- Preparing surface to be patched
- Cutting areas to be patched, trimmed, and cleaned
- Hauling, mixing, placing, and compacting the materials

400.4.01 Limits

When the asphaltic concrete is paid for by the square yard (meter) and multiple lifts are used, the number and thickness of the lifts are subject to the Engineer's approval and are used to prorate the pay factor for the affected roadway section.

400.5 Payment

When materials or construction are not within the tolerances in this Specification, the Contract Price will be adjusted according to Subsection 106.03, "Samples, Tests, Cited Specifications" and Subsection 400.3.06, "Quality Acceptance."

Hot mix asphaltic concrete of the various types are paid for at the Contract Unit Price per ton (megagram) or per square yard (meter). Payment is full compensation for furnishing and placing materials including asphalt cement, hydrated lime when required, approved additives, and for cleaning and repairing, preparing surfaces, hauling, mixing, spreading, rolling, and performing other operations to complete the Contract Item.

Payment will be made under:

Section 400-Hot Mix Asphaltic Concrete Construction

Item No. 400	Asphaltic concrete <u>type</u> Superpave, <u>group-blend</u> , Including polymer-modified bituminous materials and hydrated lime	Per ton (megagram)
Item No. 400	Asphaltic concrete <u>type</u> , Superpave, <u>group-blend</u> , including bituminous materials and hydrated lime	Per ton (megagram)
Item No. 400	Asphaltic concrete <u>type</u> Superpave, <u>group-blend</u> , Including bituminous materials, Gilsonite modifier, and hydrated lime	Per ton (megagram)
Item No. 400	_____ inches asphaltic concrete, <u>type</u> Superpave, <u>group-blend</u> including bituminous materials, Gilsonite modifier and hydrated lime	Per square yard (meter)
Item No. 400	Asphaltic concrete <u>type</u> Stone Matrix Asphalt, <u>group-blend</u> , including polymer-modified bituminous materials and hydrated lime	Per ton (megagram)
Item No. 400	Asphaltic concrete <u>type</u> OGFC, <u>group 2</u> only, including bituminous materials and hydrated lime	Per ton (megagram)
Item No. 400	Asphaltic concrete <u>type</u> OGFC, <u>group 2</u> only, including polymer-modified bituminous materials and hydrated lime	Per ton (megagram)
Item No. 400	Asphaltic concrete <u>type</u> Porous European Mix, <u>group 2</u> only, including polymer-modified bituminous materials and hydrated lime	Per ton (megagram)

400.5.01 Adjustments

A. Materials Produced and Placed During the Adjustment Period

An adjustment period is allowed at the start of mixing operations for each type of mix placed on the Contract. Asphaltic Concrete OGFC or PEM shall be granted an adjustment period for the first 500 tons (500 Mg) produced for the Contract. A new adjustment period shall not be granted for a change of producer, mix design or asphalt plant location. The adjustment period is provided to adjust or correct the mix and to establish the construction procedures and sequence of operations.

The adjustment period consists of the tons (megagrams) of the affected mix produced and placed on the first day of operation. If this quantity is less than 500 tons (500 Mg), the Engineer may combine the tons (megagrams) produced and placed on the first day of operation with the tons (megagrams) produced and placed on the next production day of the affected mix for the adjustment period.

The material produced and placed during the mixture adjustment period is one lot. If the mix is adjusted during this period, a new lot may be necessary, but a new adjustment period will not be permitted.

This material shall be paid for at 100 percent of the Contract Unit Price provided it meets the minimum requirements for a 1.00 pay factor for asphalt cement content and a 0.90 pay factor for gradation in the Mixture Acceptance Schedule—Table 9 or 10 .

If the material placed during the adjustment period fails to meet the above requirements, it will be paid for using the applicable acceptance schedule. However, when mixture used for leveling at a spread rate of 90 lbs/yd² (50 kg/m²) or less is also used for the surface mix at a spread rate greater than 90 lbs/yd² (50 kg/m²), an additional adjustment period will be allowed for compaction only. This material will be paid for at a 1.00 pay factor provided it:

- Meets the minimum requirements for a 1.00 pay factor in the Mixture Acceptance Schedule—Table 9 or 10 for both asphalt content and gradation.
- Meets the minimum requirements for a 0.90 pay factor in Table 12 of Subsection 400.5.01C, “Calculate Mean Pavement Air Voids.

Mixture which does not meet these requirements shall be paid for using the applicable acceptance schedule.

B. Determine Lot Acceptance

Pay factor adjustments are based on control sieves and asphalt cement content. The control sieves used in the mixture acceptance schedule for the various types of mix are indicated below:

Section 400-Hot Mix Asphaltic Concrete Construction

Control Sieves Used in the Mixture Acceptance Schedule	
Asphaltic concrete 25 mm Superpave	1/2 in., No. 8 (12.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 19 mm SMA	1/2 in., No. 8 (12.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 19 mm Superpave	3/8 in., No. 8 (9.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 12.5 mm Superpave	3/8 in., No. 8 (9.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 12.5 mm SMA	3/8 in., No. 8 (9.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 12.5 mm PEM	3/8 in., No. 8 (9.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 12.5 mm OGFC	3/8 in., No. 8 (9.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 9.5 mm Superpave	No. 4, No. 8 (4.75 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 9.5 mm SMA	No. 4, No. 8 (4.75 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 9.5 mm OGFC	No. 4, No. 8 (4.75 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 4.75 mm Mix	No. 8 (2.36 mm) sieve and asphalt cement

For projects which do not have milling quantities established as a Pay Item, the Department will pay for 12.5 mm OGFC and PEM placed on ramps and end of project transitions under the appropriate mixture pay item, but the mix shall be subject to the same gradation and control sieve requirements as asphaltic concrete 9.5 mm OGFC. Add polymer-modified bituminous material, hydrated lime, and stabilizing fiber to this mix.

The Department will perform the following tasks:

1. Using the Mixture Acceptance Schedule—Table 9 or 10, determine the mean of the deviations from the job mix formula per test results per lot.
2. Determine this mean by averaging the actual numeric value of the individual deviations from the job mix formula; disregard whether the deviations are positive or negative amounts.
3. Use the Asphalt Cement Content and Aggregate Gradation of Asphalt Concrete Mixture Acceptance Schedule—Table 9 to determine acceptance of surface mixes and the Mixture Acceptance Schedule—Table 10 to determine acceptance of subsurface mixes.

On Contracts involving 1,000 tons (1000 Mg) or less of asphaltic concrete, the mixture is accepted for 100 percent payment of the asphaltic concrete Unit Price provided it meets the following:

1. Minimum requirements for a 1.00 pay factor for asphalt cement content and a 0.90 pay factor for gradation in the applicable Mixture Acceptance Schedule—Table 9 or 10.
2. Minimum requirements for a 0.90 pay factor in Table 12 of Subsection 400.5.01C, “Calculate Pavement Mean Air Voids.”

If the material placed on Contracts involving 1,000 tons (1000 Mg) or less of asphaltic concrete does not meet the above requirements, the material will be paid for using the applicable acceptance schedule.

C. Calculate Pavement Mean Air Voids

The Department will determine the percent of maximum air voids for each lot by dividing the pavement mean air voids by the maximum pavement mean air voids acceptable.

The Department will determine the payment for each lot by multiplying the Contract Unit Price by the adjusted pay factor shown in the following Air Voids Acceptance schedule:

Table 12 - Air Voids Acceptance Schedule

Pay Factor	Percent of Maximum Air Voids (Lot Average of Tests)	Percent of Maximum Air Voids (Lot Average all Tests) (for Reevaluations)
1.00	≤100	≤100
0.97	100.1 — 105	100.1 — 104
0.95	105.1 — 112	104.1— 109
0.90	112.1 — 124	109.1 — 118
0.80	124.1 — 149	118.1 — 136
0.70	149.1 —172	136.1 — 153
0.50	172.1 — 191	153.1 — 166

When recommended by the Office of Materials, Lots receiving less than 0.5 pay factor shall be removed and replaced at the Contractor’s expense.

When the range tolerance is exceeded, the Department will apply a pay factor of 0.95 as described in Subsection 400.3.06.B.2.

D. Asphaltic Concrete for Temporary Detours

Hot mix asphaltic concrete placed on temporary detours not to remain in place as part of the permanent pavement does not require hydrated lime. Hot mix used for this purpose is paid for at an adjusted Contract Price. The payment for this item shall cover all cost of construction, maintenance and removal of all temporary mix. Hot mix asphaltic concrete placed as temporary mix shall meet requirements established in Subsection 400.3.05.F.

Where the Contract Price of the asphaltic concrete for permanent pavement is let by the ton (megagram), the Contract Price for the asphaltic concrete placed on temporary detours is adjusted by subtracting \$0.75/ton (\$0.85/mg) of mix used.

Where the Contract price of the mix in the permanent pavement is based on the square yard (meter), obtain the adjusted price for the same mix used on the temporary detour by subtracting \$0.04/yd² (\$0.05/ m²) per 1-in (25-mm) plan depth.

Further price adjustments required in Subsection 400.3.06, “Quality Acceptance,” which are based on the appropriate adjusted Contract Price for mix used in the temporary detour work shall apply should temporary mix be left in place. Hot mix asphalt produced as temporary mix containing no hydrated lime shall be removed and replaced with permanent mix containing hydrated lime.

E. Determine Lot Payment

Determine the lot payment as follows:

1. When one of the pay factors for a specific acceptance lot is less than 1.0, determine the payment for the lot by multiplying the Contract Unit Price by the adjusted pay factor.
2. When two or more pay factors for a specific acceptance lot are less than 1.0, determine the adjusted payment by multiplying the Contract Unit Price by the lowest pay factor.

If the mean of the deviations from the job mix formula of the tests for a sieve or asphalt cement content exceeds the tolerances established in the Mixture Acceptance Schedule—Table 9 or 10 and if the Engineer determines that the material need not be removed and replaced, the lot may be accepted at an adjusted unit price as determined by the Engineer. If the pavement mean air voids exceed the tolerances established in the Air Voids Acceptance Schedule – Table 12, remove and replace the materials at the Contractor’s expense.

If the Engineer determines the material is not acceptable to leave in place, remove and replace the materials at the Contractor’s expense.

Section 401—Cold Mix for Patching

401.1 General Description

This Specification contains requirements for a mixture of mineral aggregates and cutback asphalt suitable for short periods of stockpiling.

401.1.01 Definitions

General Provisions 101 through 150.

401.1.02 Related References

A. Standard Specifications

Section 800—Coarse Aggregate

Section 802—Aggregates for Asphaltic Concrete

Section 820—Asphalt Cement

Section 821—Cutback Asphalt

Section 824—Cationic Asphalt Emulsion

B. Referenced Documents

ASTM D 396

ASTM D 975

401.1.03 Submittals

General Provisions 101 through 150.

401.2 Materials

Ensure that materials meet the following specifications:

Material	Section
Cationic Asphalt Emulsion, CMS-2	824.2.01
Cutback Asphalt, Grade MC-250	821.2.01
Asphalt Cement, PG 64-22	820.2.01
Liquifier, No. 2 Fuel Oil	ASTM D 396
Liquifier, No. 2 Diesel Fuel Oil	ASTMD 975
Fine Aggregate for Asphaltic Concrete	802.2.01
Coarse Aggregate for Asphaltic Concrete	802.2.02

For a list of sources, see QPL 70.

A. Substitutions

Instead of using MC-250 as a bituminous material, a mixture of PG 64-22 and either No. 2 heating fuel oil or No. 2 diesel fuel oil may be used in a blend of 67 percent PG 64-22 and 33 percent fuel oil. Blend these materials before mixing or add them separately when mixing.

B. Composition of Mixtures

Ensure that bituminous cold mixtures are uniform mixtures of aggregate, asphaltic material and, if required, mineral filler.

Ensure that the constituents are proportioned to produce mixtures that meet the requirements given in the Composition Table. Group I aggregate, Group II aggregate, or a blend of both may be used.

Aggregate meeting gradation the requirement for size 89 aggregate in Section 800 may be used instead of composite blends, at the Engineer’s discretion.

Composition Table for Cold Mixes for Bituminous Plant Mixtures for Patching			
Cold Mix Type	12.5 mm Superpave	9.5 mm Superpave (Level B)	9.5 mm Superpave (Level A)
Gradation Requirements, Percent Passing, by Weight			
3/4 in (19 mm) sieve	100		
1/2 in ((12.5 mm) sieve	90 to 100	100	100
3/8 in (9.5 mm) sieve	70 to 89	90 to 100	90 to 100
No. 4 (4.75 mm) sieve		55 to 75	65 to 85
No. 8 (2.36 mm) sieve	34 to 39	42 to 47	53 to 58
No. 50 (300 μm) sieve	8 to 27	8 to 27	10 to 35
No. 200 (75 μm) sieve	3.5 to 7.0	4 to 7	4 to 7
Percent Residual AC, by Weight of Total Mixture	4.3 to 6.5	4.3 to 7.0	4.5 to 7.0

C. Mixing Temperature

The recommended temperatures for aggregate and bituminous materials to ensure proper mixing are as follows:

CMS-2	140-160 °F (60-70 °C)
PG 64-22	300-350 °F (150-175 °C)
MC-250	100-225 °F (40-105° C)
Aggregates	200-225 °F (95-105 °C)

401.2.01 Delivery, Storage, and Handling

A. Stockpiling the Mixture

1. Place the finished mixture in small stockpiles to allow the mixture to cure properly.
2. After curing, stockpile the mixture in one large stockpile if possible.
3. Ensure that the stockpiling area is clean and well drained.

401.3 Construction Requirements

General Provisions 101 through 150.

401.3.01 Personnel

General Provisions 101 through 150.

401.3.02 Equipment

General Provisions 101 through 150.

401.3.03 Preparation

General Provisions 101 through 150.

401.3.04 Fabrication

General Provisions 101 through 150.

401.3.05 Construction

General Provisions 101 through 150.

401.3.06 Quality Acceptance

General Provisions 101 through 150.

401.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

401.4 Measurement

Cold mix will be measured by weight in tons (megagrams) according at Subsection 109.01, “Measurement and Quantities,” and no deductions will be made for the asphalt cement or liquifier.

401.4.01 Limits

General Provisions 101 through 150.

401.5 Payment

Cold mix will be paid for at the Contract Unit Price per ton (megagram). Payment is full compensation for materials costs, production costs, and shall be FOB the stockpile at the plant.

Payment will be made under:

Item No. 401	Cold mix	Per ton (megagram)
--------------	----------	--------------------

401.5.01 Adjustments

General Provisions 101 through 150.

Section 402—Hot Mix Recycled Asphaltic Concrete

402.1 General Description

This work includes producing and placing hot mix recycled asphaltic concrete that incorporates reclaimed asphalt pavement (RAP), reclaimed asphalt shingles (RAS), virgin aggregate, hydrated lime, and neat asphalt cement.

402.1.01 Definitions

General Provisions 101 through 150.

B. Referenced Documents

SOP 41 “Guidelines for RAP Stockpile Approval”

402.1.03 Submittals

A. Certified Weight Tickets

Notify the Engineer before removing RAP from a stockpile that belongs to the Department. Submit to the Engineer the certified weight tickets of materials removed from the stockpile.

B. Affidavit

Submit to the laboratory an affidavit stating the sources of stockpiled materials to be used on a State project. Include the following information in the letter:

- State project number
- Location from which the material was removed
- Approximate removal dates
- Mix types removed and the estimated quantity of each type in the stockpiles
- Other available information about the stockpiled material such as percentage of local sand in the RAP

Obtain specific approval from the laboratory to use RAP or RAS stockpiles.

Adhere to Guidelines for RAP Stockpile Approval.

402.2 Materials

A. RAP Material Composition

Use RAP materials from any of the following:

- Existing roadway
- Contractor’s RAP stockpile that has been approved by the Department
- Department stockpile

NOTE: The location of Department RAP material stockpiles will be given on the Plans.

Do not use RAP materials that contain alluvial gravel or local sand in any mixture placed on interstate projects except for mixtures used in shoulder construction. When used in shoulder construction, limit RAP containing local sand or alluvial gravel so that the sand or gravel contributes no more than 20% of the total aggregate portion of the mix.

1. RAP Percentage

For non-interstate projects, limit the percentage of RAP allowed in recycled mixes so that the overall amount of alluvial gravel does not exceed 5 percent of the total mix. The percentage of alluvial gravel, local sand, and Group I material in the RAP will be determined through petrographic analysis or available records.

2. RAP furnished to the Contractor but not used in the work remains the Contractor’s property.

RAP used in the recycled mixtures for mainline or ramps (if applicable) may make up from 0 to 40 percent of the mixture depending on the amount of RAP available, the production facilities, and whether the mixture meets the requirements in Section 828.

The maximum ratio of RAP material to the recycled mixtures other than SMA is 40 percent for continuous mix type plants and 25 percent for batch type plants. The maximum ratio of RAP material to the recycled mixture is 15 percent for Stone Matrix Asphalt (SMA) mixes.

3. Process RAP Material

Process RAP material to be used in the recycled mixture so that 100 percent will pass the 2 in (50 mm) sieve. Additional crushing and sizing may be required if the RAP aggregate exceeds the maximum sieve size for the mix type as shown in Section 828. Obtain representative materials from the RAP stockpile for the mix design.

B. RAS Material

RAS materials are produced as a by-product of manufacturing roofing shingles and/or discarded shingle scrap from the reroofing of buildings.

1. Limit the amount of RAS material used in the recycled mixture to no greater than 5 percent of the total mixture weight.
2. Shred the RAS material before incorporating it into the mix to ensure that 100 percent of the shredded pieces are less than 1/2 in (12.5 mm) in any dimension.
3. Remove all foreign materials such as paper, roofing nails, wood, or metal flashing.
4. Provide test results for Bulk Sample Analysis, known as Polarized Light Microscopy, if post-consumer shingles are used to certify the RAS material is free of asbestos. Test stockpiles at the rate of one test per 1000 tons (megagrams) prior to processing.

Other than as specifically stated in this Subsection, ensure that RAS material is used according to the same requirements as described for RAP material.

C. Asphaltic Concrete Removed from an Existing Roadway

Asphaltic concrete removed from an existing roadway becomes the Contractor's property unless specified otherwise on the Plans. RAP material retained by the Department is designated on the Plans, and the RAP shall be stockpiled at the location specified on the Plans.

D. Local Sand and Group I Material in RAP

Use of local sand in recycled mixes is restricted as stipulated in Section 828 for the Project. However, RAP which contains local sand may be used in surface and intermediate layers of non-interstate projects so long as the RAP percentage used does not contribute more than 5% local sand to the total aggregate portion of the mix. The amount of local sand in the RAP material shall be considered when determining the percentage of local sand in the total mix.

Where Pay Items specify that Group II only aggregate is to be used, RAP which consists primarily of Group II aggregate, but contains some Group I aggregate, shall be limited such that the Group I aggregate makes up no more than 5% of the total aggregate portion of the mix. When a Blend I mix is specified, any Group I materials in the RAP will be considered when determining the Group I portion allowed in the total mix as specified in Subsection 828.2.A.2.

E. Asphalt Cement

Using laboratory evaluations, the Department will determine the asphalt cement grade to be used in the recycled mixture. The asphalt cement shall meet the requirements of Section 820.

When the asphalt cement is blended with asphalt cement recovered from the RAP material and after tests on residue from thin film oven tests, the asphalt cement shall have a viscosity of 6,000 to 16,000 poises (600 to 1600 Pa) or as approved by the Engineer. Recover asphalt cement from the recycled mixture to verify that the specified viscosity is being met.

If the Engineer determines during construction that the selected asphalt cement grade is not performing satisfactorily, the Department may change the asphalt cement grade in the mixture, with no change in the Contract Unit Price.

F. Recycled Mixture

The recycled mixture shall be a homogenous mixture of RAP or RAS material, virgin aggregate, hydrated lime, and neat asphalt cement. Ensure that the mixture conforms to an approved mixture design outlined in Section 828.

402.2.01 Delivery, Storage, and Handling

Separate the stockpiles by Project sources and by Group I and Group II aggregate types. Erect a sign on each stockpile to identify the source(s).

If RAP material from different project sources becomes intermixed in a stockpile, only use those materials when approved by the laboratory.

The Department may reject by visual inspection stockpiles that are not clean and free of foreign materials.

402.3 Construction Requirements**402.3.01 Personnel**

General Provisions 101 through 150.

402.3.02 Equipment**A. Hot Mix Plant**

Use a hot mix plant for the recycling process with necessary modifications approved by the Engineer to process recycled material. Design, equip, and operate the plant so that the proportioning, heating, and mixing yields a uniform final mixture within the job mix formula tolerances.

B. Cold Feed Bin

Proportion the RAP or RAS material using a separate cold feed bin. Ensure that the material meets the size requirements in Subsection 402.2, "Materials." The ratio of the RAP or RAS to virgin aggregate shall be controlled gravimetrically.

C. Electronic Belt Weighing Devices

Use electronic belt weighing devices to monitor the flow of RAP or RAS and the flow of virgin aggregate. For batch-type plants, the RAP or RAS portion of the mix may be weighed in a weigh hopper before incorporating it into the pugmill. The RAP shall be screened through a 2-inch maximum sized screen prior to crossing the cold feed weigh. Ensure the amount of RAP material incorporated into the asphalt plant does not change after this final measurement is processed by the asphalt plant computer.

D. Feeders and Conveyors

Equip plants with an interlocking system of feeders and conveyors that synchronize the RAP or RAS material flow with the virgin aggregate flow. Ensure that the electronic controls track the flow rates indicated by the belt weighing devices and develop the signal to automatically maintain the desired ratio at varying production rates. Design the RAP or RAS feeder bins, conveyor system, and auxiliary bins (if used) to prevent RAP material from segregating and sticking.

402.3.03 Preparation

General Provisions 101 through 150.

402.3.04 Fabrication

General Provisions 101 through 150.

402.3.05 Construction

Follow the requirements in Section 400 for hot mix recycled asphaltic concrete production and placement, materials, equipment, and acceptance plans except as noted or modified in this Specification.

402.3.06 Quality Acceptance

The Department may require additional quality control tests to determine the RAP stockpile consistency and the RAP aggregate quality. In this case, conduct at least three extraction/gradation tests from each individual source. Ensure that aggregate meets the quality standards in Section 800.

402.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

402.4 Measurement

Recycled asphaltic concrete mixture, complete in place and accepted, is measured in tons (megagrams). The weight is determined by recorded weights if an approved recording device is used. Or, the weight is determined by weighing each loaded vehicle on an approved motor truck scale as the material is hauled to the roadway.

402.4.01 Limits

General Provisions 101 through 150.

402.5 Payment

The work performed and the materials furnished as described in this Specification will be paid for at the Contract Unit Price per ton (megagram). Payment is full compensation for providing materials, hauling and necessary crushing, processing, placing, rolling and finishing the recycled mixture, and providing labor, tools, equipment, and incidentals necessary to complete the work, including hauling and stockpiling RAP or RAS material.

Payment will be made under:

Item No. 402	Recycled asphaltic concrete ___ mm Superpave, group-blend, including bituminous materials	Per ton (megagram)
Item No. 402	Recycled asphaltic concrete ___ mm Superpave, group-blend, including bituminous materials and hydrated lime	Per ton (megagram)
Item No. 402	Recycled asphaltic concrete ___ mm Superpave, group-blend, including polymer-modified bituminous materials and hydrated lime	Per ton (megagram)
Item No. 402	Recycled asphaltic concrete ___ mm Superpave, Type___, group-blend, including bituminous materials and hydrated lime	Per ton (megagram)
Item No. 402	Recycled asphaltic concrete _____ mm mix, group-blend, including bituminous materials and hydrated lime	Per ton (megagram)
Item No. 402	_____in (mm) recycled asphaltic concrete <u>type</u> Superpave, group-blend, including bituminous materials	Per square yard (meter)
Item No. 402	_____in (mm) recycled asphaltic concrete <u>type</u> Superpave, group-blend, including bituminous materials and hydrated lime	Per square yard (meter)
Item No. 402	_____in (mm) recycled asphaltic concrete <u>type</u> Superpave, group-blend, including polymer-modified bituminous materials and hydrated lime	Per square yard (meter)
Item No. 402	_____in (mm) recycled asphaltic concrete _____ mm mix, group-blend, including bituminous materials and hydrated lime	Per square yard (meter)

Item No. 402	Recycled asphaltic concrete patching including bituminous materials and hydrated lime	Per ton (megagram)
Item No. 402	Recycled asphaltic concrete leveling including bituminous materials	Per ton (megagram)

Section 402-Hot Mix Recycled Asphaltic Concrete

Item No. 402	Recycled asphaltic concrete leveling including bituminous materials and hydrated lime	Per ton (megagram)
Item No. 402	Recycled asphaltic concrete type Stone Matrix Asphalt, group-blend, including polymer-modified bituminous materials and hydrated lime	Per ton (megagram)

A. Materials Produced and Placed During the Adjustment Period

An adjustment period is allowed at the start of mixing operations for each type of mix placed on the Contract. A new adjustment period shall not be granted for a change of producer, mix design or asphalt plant location. The adjustment period is provided to adjust or correct the mix and to establish the construction procedures and sequence of operations.

The adjustment period consists of the tons (megagrams) of the affected mix produced and placed on the first day of operation. If this quantity is less than 500 tons (500 Mg), the Engineer may combine the tons (megagrams) produced and placed on the first day of operation with the tons (megagrams) produced and placed on the next production day of the affected mix for the adjustment period.

The material produced and placed during the mixture adjustment period is one lot. If the mix is adjusted during this period, a new lot may be necessary, but a new adjustment period will not be permitted.

This material shall be paid for at 100 percent of the Contract Unit Price provided it meets the minimum requirements for a 1.00 pay factor for asphalt cement content and a 0.90 pay factor for gradation in the Mixture Acceptance Schedule—Table 9 or 10 .

If the material placed during the adjustment period fails to meet the above requirements, it will be paid for using the applicable acceptance schedule. However, when mixture used for leveling at a spread rate of 90 lbs/yd² (50 kg/m²) or less is also used for the surface mix at a spread rate greater than 90 lbs/yd² (50 kg/m²), an additional adjustment period will be allowed for compaction only. This material will be paid for at a 1.00 pay factor provided it:

- Meets the minimum requirements for a 1.00 pay factor in the Mixture Acceptance Schedule—Table 9 or 10 for both asphalt content and gradation.
- Meets the minimum requirements for a 0.90 pay factor in Table 12 of Subsection 400.5.01C, “Calculate Mean Pavement Air Voids.”

Mixture which does not meet these requirements shall be paid for using the applicable acceptance schedule.

B. Determine Lot Acceptance

Pay factor adjustments are based on control sieves and asphalt cement content. The control sieves used in the mixture acceptance schedule for the various types of mix are indicated below:

Control Sieves Used in the Mixture Acceptance Schedule	
Asphaltic concrete 25 mm Superpave	1/2 in., No. 8 (12.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 19 mm SMA	1/2 in., No. 8 (12.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 19 mm Superpave	3/8 in., No. 8 (9.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 12.5 mm Superpave	3/8 in., No. 8 (9.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 12.5 mm SMA	3/8 in., No. 8 (9.5 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 9.5 mm Superpave	No. 4, No. 8 (4.75 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 9.5 mm SMA	No. 4, No. 8 (4.75 mm, 2.36 mm) sieves and asphalt cement
Asphaltic concrete 4.75 mm Mix	No. 8 (2.36 mm) sieve and asphalt cement

The Department will perform the following tasks:

Section 402-Hot Mix Recycled Asphaltic Concrete

1. Using the [Mixture Acceptance Schedule—Table 9 or 10](#), of [Subsection 400.3.06](#) to determine the mean of the deviations from the job mix formula per test results per lot.
2. Determine this mean by averaging the actual numeric value of the individual deviations from the job mix formula; disregard whether the deviations are positive or negative amounts.
3. Use the Asphalt Cement Content and Aggregate Gradation of Asphalt Concrete [Mixture Acceptance Schedule—Table 9 or 10](#) of [Subsection 400.3.06](#) to determine acceptance of surface mixes and the [Mixture Acceptance Schedule—Table 10](#) of [Subsection 400.3.06](#) to determine acceptance of subsurface mixes.

On Contracts involving 1,000 tons (1000 Mg) or less of asphaltic concrete, the mixture is accepted for 100 percent payment of the asphaltic concrete Unit Price provided it meets the following:

1. Minimum requirements for a 1.00 pay factor for asphalt cement content and a 0.90 pay factor for gradation in the applicable [Mixture Acceptance Schedule—Table 9 or 10](#) of [Subsection 400.3.06](#).
2. Minimum requirements for a 0.90 pay factor in [Table 12 of Subsection 402.5.01.C, “Calculate Pavement Mean Air Voids.”](#)

If the material placed on Contracts involving 1,000 tons (1000 Mg) or less of asphaltic concrete does not meet the above requirements, the material will be paid for using the applicable acceptance schedule.

C. Calculate Pavement Mean Air Voids

The Department will determine the percent of maximum air voids for each lot by dividing the pavement mean air voids by the maximum pavement mean air voids acceptable.

The Department will determine the payment for each lot by multiplying the Contract Unit Price by the adjusted pay factor shown in the following Air Voids Acceptance schedule:

Table 12 - Air Voids Acceptance Schedule

Pay Factor	Percent of Maximum Air Voids (Lot Average of Tests)	Percent of Maximum Air Voids (Lot Average all Tests) (for Reevaluations)
1.00	≤100	≤100
0.97	100.1 — 105	100.1 — 104
0.95	105.1 — 112	104.1— 109
0.90	112.1 — 124	109.1 — 118
0.80	124.1 — 149	118.1 — 136
0.70	149.1 —172	136.1 — 153
0.50	172.1 — 191	153.1 — 166

When the range tolerance is exceeded, the Department will apply a pay factor of 0.95 as described in [Subsection 400.3.06.B.2.](#)

D. Asphaltic Concrete for Temporary Detours

Hot mix asphaltic concrete placed on temporary detours that will not remain in place as part of the permanent pavement does not require hydrated lime. Hot mix used for this purpose is paid for at an adjusted Contract Price. The payment for this item shall cover all cost of construction, maintenance and removal of all temporary mix. Hot mix asphaltic concrete placed as temporary mix shall meet requirements established in Subsection 400.3.05.F.

Where the Contract Price of the asphaltic concrete for permanent pavement is let by the ton (megagram), the Contract Price for the asphaltic concrete placed on temporary detours is adjusted by subtracting \$0.75/ton (\$0.85/mg) of mix used.

Where the Contract price of the mix in the permanent pavement is based on the square yard (meter), obtain the adjusted price for the same mix used on the temporary detour by subtracting \$0.04/yd² (\$0.05/ m²) per 1-in (25-mm) plan depth.

Further price adjustments required in Subsection 400.3.06, "Quality Acceptance," which are based on the appropriate adjusted Contract Price for mix used in the temporary detour work shall apply should temporary mix be left in place. Hot mix asphalt produced as temporary mix containing no hydrated lime shall be removed and replaced with permanent mix containing hydrated lime.

E. Determine Lot Payment

Determine the lot payment as follows:

1. When one of the pay factors for a specific acceptance lot is less than 1.0, determine the payment for the lot by multiplying the Contract Unit Price by the adjusted pay factor.
2. When two or more pay factors for a specific acceptance lot are less than 1.0, determine the adjusted payment by multiplying the Contract Unit Price by the lowest pay factor.

If the mean of the deviations from the job mix formula of the tests for a sieve or asphalt cement content exceeds the tolerances established in the Mixture Acceptance Schedule—Table 9 or 10 and if the Engineer determines that the material need not be removed and replaced, the lot may be accepted at an adjusted unit price as determined by the Engineer. If the pavement mean air voids exceed the tolerances established in the Air Voids Acceptance Schedule – Table 12, remove and replace the materials at the Contractor's expense.

If the Engineer determines that the material is not acceptable to leave in place, remove and replace the materials at the Contractor's expense.

Section 403—Hot In-Place Recycled Asphaltic Concrete

403.1 Description

This Section covers the hot in-place recycling of the existing surface in a continuous multi-step process which includes:

- Softening the existing surface with heat
- Hot milling to obtain the depth shown in the plan typical section or stated in the contract general notes
- Applying a tack coat
- Applying a rejuvenating agent
- Adding plant produced asphaltic concrete and virgin aggregate, if needed, prior to remixing
- Thoroughly remixing, leveling, and relaying the recycled mixture

403.1.03 Submittals

Submit the proposed mix design for approval. As a minimum, the design shall include the following:

- The proportional blend of in-place materials and rejuvenating agent
- The proportional percentage of virgin aggregate and plant-produced hot mix asphalt, if required
- The sources of all materials to be used in the mixture
- The theoretical maximum specific gravity of the final mixture determined by AASHTO T-209
- The air void volume of the mixture after compacting for 50 gyrations with a gyratory compactor according to AASHTO TP 5

Use an approved, qualified laboratory to perform the mixture design analysis. Ensure the final design mixture has an air void volume within 3-5%.

Submit to the Office of Materials (OM) representative samples of each ingredient to be used in the final in-place mixture for design verification and additional testing as needed. The Department will perform testing for moisture and rutting susceptibility. Adjust mixture proportions as needed to ensure the final mixture meets the following requirements:

- Average rut depth not to exceed 0.3 in (7 mm) when tested using GDT 115.
- Minimum tensile splitting ratio of 80% and minimum individual stress results of 60 psi (415 kPa) when tested using GDT 66.

<p>EXCEPTION: A tensile splitting ratio of no less than 70% is acceptable so long as all individual test values exceed 100 psi (690 kPa).</p>
--

Allow the Department two weeks to verify the mix design after receiving the proposed mix design and material. Do not begin recycling operations until the Department has approved the design and accepted the mixture.

403.2 Materials

The materials to be used and their specifications are listed below:

A. Aggregate

Add virgin aggregate, if required, which is from an approved source and which meets requirements of Section 800. Use the stone size and spread rate specified in the plans. Additional virgin aggregate from approved sources may be added based on the mixture design analysis at no additional cost to the Department.

B. Plant-Produced Hot Mix Asphaltic Concrete

Add the type and amount of plant-produced asphaltic concrete, if required, as specified in the plans. Additional asphaltic concrete may be added based on the mixture design analysis at no additional cost to the Department. Ensure the hot mix asphaltic concrete is produced according to Section 400 and Section 402.

C. Asphalt Cement Rejuvenating Agent

Obtain approval by the Office of Materials for the source, amount, and type of rejuvenating agent to be used. The Department reserves the right to change, without a change in the contract unit price, the agent and amount being used in the mixture if it is determined by the Engineer that the rejuvenating agent is not performing satisfactorily.

D. Bituminous Tack Coat

Use a cationic asphalt emulsion CRS-2h, CSS-1h, or CQS-1h for the bituminous tack coat that meets Section 824. Apply the tack coat with a system equipped with positive stop/start capabilities that will prevent tack puddles and which will uniformly distribute the tack across the full width of the surface being recycled. Apply tack after the existing surface has been heated, milled, and removed from the roadway and prior to replacing the material onto the roadway.

E. Asphalt Modifier

Provide asphalt modifier as specified in the Plans. It shall be added at a dosage rate that will yield at least 3% solid polymer by weight of the asphalt cement of the in-place material. Asphalt modifiers shall be approved by the Office of Materials prior to use in the work. The Department reserves the right to change the type modifier and amount to be used, without a change in the contract unit price, if the Engineer determines that the asphalt modifier is not performing satisfactorily.

403.2.01 Delivery, Storage, and Handling

A. Aggregate Storage

Store or stockpile mineral aggregates in a manner that will prevent segregation, mixing of the various sizes, and contamination with foreign materials.

B. Storage of Bituminous Material

Always keep clean all equipment used to store and handle bituminous material and operate it in such a manner to prevent contamination with foreign matter.

403.3 Construction Requirements

403.3.01 Personnel

General Provisions 101 through 150.

403.3.02 Equipment

The Engineer shall approve all equipment, tools, and machines used to perform this work. Do not attempt work with malfunctioning equipment. The Engineer may stop the work if equipment and tools are not sufficient to place the materials satisfactorily.

A. Heating and Milling Units

Ensure the heating unit meets the following requirements:

- Capable of heating the asphaltic concrete pavement to a temperature high enough to remove excess moisture and allow hot milling of the material to the designated plan depth without breaking aggregate particles
- Controls the heating process to prevent charring the existing surface, avoid producing undesirable pollutants, and prevent differential softening of the pavement
- Confine the heat application under a shielded, or enclosed, hood

Make all efforts to protect adjacent landscape from heat damage. Rebuild, repair, restore, and make good all injuries or damages to adjacent landscape, at the Contractor's expense. Equip the unit which contains milling heads with longitudinal grade controls as described in Subsectin 403.3.02.C which will consistently control the depth of the milling operation. Milling heads shall remove the heated existing pavement to the depth specified in the Plans for the full transverse width even if additional virgin aggregate or asphaltic concrete mixture is added at no cost to the Department.

Use a portable milling unit to remove heated material from around utility structures to the full plan depth just prior to placement of the recycled material. Do not attempt to remove heated material from utility structures with hand tools only and do not damage the structures. Repair any damage to structures at no cost to the Department.

B. Blending Unit

Provide a blending unit which meets the following requirements:

- Capable of blending the removed material and rejuvenating agent (as well as virgin aggregate, asphalt modifier, and plant-produced hot mix asphaltic concrete, if required) into a homogeneous mixture
- Synchronizes application of all materials based on the volume of material being recycled to provide a proportional application at the predetermined application rate

Add the rejuvenator after milling has taken place and before or during the blending process with a positive start/stop mechanism that is automatically controlled by the volume of recycled material to be rejuvenated. Do not add rejuvenator based on linear distance travelled.

Add asphalt modifier, if required, at locations specified in the Plans or directed by the Engineer. Add modifiers during the blending process through a distribution system that will uniformly control the rate of application based on the volume of material being recycled and which contains a measuring system to verify the dosage rate.

C. Screed

Ensure the screed meets the following requirements:

- Capable of collecting and distributing the recycled mixture over variable widths for the entire width being processed
- Capable of controlling transverse cross-slope as directed by the Engineer
- Provides a uniform cross-section without streaks or blemishes
- Controls longitudinal grade electronically in conjunction with a mobile reference or by a non-contacting laser or sonar type ski with at least four referencing stations mounted at a minimum length of 24 feet (7.2 m)

D. Auxiliary Equipment

Provide suitable surface cleaning equipment, hand tools, rollers, and other support equipment necessary to perform the work. Ensure all other equipment meets requirements of Section 400.

403.3.03 Preparation

General Provisions 101 through 150.

403.3.04 Fabrication

General Provisions 101 through 150.

403.3.05 Construction**A. Surface Preparation**

Thoroughly clean the surface to be recycled of all dirt, vegetation, and other objectionable materials immediately prior to the affected area being recycled. Remove all metal raised pavement markers and thermoplastic paint markings prior to recycling.

B. Heat, Remove, and Blend Materials

Evenly heat the pavement at full lane width plus a minimum 3 in (75 mm) overlap onto adjacent pavement materials. Control the heating to ensure uniform penetration without differential softening of the surface, and so that the heated material has a temperature in the range of 240 ± 20 °F (115 ± 11 °C) measured immediately behind the heating unit. If virgin aggregate is added, distribute the aggregate across the entire width being recycled prior to the last heat application.

Hot mill and rework the pavement to the width and depth shown in the plan typical section. Control the width of each pass to provide proper placement of longitudinal joints. Control the depth of loosened pavement to within 1/4 in (6 mm) of the depth specified. Ensure the milled material is heated sufficiently so that it is free of lumps. Milled particles shall

not be greater than 1-1/2 in (40 mm) in size. Accomplish the recycling by using milling heads capable of gathering the loose material and conveying it to a mixing chamber. The mixing chamber should blend the material uniformly and create a windrow with the final mix. Do not use scrapers, scarifiers, or any mechanical means of removing the softened pavement other than milling heads.

Ensure the final blended mix in the windrow is uniform. All aggregate shall be consistently coated. There shall be no evidence of broken or fractured aggregate in the windrowed material. Inconsistency and or non-uniformity of the windrowed material prior to placement will result in the immediate cessation of recycling until a plan of corrective action is approved by the Engineer. After modifications to the equipment or adjustment to the additives proportions have been made and approved, the Contractor should be allowed to resume work in a 500 ft (152 m) test section to be evaluated by the Engineer prior to continuing recycling

Blend the removed material with a rejuvenating agent (and virgin aggregate, asphalt modifier, or plant-produced hot mix asphaltic concrete, if needed) to produce a homogeneous mixture. Control the rate of application of the rejuvenator to ensure compliance with the mix design and Dynamic Shear Rheometer (DSR) values specified in Subsection 403.3.06.A. Apply other materials as specified in the contract or as determined by the mix design analysis.

C. Tack Coat

Apply tack coat uniformly over the milled area prior to placement of the blended materials. Control the application rate within 0.04 – 0.06 gal/yd² (0.18 – 0.27 L/m²). At any time during the recycling process it is observed that an adequate bond is not being achieved, three six-inch (150mm) cores may be obtained for testing. These cores will be evaluated for adequate bond strength using NCAT's bond shear device inconjunction with the Marshall Apparatus. A minimum shear strength of 100 psi shall be required.

D. Application

Control placement of the mixture to produce a surface true to line, grade, and cross-slope with a uniform surface texture free of segregation, lumps, or other unacceptable streaks or blemishes as determined by the Engineer. Ensure the mixture meets the acceptance requirements for mixture quality, compaction, smoothness, and thickness as specified in Subsection 403.3.06.

E. Overlay

Overlay the recycled mixture, if required by the contract, by producing and placing a mixture that meets requirements of Section 400 and Section 402. Smoothness requirements for the hot in-place recycled mixture do not apply if the mixture is overlaid.

403.3.06 Quality Acceptance

A. Mixture

Base acceptance of the materials used in the work on Section 106 and Section 400 except that pay factors for gradation and asphalt content will not apply. Take a minimum of one sample of mixture for each day of operation to determine quality acceptance of the mixture.

Take samples directly behind the paver according to GSP 15 at the location determined by the Engineer. Perform extraction and gradation testing according to GDT 83 and GDT 38 or other suitable method approved by the Office of Materials. Determine the laboratory density, stability and flow of the mixture using the 50 blow Marshal procedure in AASHTO T-245.

Recover the extracted asphalt cement using GDT 119 and test for dynamic shear according to AASHTO TP 5, Method for Determining the Rheological Properties of Asphalt Binder Using Dynamic Shear Rheometer (DSR). Adjust the amount of rejuvenator as necessary to maintain DSR results within a range of 800-2000 poises (80-200 Pa-s) when tested at 140 °F (60 °C). Do not continue the work until corrective adjustments are made if two consecutive samples exceed the range for DSR values.

Submit test results electronically to the Engineer and Office of Materials within 24 hours after samples are taken.

B. Compaction

Compact the recycled mixture immediately after placement so that the maximum Pavement Mean Air Voids is 7.0 percent or less based on the theoretical specific gravity measured daily using the T-209 method performed on mixture sampled directly behind the paver. Determine the mixture compaction using either GDT 39 or GDT 59. The compaction is accepted in lots defined in Subsection 400.3.06.A “Acceptance Plans for Gradation and Asphalt Cement Content” and is within the same lot boundaries as the mixture acceptance. Meet the compaction requirements of Subsection 400.3.06.B₂ and Subsection 400.5.01.C₂. The Department will perform all compaction testing.

C. Smoothness

The Department will perform acceptance testing for surface course smoothness tolerance using the Laser Road Profiler according to GDT 126. Smoothness testing will be performed on the mainline traveled way and on ramps more than one-half mile (kilometer) in length.

Clean the roadway of any debris and obstructions and provide traffic control to conduct the testing when requested by the engineer.

Ensure the pavement does not exceed a target smoothness index of 900. Do not continue the work until corrective adjustments have been made if the target value is exceeded. Perform corrective work at no expense to the Department by repeating the hot in-place recycling process, according to this Section, if the smoothness index exceeds 1025.

Maintain a 10 ft. (3 m) straightedge in the vicinity of the paving operation at all times to use in measuring minor surface irregularities and provide the labor for its use. Correct all irregularities in excess of 1/8 in (3 mm) in 10 ft. (3 m). Stop the operation until corrective measures are taken when irregularities such as rippling, tearing, or pulling indicate a continuing problem in equipment, mixture, or operating techniques.

D. Mill Depth

Mill heated material to the thickness specified in the plan typical section or contract general notes. Take cores at locations determined by the Engineer at a minimum frequency of one core per 1000 ft (300 m) per two lanes of roadway or five cores per day, whichever is less, to verify mill depth.

The Department will determine the average mill depth based on roadway core measurements according to GDT 42. Mill depth will be determined based on total rejuvenated thickness less any thickness contributed by added virgin materials.

To receive full payment for mill depth, ensure the average milled depth is no less than 1/4 in (6 mm) of that specified in the plan typical section or contract general notes. Apply a pay reduction of 25% to the total square yards (meters) applied that day if the average depth is less than that specified, by more than 1/4 in (6 mm) but no more than 1/2 in (13 mm) of that specified.

Take additional cores to determine the area of deficient depth if the average depth is less than that specified, by more than 1/2 in (13 mm).

E. Corrections

Correct any areas deficient in depth by more than 1/2 in (13 mm) by repeating the hot in-place recycling process at no expense to the Department. Stop the work until corrective measures are made if the average mill depth for two consecutive days is less than 1/4 in (6 mm) of that specified. No individual location shall be recycled more than 2 times. If after the second recycling process, the deficiency is still apparent, mill and in-lay this location with plant produced asphaltic concrete. The plant produced asphaltic concrete shall be equivalent to the recycled design properties.

F. Test Section and Acceptance

The contractor shall be granted a 1 lane mile (1600 m) test section at the beginning of construction to be evaluated by the Office of Materials for acceptance prior to continuing recycling. If any specified requirement is not obtained, work shall be immediately stopped. If at any time during construction, it is determined that the Contractor’s equipment and recycling techniques can not consistently meet requirements, the recycling operation shall be stopped until the Office of Materials

Section 403-Hot In-Place Recycled Asphaltic Concrete

reviews and approves all modifications in equipment and recycling techniques. The Contractor shall place a 500 ft (152 m) test section to be evaluated and accepted by the Office of Materials prior to resuming recycling.

G. Rutting susceptibility test.

Cores taken each day for depth verification shall be tested according to GDT 115. Maximum deformation shall be 5.0 mm (0.2 in).

403.4 Measurement

Hot in-place recycled asphaltic concrete mixture is measured by the square yard (meter) of the surface area completed and to the depth specified. In computing square yards (meters), the lengths and widths used shall be as specified in Section 109, Measurement and Payment.

Rejuvenating agent, virgin aggregate, and plant-produced asphaltic concrete shall be added as individual components of the recycled mixture as required in the mix design analysis. Include this cost in the unit bid price per square yard (meter). Bituminous materials for tack coat applied and accepted will be measured as outlined in Section 109.

403.4.01 Limits

General Provisions 101 through 150.

403.5 Payment

Hot in-place recycled asphaltic concrete is paid for at the contract unit price per square yard (meter). Payment is full compensation for furnishing all materials, all equipment, Work, and labor. Payment also includes removal of raised pavement markers and thermoplastic striping, if applicable, heating and hot-milling, adding rejuvenator, performing the mix design, performing project sampling and testing, and other incidentals necessary to complete the work. Aggregate and hot mix asphaltic concrete which may be added to meet requirements of the mix design analysis shall be included in the contract unit price.

Bituminous tack coat is paid for per gallon (liter) under separate payment. Hot mix asphaltic concrete specified for overlaying, if any, will be paid for under separate payment. Aggregate specified in the contract, if any, (excluding that required based on the mix design analysis) will be paid for under separate payment.

Payment will be made under:

Item No. 403	Hot in-place recycled asphaltic concrete	Per square yard (meter)
Item No. 403	Hot in-place recycled asphaltic concrete including polymer-modifier	Per square yard (meter)

403.5.01 Adjustments

General Provisions 101 through 150.

Section 404—Paver-Laid Surface Treatment

404.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 405—Hot Asphalt-Vulcanized Rubber Seal Treatment

405.1 General Description

This work includes placing a hot asphalt–vulcanized rubber seal treatment on an existing pavement surface according to the Specifications.

405.1.01 Definitions

General Provisions 101 through 150.

405.1.02 Related References

A. Standard Specifications

B. Referenced Documents

General Provisions 101 through 150.

405.1.03 Submittals

General Provisions 101 through 150.

405.2 Materials

A. Asphalt Cement

Before adding rubber and diluent, ensure that the asphalt cement conforms to Section 820.2.01, PG 58-22.

B. Ground Vulcanized Tire Rubber

Ensure that the ground vulcanized tire rubber meets the following requirements:

Sieve Size	Maximum Percent Passing by Weight
No. 8 (2.36 mm)	100
No. 10 (2.0 mm)	98
No. 40 (425 µm)	10

Ensure that the granulated rubber has the following characteristics:

- A specific gravity of 1.17 ± 0.03
- No more than a trace of fabric
- Free of wire or other contaminating materials

An exception is that up to four percent of calcium carbonate may be included to prevent the particles from sticking together.

- Fully vulcanized

C. Diluent

For diluent, use kerosene with a boiling point above 350 °F (175 °C).

D. Cover Aggregate

Ensure that cover aggregate conforms to Section 800, Class "A," Group II.

Ensure that gradation of the cover aggregate meets Section 800 for No. 7 stone.

Preheat the cover aggregate to 290 °F to 350 °F (140 °C to 175 °C) and precoat with a maximum of 0.75 percent of performance grade PG 58-22 described in Section 820. See Subsection 405.3.05.A, "Mixing."

405.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

405.3 Construction Requirements

405.3.01 Personnel

General Provisions 101 through 150.

405.3.02 Equipment

Ensure that equipment conforms to Section 424 and the following:

A. Canvas Cover

If directed by the Engineer, cover exposed material with canvas to help prevent the temperature of exposed material from dropping. See Subsection 405.3.05.A, "Mixing."

B. Aggregate Spreader

Use an adjustable, self-propelled aggregate spreader to accurately spread the amounts given in the Plans per square yard (meter).

C. Rubber Tire Rollers

Use at least three rubber tire rollers loaded to 5,000 lbs (2275 kg) per tire. Inflate tires to 100 psi (700 kPa).

405.3.03 Preparation

A. Spread the Asphalt-Rubber Composition

Before applying the hot asphalt-rubber composition, clean and patch the existing pavement surface and treat with a bituminous tack coat as specified in Section 413.

B. Test the Distributor Trucks

Before spreading the asphalt-rubber composition, test distributor trucks for transverse spread within the previous 6 months. Prove to the Engineer that each transverse spread was as uniform as possible and variance was never greater than 15 percent.

<p>NOTE: A transverse spread for other asphalt products will not be accepted. The rate of transverse spread will be determined according to the requirements of the Georgia tentative test method.</p>

405.3.04 Fabrication

General Provisions 101 through 150.

405.3.05 Construction

A. Mixing

Mix asphalt and rubber as follows:

Section 405-Hot Asphalt-Vulcanized Rubber Seal Treatment

1. Before adding the rubber, ensure that the temperature of the asphalt is no higher than 325 °F (160 °C) for PG 58-22.
2. Rapidly combine the rubber with the asphalt. Mix the rubber until the material approaches a semi-fluid consistency. Ensure that the weight proportions of the two materials are as follows:

Asphalt	75 ± 2%
Rubber	25 ± 2%

3. Mix the hot asphalt and rubber for at least 5 minutes.

NOTE 1: Design the rubber and asphalt combination method to ensure that the Engineer can determine the percentages by weight of each component to be mixed.

Ensure that the mixing equipment can produce a homogenous mixture of rubber and asphalt to prevent separation.

NOTE 2: Preheating, precoating, and covering aggregate with canvas may be waived if proper facilities are not available and if application conditions are favorable. Precoating is often used for dust control.

4. After the asphalt and rubber have reacted fully, add a diluent to:
 - Temporarily reduce the viscosity of the mixture
 - Improve the spraying action from the distributor
 - Provide a better coating of cover aggregateThe diluent amount is 5.5 percent to 7.5 percent, by volume, of the hot asphalt-rubber composition. When adding the diluent, ensure that the temperature of the hot asphalt-rubber composition does not exceed 350 °F (175 °C).

B. Spreading

Spread the asphalt-rubber mixture as follows:

1. When the proper consistency is reached, immediately begin application. Never hold the mixture at temperatures over 325 °F (160 °C) for more than 1.5 hours after reaching application consistency.
2. Use the following application rates:
 - a. In areas where temperatures remain above 20 °F (-7 °C) during the winter season, apply the hot asphalt-rubber mixture at 0.55 gallons/yd², ± 0.03 gallons/yd² (2.5 liters/m², ± 0.15 liters/m²).
 - b. In areas where temperatures drop below 20 °F (-7 °C); apply the mixture at 0.60 gal/yd², ± 0.03 gal/yd² (2.7 liters/m², ± 0.15 liters/m²) unless otherwise specified by the Engineer.

Application rates are based on 7.5 lbs/gal (0.90 kg/L), hot, and conversions to the standard 60 °F (15 °C) are not necessary.

NOTE: Place the hot asphalt-rubber mixture only when the ambient temperature is 60 °F (15 °C) or above and rising.

3. Apply the cover aggregate at 25 to 40 lbs/yd² (14 to 22 kg/m²), which is 25 to 27 lbs (14 to 15 kg) for No. 7 stone and 35 to 39 lbs (19 to 21 kg) for No. 8 stone, or as directed by the Engineer.
4. Perform at least four complete coverages with the pneumatic rollers. Roll the cover aggregate immediately after application to ensure maximum aggregate embedment.

Do not permit traffic on the completed surface until approved by the Engineer.
5. If heavy or high-speed traffic may displace the cover aggregate, apply 5 to 10 lbs/yd² (2.5 to 5.0 kg/m²) of sand after rolling and before opening the lane to traffic as directed.
6. Sweep the joint edges clean of overlapping cover aggregate before applying the adjacent asphalt-rubber material.

Section 405-Hot Asphalt-Vulcanized Rubber Seal Treatment

7. Avoid skips and overlaps at joints and protect the surfaces of adjacent structures from being spattered or marred. These defects will be corrected at the Contractor's expense.
8. Make transverse joints as follows:
 - a. Place building paper over the ends of the previous applications.
 - b. Start the adjoining application on the building paper.
 - c. Remove and dispose of the paper to the Engineer's satisfaction.
9. In urban areas, remove excess chips within 24 hours after placing. Do not use gutter brooms or steel-tined brooms, and do not disturb the loose chips from parkways, sidewalks, and intersecting streets.
Continue this operation until excess or loose rock is removed from the roadway surface and abutting Rights-of-Way.
10. If needed, apply a flush coat to areas without substantial traffic at the Engineer's direction. Apply light sanding after flushing to prevent pickup, if required.

405.3.06 Quality Acceptance

General Provisions 101 through 150.

405.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

405.4 Measurement

The quantity to be measured is the number of square yards (meters) of seal treatment completed and accepted. The length is measured along the surface. The width is specified on the Plans, plus or minus any authorized changes. Irregular areas are measured by the surface square yards (meters) within the lines shown on the Plans or authorized changes.

405.4.01 Limits

General Provisions 101 through 150.

405.5 Payment

The accepted quantity of seal treatment is paid for at the Contract Unit Price per square yard (meter). Payment is full compensation for providing materials, hauling, mixing, spreading, rolling, and performing any other work to complete the Item.

Payment will be made under:

Item No. 405	Hot asphalt vulcanized rubber seal treatment	Per square yard (meter)
--------------	--	-------------------------

405.5.01 Adjustments

General Provisions 101 through 150.

Section 406—Coal Tar Emulsion Seal Coat

406.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 407—Asphalt-Rubber Joint and Crack Seal

407.1 General Description

This work includes filling (Type M) or sealing (Type S) joints and cracks in existing pavements with rubber asphalt mixtures. A polymer-modified asphalt rubber (PMAR) blend may be used in lieu of both Type M and Type S.

407.1.01 Definitions

Type M: Used to fill joints and cracks in Portland cement concrete or asphaltic concrete pavements when required by the Plans before placing an overlay.

Type S: Used to seal joints and cracks in Portland cement concrete and asphaltic concrete pavements and shoulders when not placing an overlay.

407.1.03 Submittals

Certify that each lot of premixed material meets the requirements of this Specification and shall submit the test results of each lot for each Project. Ensure that each sealant lot is delivered in containers with the manufacturer's name or trademark and lot number plainly marked.

Furnish samples of the individual components of premixed material as follows:

- At least 20 lbs (10 kg) of rubber representative of each lot
- At least 5 gal (15 L) of asphalt containing additives as proportioned
- Proportional quantities of mixing aids or additives not included above

407.2 Materials

Ensure that the sealant material is a premixed, asphalt-rubber sealant mixture. Ensure that the mixture is a blend of asphalt cement, aromatic extender oil(s), and recycled or reclaimed tire crumb rubber (18 ± 1 percent and 22 ± 1 percent by weight for Type S and Type M, respectively based on weight) in a closely controlled manufacturing process. The dosage rates of tire crumb rubber may be reduced if a polymer modifier is added to the mixture. Produce a mixture with the following properties:

A. Workability

The mixture pours readily and penetrates a 1/4 in (6 mm) pavement joint or crack to a depth of at least 1 in (25 mm) when the application temperature of the fully reacted mixture is 350 °F (204 °C) and the air temperature is 35 °F (2 °C) or higher.

The mixture, when placed in conventional field installation equipment, readily melts to a pumping consistency after being heated to 400 °F (204 °C) for 2 hours maximum. The mixture remains in a pumping consistency when the temperature of

the field installation equipment is reduced to the normal operating temperature range of 300 °F to 350 °F (150 °C to 175 °C).

B. Curing

The mixture contains no water or volatile solvents and cures immediately when cooled to a sufficient viscosity to prevent tracking caused by traffic.

C. Softening Point and Flexibility

When a fully reacted mixture sample of asphalt-rubber has been heated at 350 °F (175 °C) for one hour, or when a PMAR blend has been heated at 380 °F (195 °C) for one hour, it shall pass the following laboratory tests:

1. Softening Point

The minimum softening point by ring and ball described in ASTM D 36 is as follows:

PMAR	185 °F (85 °C)
Type S	135 °F (60 °C)
Type M	150 °F (65 °C)

2. Flexibility

Bend a 1/8 in (3 mm) thick x 1 in (25 mm) wide x 6 in (150 mm) long mixture specimen after conditioning to 10 °F (-12 °C) at a minimum bending rate of 9 degrees per second (10 seconds maximum for a 90° bend) over a 1 in (25 mm) diameter mandrel without cracking.

D. Separation

Test the PMAR blend for phase separation by pouring a representative sample of the mixture into aluminum tubes 1 in (25 mm) in diameter and 5-1/2 in (137 mm) long as described in AASHTO PP5. Cure the samples at 325 °F (165 °C) for 48 hours. Take samples from the top and bottom of the tube and determine softening point as described in ASTM D 36. Average the test results from the top and bottom samples. If there is 4% or more difference between the average test result and either of the top or bottom test results, reject the mixture due to separation.

E. Adhesion

When cooled, the mixture bonds strongly to both asphalt and concrete pavement surfaces. The mixture contains no materials that chemically react with these surfaces to reduce the short-term and long-term adhesion bonds.

F. Acceptable Recycled or Reclaimed Tire Crumb Rubber

Before the rubber is added, ensure the asphalt cement used in the mixture conforms to the requirements of Section 820.2.01, PG 58-22 or PG 64-22.

Ensure that the recycled, reclaimed tire crumb rubber used in the mixture meets the following requirements:

- Was obtained from used pneumatic tires (such as automobile, truck, bus, etc.)—not solid tires and non-tire rubber sources
- Was produced from an ambient grinding process (crushes, tears, grinds, or wears the used rubber tires at or above ordinary room temperature that produces rubber particles with a ragged, sponge-like surface). Cryogenically ground rubber or tire buffings are prohibited.
- Contains recycled, vulcanized crumb rubber and/or reclaimed (devulcanized) rubber
- Contains at least 25 percent natural rubber by weight of the total rubber portion of the mixture
- Contains no more than a trace of fabric
- Is free of wire and other contaminating materials, except up to four percent calcium carbonate or talc to prevent rubber particles from sticking
- Contains no rubber particles greater than 1/4 in (6 mm) long

- Meets the following gradation requirements:

Sieve Size	Percent Passing
No. 10 (2.0 mm)	100%
No. 16 (1.18 mm)	95 to 100%
No. 30 (600 μm)	40 to 80%
No. 80 (180 μm)	0 to 5%

G. Poly-modified Asphalt Rubber

If a PMAR blend is used, ensure it meets the following additional requirements:

PROPERTY	SPECIFICATION LIMITS
Cone Penetration, 77 °F (25 °C)	30 - 60 dmm
Resilience, 77 °F (25 °C), % Recovery	30% minimum
Ductility, 77 °F (25 °C), 50 mm/minute	300 mm minimum
Asphalt Compatibility (ASTM D 3407)	Pass
Bitumen Content (ASTM D 4)	60% minimum
Tensile Adhesion (ASTM D 3583)	500% minimum
Rotational Viscosity (Brookfield), No. 5 spindle, 20 RPM, 400 °F (205 °C)	3,000 – 15,000 cp

407.2.01 Delivery, Storage, and Handling

Package the premixed sealant material in units weighing no more than 30 lbs (15 kg) with a maximum of two 30 lbs (15 kg) units per shipping container. Ensure that the plastic film used to package the units melts at normal application temperatures when placed in the installation equipment.

407.3 Construction Requirements

407.3.01 Personnel

General Provisions 101 through 150.

407.3.02 Equipment

A. Field Installation Equipment

Use field installation equipment that produces or maintains specified temperatures, even if filled to capacity.

Ensure that the equipment produces or maintains a homogenous mixture of asphalt and rubber at a uniform temperature without hot or cool spots or rubber and asphalt segregation in the mixture.

B. Crack Filling Equipment

Ensure that the equipment for filling the joints and cracks directs the sealant into the crack. Seal large cracks from the bottom up. Provide squeegees as necessary.

C. Air Compressor(s)

Ensure that the air compressors are satisfactory to the Engineer.

407.3.03 Preparation

A. Joint and Crack Preparation

Use compressed air to thoroughly clean the joints and cracks to be sealed.

Clean the pavement surface and check the joints and cracks to ensure that they are free of vegetation, dirt, dust, moisture, and other foreign material.

407.3.04 Fabrication

General Provisions 101 through 150.

407.3.05 Construction

A. Restrictions

Do not seal joints and cracks if:

- The joint or crack surface to be treated is not thoroughly dry.
- Rain is imminent.
- The air temperature is below 35 °F (2 °C).

B. Procedure

Follow this procedure to seal joints and cracks:

1. Place the prepackaged sealant mixture in the field installation equipment.
2. Heat the sealant mixture for the proper time and temperature to provide a full reaction between the asphalt and rubber.
3. Apply the mixture at the specified application temperature according to the manufacturer's recommendations or the laboratory's approval.
4. Carefully fill the joint or cracks, slightly overfull. Strike off the excess with a V-shaped squeegee to feather the sealant out to a width of approximately 2 in (50 mm).

407.3.06 Quality Acceptance

If the packaged units are bonded or stuck together or to the shipping container, or if packaging staples or fasteners cause sealant contamination, the material may be rejected as determined by the Engineer.

The manufacturer must meet the requirements of this Specification and furnish evidence of successful field installation and performance under similar environmental and project conditions.

407.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

407.4 Measurement

Joints and cracks will be measured by the linear foot (meter) by surface measure.

407.4.01 Limits

General Provisions 101 through 150.

407.5 Payment

Joints and cracks sealed according to the Plans and this Specification will be paid for at the Contract Unit Price bid.

Payment is full compensation for furnishing all materials and performing the work.

Payment will be made under:

Section 407-Asphalt-Rubber Joint and Crack Seal

Item No. 407	Polymer-modified asphalt –rubber joint and crack seal	Per linear foot (meter)
Item No. 407	Asphalt-rubber joint and crack seal, type “S”	Per linear foot (meter)
Item No. 407	Asphalt-rubber joint and crack seal, type “M”	Per linear foot (meter)

407.5.01 Adjustments

General Provisions 101 through 150.

Section 408—Joint and Crack Cleaning and Seal

408.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 409—Latex Modified Asphalt Concrete

409.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 410—Warm Mix Recycled Asphaltic Concrete

410.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 411—Asphaltic Concrete Pavement, Partial Removal

411.1 General Description

This work includes removing portions of existing asphaltic concrete pavement, removing base and subgrade as shown on the Plans or as directed by the Engineer, and sawing joints in the existing asphaltic concrete pavement.

411.1.01 Definitions

General Provisions 101 through 150.

411.1.02 Related References

A. Standard Specifications

General Provisions 101 through 150.

411.2 Materials

General Provisions 101 through 150.

411.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

411.3 Construction Requirements

411.3.01 Personnel

General Provisions 101 through 150.

411.3.02 Equipment

General Provisions 101 through 150.

411.3.03 Preparation

General Provisions 101 through 150.

411.3.04 Fabrication

General Provisions 101 through 150.

411.3.05 Construction

A. Saw Joints

Saw joints as follows:

1. Saw joints true to the lines shown on the Plans or as directed by the Engineer.
2. Saw joints the full depth of the existing asphaltic concrete unless otherwise shown on the Plans or directed by the Engineer.
3. Leave a neat, vertical face for the full depth of the retained portion.

The Engineer may approve sawing less than full depth if the Contractor demonstrates that the requirements can be met.

B. Remove Pavement

After sawing the joints, begin removing the isolated pavement.

Use removal methods that will not damage the pavement edges that will remain in place or impede the proposed construction.

Pavement, base, or subgrade removed becomes the Contractor's property unless otherwise specified in the Contract.

C. Protect Remaining Edges

After removing the pavement, protect the pavement edges that will remain in place.

1. Do not allow traffic or equipment to cross the remaining edges.
2. Repair or restore the damaged edges to the Engineer's satisfaction at no additional cost to the Department.

411.3.06 Quality Acceptance

General Provisions 101 through 150.

411.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

411.4 Measurement

This work will not be measured separately for payment.

411.4.01 Limits

General Provisions 101 through 150.

411.5 Payment

No separate payment will be made for the work described in this section.

When Item 205 is included in the Proposal as a Pay Item, payment for this work is included in payment for unclassified excavation by the cubic yard (meter) as described in Subsection 205.4, “Measurement.” Otherwise, payment is included in the overall price bid for other Contract Items.

Payment is full compensation for providing labor and equipment, sawing, removing and disposing, and providing other incidentals to accomplish the work described in this Specification.

Sawing Portland cement concrete overlaid with asphaltic concrete will be measured and paid for according to Section 444.

411.5.01 Adjustments

General Provisions 101 through 150.

Section 412—Bituminous Prime

412.1 General Description

This work includes preparing and treating an existing surface with bituminous material and blotter material, if required. Treat the surface according to these Specifications and conform to the lines shown on the Plans or established by the Engineer.

412.1.01 Definitions

General Provisions 101 through 150.

B. Referenced Documents

General Provisions 101 through 150.

412.1.03 Submittals

General Provisions 101 through 150.

412.2 Materials

Unless otherwise specified, select the types of bituminous materials. The Engineer will determine the grade of materials to be used. The Specifications for the bituminous materials include:

Material	Section
Cutback Asphalt, RC-30, RC-70, RC-250 or MC-250, MC-30, or MC-70	821.2.01
Blotter Material (Sand)	412.3.05.G.3

412.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

412.3 Construction Requirements

412.3.01 Personnel

General Provisions 101 through 150.

412.3.02 Equipment

Provide equipment that is in good repair, including at least the following units that meet the requirements of Subsection 424.3.02, "Equipment."

- Pressure distributor
- Power broom and blower
- Aggregate spreader (if required)
- Pneumatic-tired roller

412.3.03 Preparation

See Subsection 412.3.05.B, "Condition of Surface."

412.3.04 Fabrication

General Provisions 101 through 150.

412.3.05 Construction

Prime the following bases and other areas:

- Cement or lime stabilized bases or sub-bases, regardless of pavement thickness
- Soil or aggregate bases or sub-bases on which bituminous surface treatment will be placed
- Soil or aggregate bases or sub-bases on which less than 5 in (125 mm) total thickness of hot mix asphaltic concrete will be placed

Prime is not required on driveway construction and paved shoulders.

A. Weather Limitations

Do not apply bituminous prime under any of these conditions:

- Surface is wet.
- Air temperature is below 40 °F (4 °C) in the shade.
- Rain is imminent.
- Weather conditions may prevent proper prime coat construction.

B. Condition of Surface

Ensure that the surface to which the prime is to be applied has been finished to the line, grade, and cross section specified.

Ensure that the surface is uniformly compacted and bonded. Correct surface irregularities according to the Specifications for the construction being primed.

C. Cleaning

Remove from the road loose material, dust, caked clay, and other material that may prevent bonding of the prime with the surface. Use power sweepers or blowers the full width of the prime and 2 ft (600 mm) more on each side. Where necessary, sweep by hand.

D. Moisture

Ensure that the surface is only slightly damp. If the surface is too wet, allow it to dry. If it is too dry, the Engineer may require that it be sprinkled lightly just before priming.

E. Temperature and Surface Texture

The surface texture and condition of the surface determine the bituminous material grades to be used.

The following table shows the bituminous material grades and application temperatures as they are applied to various surface textures.

Base Texture	Tight	Average	Open
Materials and grade	MC-30 RC-30	RC-70 or MC-70	RC-250 or MC-250
Application temperature °F (°C)	80–120 (27–49)	105-180 (41–82)	145–220 (63–104)

The Engineer will determine the temperature for applying bituminous prime within the limits shown above.

Heat and apply bituminous materials as specified in Subsection 424.3.05.D, “Heating Bituminous Material” and Subsection 424.3.05.E, “Applying Bituminous Material.”

F. Amount and Extent of Prime

The Engineer will determine the exact amount of bituminous material to be used within minimum and maximum rates of 0.15 to 0.30 gal/yd² (0.7 to 1.4 liters/m²). Apply the specified amount as follows:

1. Apply the determined amount uniformly and accurately. Ensure that the amount applied to any 0.5-mile (800 m) section is within 5 percent of the amount specified.
2. Apply the prime the full width of the proposed wearing surface that will be superimposed plus 6 in (150 mm) more on each side.

G. Protection, Curing, and Maintenance

Do the following after priming the surface:

1. Close to Traffic
Do not allow traffic on the primed surface. Leave the surface undisturbed until the prime thoroughly cures and does not pick up under traffic.
2. Roll
If the surface becomes soft after it is primed, roll the surface longitudinally with a pneumatic-tired roller at no more than 6 mph (10 kph) until the surface is firmly set.
3. Blot
If necessary to prevent the prime from being picked up, spread clean, dry, sharp sand over the surface by hand or mechanically. Apply sand only to places that are tacky and use the least amount needed to prevent pick up. No extra payment for this work or material will be made.
4. Open to Traffic

After rolling and sanding (if required), open the primed surface to ordinary traffic subject to the conditions in Subsection 412.3.05.G.1, "Close to Traffic."

5. **Curing and Maintenance**

The primed surface is properly cured when it has penetrated the base sufficiently to not be picked up or displaced by traffic. Temperature and weather conditions may increase curing time. Insure the primed surface has cured to the satisfaction of the Engineer prior to its being covered by other construction.

Maintain the prime coat and the primed surface course until it is covered by other construction. Repair potholes, scabs, and soft spots prior to covering with other construction. Remove excess bituminous material.

412.3.06 Quality Acceptance

General Provisions 101 through 150.

412.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

412.4 Measurement

Bituminous material for prime is not measured for separate payment.

412.4.01 Limits

General Provisions 101 through 150.

412.5 Payment

Bituminous material for prime is not paid for separately. The cost to clean the surface, furnish, haul and apply materials including water and sand, roll, and perform repairs and maintenance is included in the Unit Price bid for each individual Base Item.

412.5.01 Adjustments

General Provisions 101 through 150.

Section 413—Bituminous Tack Coat

413.1 General Description

This work includes furnishing and applying a bituminous tack coat on a prepared road surface including cleaning the road surface.

413.1.01 Definitions

General Provisions 101 through 150.

413.1.02 Related References

A. Standard Specifications

Section 822 – Emulsified Asphalt

Section 824—Cationic Asphalt Emulsion

B. Referenced Documents

General Provisions 101 through 150.

413.1.03 Submittals

General Provisions 101 through 150.

413.2 Materials

Ensure materials meet the following Specifications:

Material	Section
Asphalt cement, performance grade PG 58-22, PG 64-22, or PG 67-22	820.2.01
Anionic emulsion asphalt NTSS-1HM	822.2.01
Cationic emulsified asphalt CRS-2h or CRS-3	824.2.01

Asphalt cement of performance grade PG 58-22, PG 64-22 or PG 67-22 is used for bituminous tack coat in work performed in Section 400. Use anionic emulsified asphalt as an option with the approval of the Engineer. Use cationic emulsified asphalt as a special application material only if directed by the Engineer.

The Department may change the grade or type of bituminous materials without a change in the Contract Unit Price if the Engineer determines the grade or type selected is not performing satisfactorily.

413.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

Emulsified Asphalt

Maintain all equipment used for the delivery, storage, and handling of anionic emulsified asphalt or cationic emulsified asphalt to prevent contamination of the emulsion. Transfer anionic emulsified asphalt or cationic emulsified asphalt directly to the pressure distributor from the transport tanker.

Provide and maintain temperature measuring devices to continuously monitor the temperature of anionic emulsified asphalt or cationic emulsified asphalt in storage and in the pressure distributor. Do not allow anionic emulsified asphalt or cationic emulsified asphalt to freeze.

Note 1: Do not store anionic emulsified asphalt or cationic emulsified asphalt for a period longer than 30 days from the time of initial loading.

Note 2: Do not use anionic emulsified asphalt or cationic emulsified asphalt on GDOT funded Off System Projects after 30 days of initial loading.

413.3 Construction Requirements

413.3.01 Personnel

General Provisions 101 through 150.

413.3.02 Equipment

Provide equipment in good repair, including the following units that meet the requirements of [Subsection 424.3.02](#), “Equipment”.

- Power broom and blower
- Pressure distributor

Provide a dedicated pressure distributor for anionic emulsified asphalt NTSS-1HM to avoid contamination with incompatible materials.

413.3.03 Preparation

General Provisions 101 through 150.

413.3.04 Fabrication

General Provisions 101 through 150.

413.3.05 Construction

A. Seasonal and Weather Limitation

Do not apply tack coat if the existing surface is wet or frozen. Do not place emulsified asphalt if the air temperature in the shade is less than 40 °F (4 °C).

B. Application

Coat the entire areas to be paved with the tack coat unless directed otherwise by the Engineer. Apply tack coat with distributor spray bars instead of hand hoses, except in small areas inaccessible to spray bars.

Application Rates for Anionic Emulsified Asphalt or Cationic Emulsified Asphalt, gal/yd² (L/m²)

Type Mix	Minimum	Maximum
All Mixes except OGFC and PEM	0.06 (0.270)	0.10 (0.450)
<ul style="list-style-type: none"> • On thin leveling courses and freshly placed asphaltic concrete mixes, reduce the application rate to 0.04 to 0.06 gal/yd² (0.180 to 0.270 L/m²). • Allow anionic emulsified asphalt or cationic emulsified asphalt to break for a minimum of 30 minutes after initial application. Proceed with paving only after the anionic emulsified asphalt NTSS-1HM has cured to the satisfaction of the Engineer. • Do not use anionic emulsified asphalt or cationic emulsified asphalt under OGFC or PEM. 		

C. Temperature of Material

Apply bituminous materials within the temperature ranges specified below.

Bituminous Materials	Temperature of Application °F (°C)
Asphalt cement	350 - 400 (175 - 205)
Anionic Emulsified Asphalt NTSS-1HM	140 - 180 (60 - 80)
Cationic Emulsified Asphalt CRS-2h, CRS-3	140 - 180 (60 - 80)

D. Cleaning

Immediately before applying the tack coat, clean the entire area free of loose dirt, clay, and other foreign materials.

E. Application Rate

The Engineer will determine the application rate of the bituminous tack coat.

F. Limitations and Areas Coated

Apply only enough tack coat to the prepared road surface that can be covered with the new pavement course the same working day the tack coat is applied.

G. Maintenance and Protection

After applying the tack coat material, allow it to break until it is tacky enough to receive the surface course. Do not allow traffic on the tack.

413.3.06 Quality Acceptance

General Provisions 101 through 150.

413.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

413.4 Measurement

Bituminous materials for tack coat applied and accepted are measured as outlined in [Subsection 109.02, "Measurement of Bituminous Materials."](#)

Diluting emulsified tack coat is not ordinarily allowed except when used underneath slurry seal and approved by the Engineer. The composition of diluted emulsified tack coat defined in [Subsection 427.3.05, "Construction"](#) is measured by the gallon (liter) of diluted mix.

413.4.01 Limits

General Provisions 101 through 150.

413.5 Payment

The accepted volume of bituminous material will be paid for at the Contract Unit Price per gallon (liter) for bituminous tack coat of the type and grade approved by the Engineer, complete in place. Payment is full compensation for preparing, cleaning, furnishing, hauling, applying material, and providing incidentals to complete the work.

Payment will be made under:

Item No. 413	Bituminous tack coat	Per gallon (liter)
Item No. 413	Diluted emulsified asphalt tack coat	Per gallon (liter)

413.5.01 Adjustments

General Provisions 101 through 150.

Section 414—Hot Asphalt—Rubber Seal Treatment for Stress Relieving Interlayer

414.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 415—Asphalt Concrete Open Graded Interlayer

415.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 416—Intelligent Compaction for Asphalt Concrete

416.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 417—Paver Mounted Temperature Equipment

417.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 424—Bituminous Surface Treatment

424.1 General Description

This work includes placing one or more applications of bituminous material and aggregate on a previously prepared base or pavement.

424.1.01 Definitions

- **Single Surface Treatment:** One application of bituminous material that is covered with aggregate.
- **Double Surface Treatment:** A bituminous material application that is covered with aggregate of the size specified in the proposal followed by a second bituminous material application that is covered with a second specified size aggregate.
- **Triple Surface Treatment:** A bituminous material application that is covered with a specified size aggregate followed by subsequent applications of bituminous material that are covered with successively smaller size nominal aggregates.

Section 802—Aggregates for Asphaltic Concrete

Section 820—Asphalt Cement

Section 824—Cationic Asphalt Emulsion

B. Referenced Documents

QPL 65

424.1.03 Submittals

General Provisions 101 through 150.

424.2 Materials

A. Bituminous Material

Select the bituminous material from any type and grade listed in the materials table below. Notify the Engineer at least 10 days before ordering the bituminous material. The Engineer must approve the bituminous material choice.

For a list of latex sources, see [QPL 65](#).

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Asphalt Cement, Performance Grade PG 58-22 or PG 64-22*	820.2.01
Cationic Asphalt Emulsion, Grade CRS-2h or CRS-3*	824.2.01
Latex-Modified Cationic Asphalt Emulsion, Grade CRS-2L	824.2.02
* Use PG 64-22 or CRS-3 only at the Engineer's direction. (See Subsection 424.3.05.B.)	

B. Aggregates

The size and group of aggregates used in the surface treatment are specified in the Proposal under the appropriate Line Item.

Do not use unconsolidated limerock unless provided for in the Plans or Proposal.

Use Class B aggregates only where the surface treatment is used for shoulder construction or where it is to be overlaid with asphaltic concrete.

Material	Section
Coarse Aggregate, Class A Crushed Stone or Crushed Slag, Group I or II	800.2.01
Fine Aggregate for Asphaltic Concrete*	802.2.01
*For sand seal application, use WA 10 washed screenings made from Group II aggregates.	

424.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

424.3 Construction Requirements

424.3.01 Personnel

General Provisions 101 through 150.

424.3.02 Equipment

Have the Engineer approve equipment types and quantities before using equipment on the Project.

Ensure that the equipment used to construct the surface treatment:

- Produces work that complies with the standards in this section
- Is on the Project and in proper working order before construction begins and during construction.

A. Aggregate Spreader

The Department will inspect annually the aggregate spreader before it is used in the work. If the spreader is approved, the Department will attach an equipment certification sticker to the spreader.

Use a self-propelled aggregate spreader that can apply aggregate at the desired rate uniformly and accurately without corrugation, overlaps, or excess deficient areas.

Ensure that the spreader can spread courses to the required widths. Provide spreaders to promptly cover the full width of the asphalt application.

B. Pressure Distributor

The Department will inspect annually the pressure distributor before it is used in the work. If the distributor is approved, the Department will attach an equipment certification sticker to the distributor. The pressure distributor should be equipped as follows:

1. Mount the pressure distributor on pneumatic tires wide enough to prevent damage to the road surface.
2. Design, equip, maintain, and operate the distributor so that the bituminous material will be heated and applied evenly throughout the length of the spray bars. Ensure that it maintains a constant, uniform pressure on the nozzles.
3. Install screens between the tank and the nozzles and clean them frequently to prevent clogging.

4. Use an adjustable distributor that can deliver controlled amounts of bituminous material from 0.04 to 1.0 gal/yd², ± 0.02 gal/yd² (0.18 to 4.53 L/m², ± 0.10 L/m²) up to 24 ft (7.2 m) wide without atomization, streaking, or pulsation in the flow.
5. Use a distributor equipped with the following:
 - A tachometer and thermometers to indicate the application rate and the temperature of the tank contents
 - Measuring devices to accurately indicate the amount of bituminous material, in gallons (liters), in the distributor before and after each application
 - Full circulating spray bars that can be adjusted laterally to conform to a stringline and capable of vertical and horizontal adjustment.
 - A positive shut-off control to prevent dripping bituminous material on the roadway
 - A distributor tank equipped with a sample valve in a safe and convenient location to obtain bituminous material samples

C. Heating Equipment

Ensure that heating equipment will heat and maintain the bituminous material uniformly at the temperature required. Provide an accurate thermometer.

D. Steel-Wheeled Rollers

Use self-propelled, tandem-type steel-wheeled rollers. The rollers shall weigh from 3 to 8 tons (3 to 7 Mg). Ensure that the roller weights within these limits can properly seat the aggregate without fracturing the aggregate particles. Equip the roller drums with scrapers to prevent pick up of material. Combination rollers with pneumatic-tired wheels that can be alternated with a steel drum are permitted as a substitute for steel-wheeled rollers.

E. Pneumatic-Tired Rollers

Use self-propelled, two axles, pneumatic-tired rollers with smooth-tread rubber tires aligned such that gaps between the tires on one axle are covered by the tires of the other axle. Equip the roller tires with scrapers and scrubbers to prevent pick up of material. Ensure that all tires are of the same size and ply rating and inflated to a minimum of 60 psi (415 kPa). Maintain tire pressure such that the difference in pressure between any two tires does not exceed 5 psi (35 kPa). Provide ballast as directed by the Engineer.

F. Power Broom and Power Blower

Provide at least one power broom and one power blower, or a combination power broom and blower that can remove dust or loose materials from the road surface.

424.3.03 Preparation

Firmly compact, finish, and prime new bases. Ensure that the bases conform to the lines, grades, and cross sections within the tolerances specified.

A. Removing Foreign Material

Use power brooms, power blowers, hand brooms, or other means to remove loose material, dust, dirt, clay, and other materials that prevent bituminous materials from adhering to the base.

Take special care to clean the outer edges thoroughly. Where necessary, use a motor grader blade to remove excess material off the paving edge.

B. Condition of Prime

Check the condition of prime as follows:

1. Ensure the prime is cured before placing the mat course.
2. Repair the prime if it is loose, soft, unbonded, removed, or damaged.

3. Remove concentrations of excess prime.
4. Perform additional rolling with a pneumatic-tired roller before surface treatment when directed by the Engineer.

424.3.04 Fabrication

General Provisions 101 through 150.

424.3.05 Construction

A. Observing Seasonal and Weather Limitations

Apply bituminous surface treatment only between April 15 and October 15 and only when:

- Ambient temperature has not been less than 45 °F (7 °C) for 48 hours immediately prior to application.
- No forecast of ambient temperature less than 45 °F (7 °C) for 48 hours immediately following application.
- Ambient temperature and road surface temperature is at least 60 °F (16 °C) and stable at the time of application.

No exceptions are permitted except as authorized by the Engineer.

Do not apply asphalt cement to a wet surface.

NOTE 1: When the relative humidity exceeds 80%, the ambient temperature exceeds 95 °F (35 °C), the pavement temperature exceeds 125 °F (52 °C) or the weather is windy or overcast, application of bituminous surface treatment will be at the discretion of the Engineer.

NOTE 2: If hot mix asphaltic concrete will be applied over the surface treatment, the Engineer may waive the seasonal limitations providing that traffic is not permitted on the surface treatment until it is covered with hot mix asphaltic concrete.

B. Using PG 64-22 or CRS-3

Only use PG 64-22 or CRS-3 when directed by the Engineer due to a problem with excessive aggregate pickup during high ambient temperature.

C. Observing Sequence of Operations and Quantities of Materials

The sequence of operations and quantities of materials are shown in [Table 1](#), [Table 2](#) and [Table 3](#) ([Table 1a—metric](#), [Table 2a—metric](#) and [Table 3a—metric](#)).

The Engineer will determine the material quantities to be used during construction and may change the minimum or maximum application rate of any course during construction if the total quantities are within the amounts shown in the Tables. Any deviation from the table quantities will require a negotiated adjustment of the Contract price authorized by an approved Supplemental Agreement.

When a single application of bituminous surface treatment is used as a Crack-Relief Interlayer, use the quantities of materials shown in [Table 2](#) ([Table 2a—Metric](#)).

When a sand seal application is Specified, use the quantities of materials shown in [Table 3](#) ([Table 3a—Metric](#)).

Notes:

1. Target application rates for bituminous material, coarse aggregate and seal sand will be established by the Engineer within the limits shown in Table 1, based on roadway and traffic conditions.
2. Do not apply bituminous material or aggregate outside the specified minimum and maximum application rates regardless of the control tolerances shown for each application unless directed by the Engineer in accordance with No. 3 below.
3. At the Engineer's direction, application rates for bituminous materials and aggregate may be varied outside the specified limits for each course at no additional cost provided the combined total of materials is within the specified total minimum and total maximum application rates for the combined total of all courses.
4. Maintain the control tolerances shown above or stop the work until the necessary corrections are made.
5. Apply at least one seal coat to the mat course on the same day when multiple applications are specified.

Section 424—Bituminous Surface Treatment, Crack-Relief Interlayer – Table 2

Bituminous Material Application (gal/yd ²)	Application Rate	Control Tolerance
PG 58-22 or PG 64-22	.20 – .27	± .02
CRS-2h, CRS-2L or CRS 3	.25 – .35	± .02
Aggregate Application (ft ³ /yd ²)	Application Rate	Control Tolerance
#89	.14 – .18	± .02
#7	.18 – .26	± .02

Notes:

- Target application rates for bituminous material and aggregate will be established by the Engineer within the limits shown in Table 2.
- When single surface treatment stone size No. 89 or No. 7 is applied over a milled surface, the minimum application rate for CRS-2h, CRS-2L or CRS 3 shall be 0.30 (gal/yd²) and for PG 58-22 or PG 64-22 shall be 0.22 (gal/yd²).
- Do not apply bituminous material or aggregate outside the specified minimum and maximum application rates regardless of the control tolerances shown for each application.
- Maintain the control tolerances shown above or stop the work until the necessary corrections are made.
- Cover the single surface treatment Crack-Relief Interlayer with HMA Leveling on the same day.

Section 424—Bituminous Surface Treatment, Sand Seal – Table 3

Aggregates	Application Rate (ft ³ /yd ²)	Control Tolerance	Bituminous Material	Application Rate (gal/yd ²)	Control Tolerance
#6	.30 – .42	± .02	CRS-2h, CRS-2L or CRS 3	.23 – .35	± .02
			PG 58-22 or PG 64-22	.20 – .30	± .02

Total Bituminous Materials (L/m ²) PG58-22 or PG64-22		± .09	.77-.86	.82-1.13	1.00-1.36	± .14	1.72-2.31	2.26-2.94	± .18	2.63-3.67	2.81-4.53
CRS-2h, CRS-3		± .09	.91-1.00	.95-1.31	1.13-1.58	± .14	1.99-2.72	2.63-3.44	± .18	3.04-4.30	3.26-4.53
Total Stone (m ³ /m ²)		± .001	.005-.006	.006-.009	.01-.014	± .0013	.011-.015	.016-.024	± .0016	.021-.029	.025-.033

Notes:

1. Target application rates for bituminous material, coarse aggregate and seal sand will be established by the Engineer within the limits shown in Table 1a, based on roadway and traffic conditions.
2. Do not apply bituminous material or aggregate outside the specified minimum and maximum application rates regardless of the control tolerances shown for each application unless directed by the Engineer in accordance with No. 3 below.
3. At the Engineer's direction, application rates for bituminous materials and aggregate may be varied outside the specified limits for each course at no additional cost provided the combined total of materials is within the specified total minimum and total maximum application rates for the combined total of all courses.
4. Maintain the control tolerances shown above or stop the work until the necessary corrections are made.
5. Apply at least one seal coat to the mat course on the same day when multiple applications are specified.

Section 424—Bituminous Surface Treatment, Crack-Relief Interlayer – Table 2a (Metric)

Bituminous Material Application (L/m ²)	Application Rate	Control Tolerance
PG 58-22 or PG 64-22	.91 – 1.22	± .09
CRS-2h, CRS-2L or CRS 3	1.13 – 1.58	± .09
Aggregate Application (m ³ /m ²)	Application Rate	Control Tolerance
#89	0.005 – 0.006	± .0007
#7	.006 – .009	± .0007

Notes:

- Target application rates for bituminous material and aggregate will be established by the Engineer within the limits shown in Table 2a.
- When single surface treatment stone size No. 89 or No. 7 is applied over a milled surface, the minimum application rate for CRS-2h, CRS-2L or CRS 3 shall be 1.36 (L/m²) and for PG 58-22 or PG 64-22 shall be 1.00 (L/m²).
- Do not apply bituminous material or aggregate outside the specified minimum and maximum application rates regardless of the control tolerances shown for each application.
- Maintain the control tolerances shown above or stop the work until the necessary corrections are made.
- Cover the single surface treatment Crack-Relief Interlayer with HMA Leveling on the same day.

Section 424—Bituminous Surface Treatment, Sand Seal – Table 3a (Metric)

Aggregates	Application Rate (m ³ /m ²)	Control Tolerance	Bituminous Material	Application Rate (L/m ²)	Control Tolerance
#6	0.0102 – 0.0142	± .0007	CRS-2h, CRS-2L or CRS 3	1.04 – 1.58	± .09
			PG 58-22 or PG 64-22	0.91 – 1.36	± .09
#7	0.0061 – 0.0088	± .0007	CRS-2h, CRS-2L or CRS 3	0.95 – 1.31	± .09
			PG 58-22 or PG 64-22	0.81 – 1.13	± .09
#89	0.0047 – 0.0061	± .0007	CRS-2h, CRS-2L or CRS 3	0.91 – 1.00	± .09
			PG 58-22 or PG 64-22	0.77 – 0.86	± .09
WA 10 Washed Screenings	0.0034 – 0.0047	± .0007	CRS-2h, CRS-2L or CRS 3	0.45 – 1.13	± .09
			PG 58-22 or PG 64-22	0.45 – 0.77	± .09

Notes:

1. Target application rates for bituminous material, coarse aggregate and seal sand will be established by the Engineer within the limits shown in Table 3a, based on roadway and traffic conditions.
2. Do not apply bituminous material or aggregate outside the specified minimum and maximum application rates regardless of the control tolerances shown for each application unless directed by the Engineer in accordance with No. 3 below.
3. At the Engineer’s direction, application rates for bituminous materials and aggregate may be varied outside the specified limits for each course at no additional cost provided the combined total of materials is within the specified total minimum and total maximum application rates for the combined total of all courses.
4. Maintain the control tolerances shown above or stop the work until the necessary corrections are made.
5. Cover the coarse aggregate seal stone with seal sand on the same day.

D. Heating Bituminous Material

Evenly heat the entire mass of bituminous material for each application under positive control. While the material is being applied, maintain it within the specified temperature range.

E. Applying Bituminous Material

The following are temperatures at which bituminous material shall be applied.

Bituminous Material	Asphalt Cement	CRS-2h	CRS-3	CRS-2L
Application temperature °F (°C)	275–350 (135–177)	140–180 (60–82)	140–180 (60–82)	140–180 (60–82)

NOTE 1: Do not store emulsified asphalts at temperatures exceeding 150 °F (65 °C) for any extended time.

NOTE 2: Do not place bituminous surface treatment on fresh asphaltic concrete, except for paved shoulders, until the asphaltic concrete has been in place at least 30 days.

The Engineer will designate the maximum area to which bituminous material may be applied at one time. Apply the material as follows:

1. After applying the bituminous material to the section, immediately cover it with the correct application rate of aggregate before beginning the next section.

Do not apply the bituminous material to the full width of the pavement unless the aggregate spreader can immediately cover the full width of the applied material.

NOTE: Never allow bituminous material to chill, set up, dry, or reach a condition that impairs the retention of cover aggregate before the aggregate is applied.

2. When a longitudinal joint is necessary:
 - Do not overlap the applications more than 4 in (100 mm).
 - Do not leave any area uncovered.
 - Never allow excess quantities of bituminous materials to build up.
3. On curves that require widening:
 - a. Shoot the extra width on the outside first.
 - b. Shoot the normal width with the distributor and follow the inside paving edge.
4. Ensure that the spray of bituminous material is uniform at all times. If the spray is not uniform:
 - a. Stop the work.
 - b. Change equipment, personnel, or methods to attain the required uniformity.
 - c. Apply bituminous material at one-half the width of the roadway, if necessary.
5. If streaking develops:
 - a. Stop the distributor and correct the problem before proceeding.
 - b. Use a hand hose or a hand pouring pot to cover the streaked areas at approximately the same application rate of bituminous material.
6. If a part of the work cannot be reached by the distributor, treat it by hand hoses with nozzles.
7. Protect curbs, gutters, handrails, and other structures from discoloration by the bituminous material. Remove bituminous material that is sprayed or spilled on these structures.
8. Ensure that the bituminous material joins neatly in place by beginning and ending the asphalt application from a heavy paper or tight trough that is longer than the width of the treatment being applied. Place it to catch and hold the surplus material.
9. When cleaning and emptying the distributor, empty it where the bituminous material can be covered with dirt and completely disposed of without damaging the Rights-of-Way.

F. Spreading Aggregates

Spread the aggregates as follows:

1. Ensure that aggregates do not contain free moisture when spread.
2. Apply aggregate immediately after applying bituminous materials.
3. Uniformly spread the aggregate at the specified rate without corrugations, overlaps, excess, or deficient areas.
4. Move the spreader at a uniform speed, regardless of the grade.
5. Ensure that the distance that the aggregate free falls remains constant during spreading.
6. Remove corrugations. Operate the spreader to prevent overlap of aggregates. If overlap occurs, remove the excess aggregate before rolling.
7. Ensure a uniform aggregate spread by hand spotting and brooming as necessary.

G. Rolling

Observe the following guidelines for rolling bituminous surface treatment:

1. Synchronize the speed of the distributor and aggregate spreader with that of the rolling operation.
2. Use a minimum of two (2) individual rollers, one of which must be a pneumatic-tired roller meeting the requirements of Subsection 424.3.02.E.
3. If a steel-wheeled roller will fracture the aggregate, use pneumatic-tired rollers only.
4. Begin rolling within one minute after spreading the aggregate.
5. Operate rollers at speeds not exceeding 5 mph.
6. Proceed in a longitudinal direction, beginning at the outside edge of the aggregate application.
7. A roller pass is defined as one trip in a single direction.
8. Overlap each roller pass by approximately 1/2 the roller width.
9. Provide a minimum of three (3) roller passes per roller for each layer of aggregate to properly embed the aggregate particles.

<p>Note: Unless a sufficient number of rollers are in operation to complete the above requirements, do not make subsequent applications of bituminous material until rolling of the previous application is completed.</p>

H. Brooming

Use a revolving broom as necessary, supplemented by hand brooming, to remove or redistribute excess stone. Sweep the completed surface treatment within the first three hours of the next available workday following placement. Take care not to unseat bonded stone when sweeping.

I. Controlling Traffic

Do not allow traffic on the surface treatment until the bituminous material has cured sufficiently to ensure that the aggregate will not be loosened, dislodged, or whipped off by slow moving traffic.

Control traffic to speeds not exceeding 25 mph for a minimum of two hours after application of the seal stone and until the Engineer permits the road to be opened to normal traffic speeds.

Use pilot vehicles to control traffic speeds.

424.3.06 Quality Acceptance

General Provisions 101 through 150.

424.3.07 Contractor Warranty and Maintenance

Maintain and protect the surface course as specified in [Section 105](#) until the Project has been accepted. Make repairs as the Engineer directs. The cost of maintenance, protection, and repair is included in the Unit Prices Bid for the Item for which they apply.

424.4 Measurement

The area to be measured is the number of square yards (meters) of each type surface treatment completed and accepted.

424.4.01 Limits

The length is measured along the surface. The width is specified on the Plans, plus or minus any authorized changes. Irregular areas are measured by the surface square yard (meter) within the lines shown on the Plans or authorized changes.

424.5 Payment

The accepted area of surface treatment will be paid for at the Contract Unit Price per square yard (meter) complete for each type and stone size specified.

Payment will be made under:

Item No. 424	Single surface treatment stone size __ group__	Per square yard (meter)
Item No. 424	Double surface treatment stone size __ and __ group __	Per square yard (meter)
Item No. 424	Double surface treatment stone size __ and __ group __ with Seal Sand __ and Latex-Modified Emulsion	Per square yard (meter)
Item No. 424	Double surface treatment stone size __ and __ group __ with Seal Sand____	Per square yard (meter)
Item No. 424	Triple surface treatment stone sizes __, __ and __, group __	Per square yard (meter)

424.5.01 Adjustments

General Provisions 101 through 150.

Section 426—Sprinkle Overlay Treatment

426.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 427—Emulsified Asphalt Slurry Seal

427.1 General Description

This work includes placing slurry seal. Emulsified asphalt slurry seal is a thin application of a mixture of fine non-plastic aggregate, emulsified asphalt, mineral filler, and water.

427.1.01 Definitions

General Provisions 101 through 150.

427.1.02 Related References

Section 882—Lime

Section 883—Mineral Filler

B. Referenced Documents

GDT 91

GDT 43

427.1.03 Submittals

A. Slurry Seal Design

At least two weeks before beginning the work, submit to the Office of Materials (OM) design samples of each ingredient to be used in the slurry seal mix. Include in the samples information concerning sources, type of materials, and project number. Do not begin slurry seal work until the OMR has approved the slurry mix design.

Submit the slurry seal mix design that will be used on the Project to the Engineer.

B. Equipment Calibration

Before placing slurry seal, furnish the Engineer with a calibration of the slurry mixing equipment.

427.2 Materials

Ensure that the materials to be used meet the following specifications:

A. Aggregate

Ensure that the aggregate used in emulsified asphalt slurry seal meets the requirements of Subsection 802.2.01. Except, use aggregate manufactured from Group II, Class A or B crushed stone or slag with a sand equivalent value of at least 50.

Ensure that the aggregates shipped to the project are uniform and do not require blending or premixing at the storage area before use.

B. Mineral Filler

Material	Section
Portland Cement	830 and 883
Hydrated Lime	882 and 883

C. Emulsified Asphalt

Material	Section
Emulsified Asphalt: SS-1h	822
Cationic Asphalt Emulsion: CSS-1h	824

D. Water

Ensure that water for slurry seal mixtures is clear and free of oil, salt, acid, alkali, organic, and other harmful substances.

The Engineer may require a water sample be sent to the OMR for evaluation before work begins on the Project.

E. Mixture Composition

Use an emulsified asphalt slurry seal that is a uniform mixture of aggregate, emulsified asphalt, mineral filler, and water.

Section 427-Emulsified Asphalt Slurry Seal

The Engineer may require any element to be adjusted or replaced to produce an acceptable slurry seal. Proportion the elements to produce a uniform mixture that meets the requirements of the Table below:

Emulsified Asphalt Slurry Seal Mixture		
Mixture Control Tolerances, %	Sieve Size	% Passing
±0	3/8 in (9.5 mm)	100
±6	No. 4 (4.75 mm)	90 to 100
±5	No. 8 (2.36 mm)	65 to 90
±4	No. 50 (300 μm)	20 to 45
±3	No. 200 (75μm)	8 to 16
Design Requirements		
±0.75	Range for percent residual asphalt	*7.5 to13.5
±0.2 (5)	Flow inch (mm), GDT 91	1 (25)
n/a	Wear lb/ft ² (g/m ²)GDT 43 maximum	0.220 (1075)
*Percent residual asphalt is based on weight of the dry aggregate.		

Emulsified asphalt slurry seal is used to seal small cracks and correct moderate surface condition. Apply this type at a rate of 10 to 20 lbs/yd² (5.5 to 11 kg/m²) based on dry aggregate weight.

If more than 20 lbs/yd² (11 kg/m²) of emulsified asphalt slurry seal is required, apply additional lifts of the same mixture.

Maintain the gradation and percent residual asphalt as shown on the slurry seal design or as established by the Engineer within the mixture control tolerances listed.

427.2.01 Delivery, Storage, and Handling

A. Transporting and Storing Asphalt Emulsions

Transport asphalt emulsions using containers free of foreign material. Asphalt emulsion will not be accepted if a transporting vehicle has leaked or spilled during transit.

Store the asphalt emulsion in stationary rail or truck tanks that can be used to fill the slurry seal truck tanks. Equip the storage and truck tanks to prevent water from entering the emulsion. Provide heat if necessary to prevent freezing.

B. Stockpiling Aggregates

Stockpile the aggregate in an area that drains readily. Take precautions to prevent stockpile contaminations such as soil, vegetation, or oversize rock. Load the aggregate on to the slurry seal trucks without segregating it.

427.3 Construction Requirements

427.3.01 Personnel

General Provisions 101 through 150.

427.3.02 Equipment

Equipment, tools, and machines used to perform this work are subject to the Engineer's approval. The Engineer may discontinue the work if more equipment and tools are needed to place the materials. Do not use malfunctioning equipment to perform the work.

A. Slurry Mixing Equipment

Before slurry seal placement begins, furnish the Engineer with a calibration of the slurry mixing equipment. Ensure that the mixing machine is equipped with the following:

- Revolution counter to count the feeder belt revolutions continuously or intermittently as desired by the Engineer
- Water pressure system and a fog-type spray bar to fog the surface prior to spreading the slurry mix
- Continuous flow mixing unit that can deliver a predetermined proportion of aggregate, water, mineral filler, and asphalt emulsion to the mixing chamber and discharge the thoroughly mixed product continuously

Pre-wet the aggregate and mineral filler in the machine immediately before mixing it with the emulsion.

NOTE: Use caution when mixing to ensure that the emulsion does not set up prematurely.

B. Slurry Spreading Equipment

Use a mechanical squeegee spreader with a flexible strike-off that contacts the surface (ensure that the spreader is adjustable to spread evenly and to prevent loss of slurry on varying grades and crowns)

Use a spreader equipped with augers, a steering device, a flexible strike-off, and a device to adjust the coverage width.

Keep the spreader box clean and free of asphalt and aggregate build-up. The type of flexible strike-off and the burlap drags or other drags are subject to the Engineer's approval.

C. Cleaning Equipment

Ensure that power brooms, power blowers, air compressors, water flushing equipment, and hand brooms can thoroughly clean cracks and the old surface.

D. Auxiliary Equipment

Provide hand squeegees, hand brooms, shovels, and other equipment needed to perform the work.

427.3.03 Preparation

Immediately before applying the slurry:

1. Remove loose material, silt spots, vegetation, and other objectionable material from the pavement. If the pavement has considerable cracks, do not flush it with water.
2. Prepare the surface as specified in the Standard Specifications for slurry seal.

427.3.04 Fabrication

General Provisions 101 through 150.

427.3.05 Construction

A. Observe Weather Limitations

Do not apply slurry seal if the pavement or ambient temperature is 55 °F (13 °C) or below and falling. If both the ambient and pavement temperatures are 45 °F (7 °C) or above and rising, the slurry seal may be applied.

If the relative humidity exceeds 80 percent or the weather is overcast, the Engineer will determine when to apply the slurry seal.

B. Apply Tack Coat

Before placing the slurry seal, apply a bituminous tack coat consisting of one part emulsion and three parts water to the old surface as follows:

1. Apply a tack coat with the same asphalt emulsion type and grade as used in the slurry seal.
2. Apply the tack coat according to Section 413.
3. Apply the tack coat with an asphalt distributor.
4. Apply the tack coat at a rate of 0.05 to 0.10 gal/yd² (0.23 to 0.46 L/m²) of the diluted emulsion. The Engineer will determine the exact application rate.

C. Prepare the Mix

Prepare the mix as follows:

1. Thoroughly mix the material proportions approved for use. Do not mix for more than four minutes.
2. Adjust the amount of water or mineral filler to reach the desired consistency.
3. If the proper slurry consistency cannot be maintained, stop the work and correct the problem by changing the proportions or material sources.

D. Apply the Slurry Seal

Place the slurry seal uniformly across the width of the traffic lane unless otherwise specified or directed by a Special Provision in the proposal or the Engineer. Carry enough slurry seal in the spreader to completely cover the surface. Apply the slurry seal as follows:

1. Adjust the squeegee action to permit the mix to flow freely and leave a smooth surface.
2. If local conditions require, pre-wet the surface with water by fogging ahead of the slurry box. Closely control pre-wetting to prevent water runoff or puddling.
3. Do not deposit slurry mixture that is not the desired consistency.
4. After depositing the slurry, do not add additional elements.
5. Prevent the following:
 - Lumping, balling, or unmixed aggregate
 - Segregation of the emulsion and aggregate fines from the coarse aggregate
 - Excessive buildup or unsightly appearance on longitudinal or transverse joints
6. If the coarse aggregate settles to the bottom of the mix, remove the slurry from the pavement.
7. Place longitudinal joints on two-lane roadways as close to the center of the pavement as possible.
If the roadway has more than two lanes of traffic, place the longitudinal joints as close as possible to where traffic stripes will be placed.

E. Apply by Hand

Use approved squeegees to spread slurry in areas that are not accessible to the slurry spreader. Do not leave unsightly marks from the hand work.

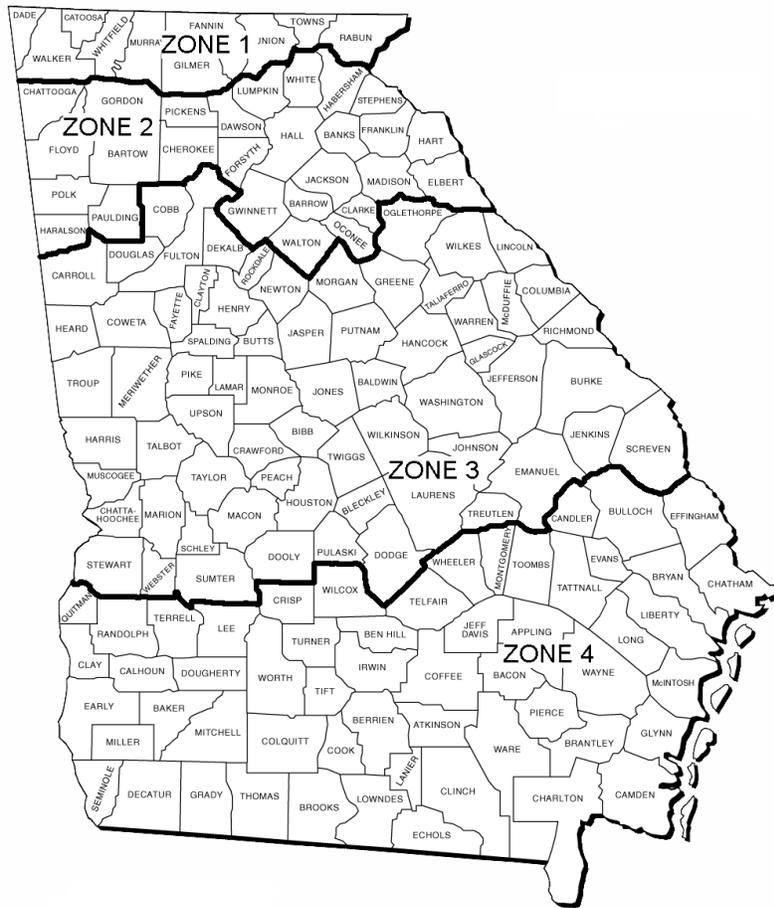

F. Control Traffic

Do not allow traffic on the slurry seal until it has cured enough to withstand marring and tearing, and until no water will be pumped to the surface. Control traffic as necessary to prevent damage to the slurry. Repair any traffic damage to the slurry seal at the Contractor’s expense.

G. Observe Seasonal Limitations

Apply slurry seal between the dates given in the Table below. The dates are given by zones shown on the Georgia Geographic Map, below. The Engineer shall authorize any exceptions.

Zones	Dates
1	April 15 – October 1
2	April 10 – October 25
3	April 1 – October 31
4	April 1 – October 31

Georgia Department of Transportation Geographical Map for Slurry Seal

427.3.06 Quality Acceptance

General Provisions 101 through 150.

427.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

427.4 Measurement

Emulsified asphalt slurry seal is measured by the square yard (meter) complete in place and accepted. The lengths and widths to compute square yards (meters) are specified in Section 109.

Diluted emulsified tack coat is measured and paid for according to Section 413.

427.4.01 Limits

General Provisions 101 through 150.

427.5 Payment

Emulsified asphalt slurry seal is paid for at the full Contract Price per square yard (meter) and is full compensation for furnishing materials, including bituminous materials, equipment, work, and labor.

Payment will be made under:

Item No. 427	Emulsified asphalt slurry seal type ____ stone, Group II	Per square yard (meter)
--------------	--	-------------------------

427.5.01 Adjustments

General Provisions 101 through 150.

Section 428—Micro Surfacing

428.1 Description

This work covers the materials, equipment, construction, and application procedures for placing micro-surfacing material for filling ruts and surfacing existing paved surfaces. Properly proportion, mix, and spread all ingredients on the paved surface according to this Specification and as directed by the Engineer.

428.1.01 Definitions

General Provisions 101 through 150.

428.1.02 Related References

A. Standard Specifications

[Section 413—Bituminous Prime](#)

Section 424—Bituminous Surface Treatment

Section 824—Cationic Asphalt Emulsion

B. Referenced Documents

GDT 125

428.1.03 Submittals

A. Invoices

When the Department requests, furnish formal written invoices from a supplier for all materials used in production of micro surfacing. Show the following on the invoice(s):

- Date shipped
- Quantity in tons (megagrams)

Purchase LRA-modified emulsion from a supplier who will provide copies of invoices upon the Department’s request.

B. Mix Design

Submit the proposed mix design for approval at least two weeks before beginning the mixing operations. As a minimum, the design shall include the following:

- Aggregate test properties
- Aggregate target gradation
- Results of Table 1 mixture design properties
- Design percent asphalt residue based on dry weight of the aggregate
- Mineral filler percentages based on dry weight of the aggregate
- Quantitative effects of moisture content on the unit weight of the aggregate (bulking effect)

Submit to the Office of Materials (OM) representative samples of each ingredient to be used in the micro-surfacing mixture for design verification at least two weeks before beginning mixing operations. Include information about sources, type of materials, and project number.

Do not begin micro-surfacing work until the OMR has approved the micro-surfacing design and accepted the mixture.

The Engineer’s acceptance of the design is solely for quality control and does not release the Contractor from performing acceptable work under this Specification.

Ensure the mixture has sufficient working life to allow for proper placement at the existing ambient temperature and humidity. Redesign the mixture if a constituent must be replaced, or gradation changed, in order to produce an acceptable mixture. Proportion the constituents to produce a uniform mixture meeting the requirements of Table 1 .

Table 1—Mixture Design Properties

Micro-Surfacing		Type I	Type II
Mixture Control Tolerances	Grading Requirements	Percent Passing	Percent Passing
±0%	3/8-inch (9.5 mm)	100	100
±6%	No. 4 (4.75 mm)	90-100	60-95
±5%	No. 8 (2.36 mm)	65-90	45-75
±4%	No. 50 (300 μm)	20-45	15-35
±3%	No. 200 (75 μm)	5-15	5-15
	Design Requirements	Range	Range

N/A	Mineral Filler, %	0.5-3.0	0.5-3.0
Design Requirements – Micro Surfacing Type I and Type II			
Test No.	Description	Specification	
AASHTO T-245 (Modified)	Flow	6-16	
AASHTO T-245 (Modified)	Min. Stability, lb (kg), 50 Blow Marshall	1800 (8000)	
ISSA TB-100	Wet Track Abrasion Loss (Maximum)	6-day soak	1 lb/yd ² (538 g/m ²)
		1-hour soak	1.5 lb/yd ² (807 g/m ²)
ISSA TB-147A or 147C	Vertical Displacement (Maximum)	10%	
ISSA TB-109	Excess Asphalt by LWT (Maximum)	1 lb/yd ² (538 g/m ²)	
ISSA TB-113	Mixing Time Test @ 100°F (38 °C) (Minimum)	45 Seconds	
ISSA TB-139	Set Time Test (Minimum)	@ 30 minutes	12 kg-cm
		@ 60 minutes	20 kg-cm
ISSA TB-102	Water Resistance Test @ 30 Minutes	No Discoloration	
ISSA TB-114	Wet Stripping Test (Minimum Retained)	90%	
ISSA TB-115	System Compatibility	Pass	

Note 1: Base percent residual asphalt and percent mineral filler on weight of the dry aggregate.

Note 2: Maintain the gradation and percent residual asphalt as shown on the micro-surfacing design or as established by the Engineer within the listed Mixture Control Tolerances. Meet mix control tolerances or make immediate adjustments to bring the gradation and percent residual asphalt back within tolerances, or the work will not be allowed to continue.

Note 3: Modify procedures stated in AASHTO T-245 for determining Flow and Marshall Stability to permit air drying of the mixture at 70 - 77 °F (21 - 25 °C) for 3 days before reheating and fabricating Marshall specimens.

428.2 Materials

The materials to be used and their specifications are listed below:

A. Aggregate

Use aggregate in micro-surfacing that meets the requirements of Subsection 802.2.02.

EXCEPTION: Aggregate shall be manufactured from Group II, Class A or B crushed stone or slag, and the Sand Equivalent Value shall not be less than 65 when tested according to AASHTO T-176.

Ensure that aggregates shipped to the project are uniform and do not require blending or pre-mixing at the storage area before use. Aggregates must meet the appropriate gradation as shown in Table 1 .

B. Mineral Filler

Use mineral filler that is Portland cement or hydrated lime which meets the following requirements:

Portland cement	Section 830 and 883
Hydrated Lime	Section 882 and 883

C. Cationic Asphalt Emulsion

Ensure that the emulsified asphalt is a cationic type CSS-1h(LRA) or CSS-1P that meets the requirements for CSS-1h of Section 824, modified to waive the cement-mixing test.

D. Latex Rubber Additive (LRA)

Ensure the LRA is a natural latex or an unvulcanized styrene-butadine rubber in an emulsified latex form. Provide certification from the LRA manufacturer that the LRA meets the following requirements:

Rubber Solids content, Minimum %, ASTM D 1417	60 (by weight)
Brookfield Viscosity, cps Maximum, ASTM D 1417	5000
Total Ash, Maximum %, ASTM D 297	3.5

Co-mill the LRA and the special emulsifiers with the asphalt cement while manufacturing the emulsified asphalt to produce a homogeneous mixture. Add the LRA in the necessary proportions to result in 3% neat latex by weight of residual asphalt cement in the emulsion. Ensure the LRA modified emulsified asphalt, when left undisturbed for 24 hours, shows no separation of emulsion and LRA and no color striations, but has a uniform color throughout.

Ensure that the residue from the LRA modified emulsified asphalt has a minimum softening point of 135 °F (60 °C) when tested according to AASHTO T-53.

EXCEPTION: The maximum test temperature shall not exceed 350° F (176°C) and the duration shall not exceed 20 minutes.

Formulate the emulsified asphalt to allow the paving mixture to cure at a rate that will permit traffic on the pavement within 1 hour after application without damaging the pavement surface.

E. Bituminous Tack Coat

Use a cationic asphalt emulsion CSS-1h or CQS-1h for the bituminous tack coat that meets Section 824 and is diluted according to Subsection 428.3.05.D.

F. Water

Use water for the micro-surfacing mixture that is potable and free of contaminants detrimental to the mixture.

G. Other Additives

Provide other additives as required to control the set time of the mixture in the field.

428.2.01 Delivery, Storage, and Handling

A. Aggregate Storage

Store or stockpile mineral aggregates in a manner that will prevent segregation, mixing of the various materials or sizes, and contamination with foreign materials. Do not use construction equipment on, or to ramp the stockpiled aggregate. Pass the aggregate over a scalping screen immediately before transferring it to the micro-surfacing mixing machine to remove oversized material.

B. Storage of Bituminous Material

Ensure that the bituminous storage is adequate to meet the requirements of the production rate. Always keep clean all equipment used to store and handle bituminous material and operate it in such a manner to prevent contamination with foreign matter.

428.3 Construction Requirements

428.3.01 Personnel

General Provisions 101 through 150.

428.3.02 Equipment

Obtain the Engineer's approval for all equipment, tools, and machines used to perform this Work. Do not attempt work with malfunctioning equipment. The Engineer may stop the work if equipment and tools are not sufficient to place the materials satisfactorily.

A. Mixing Equipment

Blend the paving mixture using a self-propelled micro-surfacing mixing machine that is:

- A continuous flow mixing unit
- Able to accurately deliver and proportion the aggregate, LRA-modified emulsion, mineral filler, field control additives, and water to a revolving multi-blade, twin shafted mixer
- Able to Discharge the mixed product on a continuous flow-

EXCEPTION: Blending the paving mixture may be accomplished with a truck mounted micro-surfacing mixing machine that meets the above specification, except for continuous flow, when placing the mixture on short streets or projects that are less than one-half mile (800 m) in length.

For streets or projects less than one-half mile (800 m) in length, individual truck-mounted units may be used for placement of micro-surfacing. For streets or projects one-half mile (800 m), or greater, in length, place micro-surfacing mixture with a machine that is equipped as follows:

- Has self-loading devices that load raw materials while continuing to lay micro-surfacing, thereby minimizing construction joints
- Has opposite side driving stations to optimize longitudinal alignment
- Allows the operator to have full hydrostatic control of the forward and reverse speed while applying micro-surfacing material

Thoroughly blend the mixture so that no uncoated aggregate is visible upon discharge from the mixing unit or in samples taken from the roadway.

1. Water Pressure System

Use a mixing machine equipped with a water pressure system and nozzle-type spray bar to provide a water spray ahead of and outside the spreader box when required.

2. Proportioning Devices

Use a machine equipped with individual volume or mass controls or other gauging devices for measuring and proportioning each material added to the mix. Properly calibrate, mark, and positively interlock each material control device.

Ensure that the aggregate feed to the mixer is equipped with a revolution counter or similar device to determine the amount of emulsion used at any time. Before beginning the work, calibrate each mixing unit and provide a copy of the calibration worksheet to the Engineer. Once calibrated, do not change the aggregate and emulsion flows without the Engineer's approval. The water and additive may be adjusted in the field to control the mix properties to produce an acceptable mix.

3. Emulsion Pump

The emulsion pump shall be a heated, positive displacement type pump.

4. Spreading Equipment

Uniformly spread the micro-surfacing mixture using a mechanical-type spreader box attached to the mixer, equipped with paddles or other devices to agitate and spread the materials throughout the box. Use paddles that are designed to maintain sufficient turbulence in the mixture to prevent the material from setting-up in the box or causing side buildup and lumps. Provide a front seal to prevent loss of the mixture at the road contact surface.

Provide an adjustable rear seal to act as a strike-off. Maintain the spreader to prevent the loss of the paving mixture during surfacing super-elevated curves. Design and operate the spreader box and rear strike-off to achieve a uniform consistency and produce a free flow of material to the rear strike-off without causing skips, lumps, or tears in the finished surface. Use a spreader box capable of lateral movement or with side-shift abilities to ensure proper alignment with the roadway.

B. Auxiliary Equipment

Provide a pressure distributor, power-broom, and power blower which meets requirements of Subsection 424.3.02.

Provide suitable crack and surface cleaning equipment, barricading equipment, hand tools, and other support equipment necessary to perform the work.

428.3.03 Preparation

General Provisions 101 through 150.

428.3.04 Fabrication

General Provisions 101 through 150.

428.3.05 Construction**A. General**

Produce, transport, and place the specified materials according to these specifications and as approved by the Engineer. Produce a finished micro-surfacing that has a uniform texture free from excessive scratch marks, tears, or other surface irregularities. Ensure that the cured mixture fully adheres to the underlying surface. Based on a visual examination or test results, the Engineer may reject any work due to poor workmanship, loss of texture, raveling, or apparent instability.

B. Weather Limitations

Spread the micro-surfacing mixture only when:

- The ambient temperature for 48 hours immediately prior to placement has been at least 50 °F (10 °C).
- The current pavement surface and the ambient temperature is at least 50 °F (10 °C) and rising. Supply a surface temperature thermometer and a sling psychrometer and take temperature and humidity measurements as directed by the Engineer.
- The weather is not foggy or rainy.
- There is no forecast of temperatures below 32 °F (0 °C) within 48 hours from the time of placement.

Whenever the relative humidity exceeds 80 percent or the weather is overcast, the placement of micro-surfacing will be at the discretion of the Engineer.

C. Surface Preparation

Before applying the micro-surfacing mixture, thoroughly clean all cracks and the area to be surfaced to the Engineer's satisfaction.

D. Tack Coat

Use a tack coat which consists of cationic asphalt emulsion CSS-1h or CQS-1h. Dilute it at the rate of one part emulsion and three parts water, and apply with an asphalt distributor. The application rate is 0.05 to 0.10 gal/yd² (0.23 to 0.45 L/m²) of diluted emulsion per square yard (meter). Apply the tack coat according to Section 413. If the surface course is placed within 30 days of the leveling course or if the Engineer determines that excessive tracking of material is evident, a tack coat will not be required between the leveling and surface course.

E. Application

Pre-wet the surface by spraying water ahead of and outside of the spreader box at a rate that dampens the surface without allowing water to flow freely ahead of the spreader box.

Spread the paving mixture on the prepared surface to produce a uniform finished surface. Take care when filling ruts to restore the designed profile of the pavement cross section. Excess crowning or overfilling of the rut area is not permitted. Use squeegees and lutes to spread the mixture in areas inaccessible to the spreader box and areas requiring hand spreading. Carry a sufficient amount of material at all times in all parts of the spreader box to ensure complete coverage.

Make adjustments to the additive, if necessary, to provide a slower setting time during hand spreading. If hand spreading is necessary, pour the mixture in a small windrow along one edge of the surface to be covered and uniformly spread with a hand squeegee or lute. Provide a smooth, neat seam where two passes meet. Immediately remove excess material from the ends of each run.

F. Traffic Control

Do not allow traffic on the micro-surfacing mixture until it has cured sufficiently to prevent pick up or marring of the surface. Repair any damage done by traffic to the mixture at no expense to the Department.

G. Rut Filling and Leveling (Scratch) Course

When required on the Plans, provide micro-surfacing materials to fill ruts, utility cuts, depressions in the existing surface, etc. before the final surface course is placed. When ruts are no more than 1/2 inch (13 mm) in depth, construct the leveling/scratch course using a full width spreader box with a steel strike-off. Fill ruts deeper than 1/2 inch (13 mm) independently with a rut-filling spreader box, 6 ft (1.8 m) in width, or as directed by the Engineer.

Place and open to traffic the rut filling and leveling (scratch) course at least 24 hours before surfacing.

H. Workmanship

Excessive buildup, uncovered areas, or unsightly appearance are not permitted on longitudinal or transverse joints. Place longitudinal joints on lane lines. Excessive overlap is not permitted. Ensure straight lines along the roadway centerline, lane lines, shoulder, or edge lines. Keep lines at intersections straight to provide a neat and uniform appearance.

1. **Finished Surface:** Ensure that the finished micro-surfacing has a uniform texture free of excessive scratch marks, tears, or other surface irregularities. Excessive tear marks are considered 4 marks that are 1/2 inch (13 mm) wide or wider and 6 inches (150 mm) or more long per 100 square yards (85 meters), or any marks 1 inch (25 mm) wide or wider or 4 inches (100 mm) long. Ensure that the edges of the micro-surfacing appear neat and that longitudinal alignment is parallel to the roadway centerline.
2. **Joints and Seams:** Produce neat and uniform longitudinal and transverse joints. Construct transverse joints as butt-type joints. Place longitudinal joints on lane lines when possible. Do not allow gaps between applications. Joints are acceptable if there is no more than a 1/2 inch (13 mm) vertical space for longitudinal joints nor more than 1/4 inch (6 mm) for a transverse joint between the pavement surface and a 4 ft (1.2 m) straightedge placed perpendicular on the joint.
3. **Areas the Mixing Machine Cannot Reach:** Surface these areas using hand tools to provide complete and uniform coverage. Clean and lightly dampen the area to be handworked before placing the mix. Ensure areas that require handwork produce a finished surface that is uniform in texture, dense, and has a neat appearance similar to that produced by the spreader box. Micro-surfacing material required to repair deficiencies due to unsatisfactory workmanship and the work required to mix and place the materials according to the Specifications, will be provided at no expense to the Department.

428.3.06 Quality Acceptance

Take two samples of mixture for determining quality acceptance for each day of operation. Test the second sample only if the results of the first sample are outside mixture control tolerances. Test the samples according to GDT 125. The deviation in test results from the Job Mix Formula will be used to determine compliance with the mixture control tolerances. If more than one sample is tested, the average deviation shall be used to determine compliance.

A mixture adjustment period will be provided during the first two days of operation. If the average deviation of sample results for the first day are outside the mixture control tolerances, you may adjust equipment settings to provide a mixture within the tolerances. Samples will be taken the second day (after equipment changes, if any, have been made) and the average deviation in test results will be calculated. If the average deviation of test results for the second day is within mixture control tolerances, mixture quality will be accepted for the first two days of operation. If the average deviation from the second day is not within mixture control tolerances for percent residual asphalt content, a 2% reduction in unit price will be assessed for each 0.1 percent the residual asphalt content is outside the mixture control tolerances for each of the first two days that tolerances were exceeded.

A. Emulsified Asphalt

Maintain the percent residual asphalt and gradation as shown on the micro-surfacing design, or as established by the Engineer, within the Mixture Control Tolerances listed in Table 1.

After the adjustment period, a 2% reduction in unit price will be applied for each 0.1 percent the residual asphalt content is outside the Mixture Control Tolerance given in Table 1 for the day's production represented by the sample. The average deviation of the samples will be used to determine conformance to the Mixture Control Tolerance. Do not continue to operate and place materials outside the mixture control tolerances. Adjust the placement operation as necessary to maintain production within the tolerances given.

B. Aggregate Application Rate

Control the target spread rate for micro-surfacing to within plus or minus 2 lbs/yd² (1 kg/m²) of the spread rate specified in the Proposal based on the weight of dry aggregate. Mix placed in excess of the upper spread rate tolerance will not be paid for. The unit price will be reduced by 5% for each pound (0.5 kg) of aggregate per square yard (meter) less than the spread rate tolerances established above for each day’s placement of material. Accept pay reduction for deficient daily production, or overlay the deficient area at full plan width and depth at the Contractor’s expense. Do not continue to operate and place materials outside the spread rate tolerances. Adjust the placement operation as necessary to maintain production within the tolerances given.

428.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

428.4 Measurement

A. Micro-Surfacing

Micro-Surfacing, Type I or II surface course, is measured and accepted as completed by the in-place square yard (meter). In computing square yards (meters), the lengths and widths used shall be as specified in Section 109, “Measurement and Payment”.

B. Leveling (Scratch Course)

A leveling (scratch course) is measured and paid for by the ton (megagram) of dry aggregate used. Tons (megagrams) of aggregate used shall be determined using the total daily revolutions of the aggregate feed belt and the corresponding gate setting and weight per revolution shown on the mixing unit calibration worksheet.

C. Tack Coat

Diluted emulsified tack coat is measured and paid for according to Section 413.

428.4.01 Limits

General Provisions 101 through 150.

428.5 Payment

Micro-surfacing will be paid for at the contract unit price, which is full compensation for furnishing all materials, including LRA modified bituminous materials, and for furnishing all equipment, work, and labor.

Payment will be made under:

Item No. 428	Micro-Surfacing, type I	Per square yard (meter)
Item No. 428	Micro-Surfacing, type I leveling	Per ton (megagram)
Item No. 428	Micro-Surfacing, type II	Per square yard (meter)
Item No. 428	Micro-Surfacing, type II leveling	Per ton (megagram)

428.5.01 Adjustments

General Provisions 101 through 150.

Section 429—Rumble Strips

429.1 General Description

This work includes furnishing and placing rumble strips according to Plan details and this Specification.

429.1.01 Definitions

General Provisions 101 through 150.

429.1.02 Related References

A. Standard Specifications

Section 400—Hot Mix Asphaltic Concrete

Section 413—Bituminous Tack Coat

B. Referenced Documents

General Provisions 101 through 150.

429.1.03 Submittals

General Provisions 101 through 150.

429.2 Materials

Ensure that asphaltic concrete conforms to Section 400, Types 12.5 mm Superpave, or 9.5 mm Superpave mixes.

Ensure that the tack coat conforms to Section 413.

429.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

429.3 Construction Requirements

429.3.01 Personnel

General Provisions 101 through 150.

429.3.02 Equipment

A. Hand Rollers

Use nonvibrating hand rollers to compact the strips.

B. Forms

Ensure the form confines and spaces the hot mix according to the Plan details.

429.3.03 Preparation

General Provisions 101 through 150.

429.3.04 Fabrication

General Provisions 101 through 150.

429.3.05 Construction

Complete this procedure to install rumble strips:

1. Tack the entire 20 ft (6 m) strip length.

2. Place the oiled form, and ensure that the first strip coincides with the beginning of the first unit.
3. Place and level the plant mix. Roll the strips with the forms in place.
4. Remove the forms and compact the strips to the Engineer’s satisfaction.
5. Repeat this operation to install the entire 20ft (6 m) rumble strip. Install additional units as designated on the Plans using the same methods and procedures.

NOTE: Do not place strips on wet or frozen pavement.

429.3.06 Quality Acceptance

General Provisions 101 through 150.

429.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

429.4 Measurement

Rumble strips are measured per each strip constructed.

429.4.01 Limits

General Provisions 101 through 150.

429.5 Payment

Rumble strips will be paid for per each strip completed and accepted. Payment is full compensation for furnishing materials and performing the work.

Payment will be made under:

Item No. 429	Rumble strips	Per each
--------------	---------------	----------

429.5.01 Adjustments

General Provisions 101 through 150.

Section 430—Portland Cement Concrete Pavement

430.1 General Description

This work includes constructing pavement composed of Portland cement concrete, with or without reinforcement as specified, on a prepared subgrade or subbase course.

Follow the requirements of these Specifications and conform to the lines, grades, thicknesses, and cross sections shown on the Plans or by the Engineer.

Report form, furnished by the Engineer
Requests for certification

430.1.03 Submittals

A. Profilograph Equipment and Operator Certification

Include in the Contract Unit Bid Price the cost to furnish and operate a Rainhart (Model 860) Profilograph to measure pavement profile deviations.

Section 430-Portland Cement Concrete Pavement

Before paving, ensure that the operator and the profilograph are certified by the Office of Materials in accordance with Standard Operating Procedure No. 34, Certification of Contractor Personnel and Equipment for Smoothness Testing of Portland Cement Concrete Pavement with the Rainhart Profilograph. Certification includes a mechanical check of the profilograph functions and a written examination by the operator.

Request certification in writing to the Office of Materials at least two weeks before it is needed.

B. Concrete Design

Submit for approval a concrete design that is prepared by a testing laboratory approved by the Office of Materials. The Contractor will transmit the design to the Engineer for approval at least 35 days before use.

C. Approval of Mix Design Proportions

Obtain approval from the Office of Materials for proposed concrete mix designs. Class 1 and 2 concrete mix designs will be verified for early compressive strength according to ASTM C-684, Method A. Class HES concrete mix designs will be verified for compressive strength development at 72 hours according to AASHTO T 126 and AASHTO T 22.

430.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Portland cement	830.2.01
Portland Pozzolan cement	830.2.03
Water	880.2.01
Fine Aggregate, Size No. 10	801.2.02
Coarse Aggregate, Class A or B Crushed Stone or Gravel, Sizes as Specified	800.2.01
Steel Bars for Reinforcement	853.2.01
Steel Wire for Concrete Reinforcement	853.2.06
Welded Steel Wire Fabric for Concrete Reinforcement	853.2.07
Dowel Bars and Bar Coatings	853.2.08
Curing Agents	832
Air Entraining Admixtures	831.2.01
Fly Ash and Slag	831.2.03
Joint Fillers and Sealers	833
Low Modulus Silicone Sealant for Roadway Construction Joints	833.2.06
Epoxy Adhesive for Repairing Cracks	886.2.01
Chemical Admixtures	831.2.02

A. Fly Ash

Use fly ash, if appropriate, as a concrete additive to promote workability and plasticity. It may be used as a partial replacement for Portland cement in concrete, but follow these limits:

1. Do not replace the cement quantity more than 15 percent by weight.
2. Replace cement with fly ash at the rate of 1.25 to 2.0 lbs (1.25 to 2.0 kg) of fly ash to 1 lb (1.0 kg) of cement.
3. Ensure that the fly ash mix conforms to Subsection 430.3.06, "Quality Acceptance."
4. Do not use Type IP cement in fly ash mixes.

B. Granulated Iron Blast-Furnace Slag

If high early strengths are not desired, use granulated slag as a partial replacement for Portland cement in concrete. Follow these limits:

1. Replace the quantity of cement 50 percent or less by weight if the 5-day forecast of the National Weather Service expects temperatures higher than 60 °F (15 °C).
 - a. If the 5-day expected low temperature is less than 60 °F (15 °C) but not less than 40 °F (4 °C), replace the quantity of cement 30 percent or less by weight.
 - b. If the 5-day expected low temperature is less than 40 °F (4 °C), do not use granulated slag.
2. Replace cement with slag at the rate of 1 lb (1 kg) of slag to 1 lb (1 kg) of cement.
3. Ensure that the granulated slag mix conforms to Subsection 430.3.06, "Quality Acceptance."
4. Do not use Type IP cement or fly ash in slag mixes.

C. Composition of Concrete

Design the concrete mix to conform to the following requirements:

1. Coarse Aggregate
Use coarse aggregate size No. 467, 67, or 57 for plain Portland cement concrete pavement.
Use size No. 67 or 57 coarse aggregate for continuous reinforced concrete pavement.
Separate size No. 467 or 456 in individual stockpiles of size No. 4 and size No. 67. Blend according to approved mix proportions.
2. Fine Aggregate
Use fine aggregate that meets the requirements for size No. 10.
When using two sizes or sources of fine aggregate to produce the proper gradation, blend according to the approved design proportions.

D. Protective Materials

Provide materials to protect the concrete edges and surface from rain, including:

- Standard metal forms or wood planks to protect the pavement edges
- Covering material such as burlap or cotton mats, curing paper, or plastic sheeting material to protect the pavement surface

430.2.01 Delivery, Storage, and Handling

Store aggregate from different sources in separate stockpiles.

430.3 Construction Requirements**430.3.01 Personnel****A. Certified Operator**

Before paving, have the Office of Materials, certify a profilograph equipment operator. Certification includes a written examination by the operator.

430.3.02 Equipment**A. Equipment Requirements**

Provide equipment and tools to perform the work. Provide equipment that allows the paver to operate at a constant production rate and rarely start and stop. The Engineer may limit the production rate or batch size if equipment does not keep pace with the other operations or causes poor workmanship.

B. Scales

Before use, the Engineer will inspect and approve the scales to weigh concrete materials and the devices to measure water. Tolerances are ± 1.0 percent throughout the operating range. Measure admixtures to ± 3.0 percent.

C. Paving Equipment

Ensure that equipment operating on the pavement has rubber-tired wheels or flat steel wheels. Wait to operate concrete or shoulder paving equipment on the pavement until the concrete slab is 14 days old or has 2,500 psi (15 MPa) compressive strength.

Paving equipment may be either slip-form or fixed form.

D. Surface Finish Equipment

Use mechanical equipment to produce the surface finish of the mainline and transverse plastic concrete grooving. Ensure that the equipment uses rectangular-shaped steel tines of the same size and uniform length. Use tines with a width between 0.08 in (2 mm) and 0.130 in (3.5 mm). Space the tines approximately 1/2 in (13 mm) apart.

E. Field Laboratory

Provide a field laboratory according to Section 152.

F. Mechanical Sprayers

Provide fully atomizing spraying equipment with a tank agitator to place curing compounds.

430.3.03 Preparation

A. Prepare the Road Bed

Prepare the roadbed as required by the Plans and Specifications before placing concrete pavement.

B. Observe Condition of Subgrade and Subbase

Check the subgrade and subbase as follows:

1. Prepare the full width of the subgrade and subbase according to the Plans and Specifications.
2. Ensure that the surface immediately under the concrete pavement allows proper pavement thickness and yield.
3. Trim high areas to the proper elevation.
4. Ensure that the subbase can support paving equipment without rutting or bogging.

430.3.04 Fabrication

General Provisions 101 through 150.

430.3.05 Construction

A. Mix the Concrete

Produce Portland cement concrete by combining authorized proportions of materials in batches according to the construction methods in this Specification.

Mix the concrete produced in a stationary central mix plant for at least 60 seconds after all materials have entered the drum. Reduce the mix time if representative tests show that the concrete meets requirements of ASTM C 94, Requirements For Uniformity. Never reduce the mix time to less than 50 seconds.

B. Set Forms

Set the forms as follows:

1. Compact the foundation under the forms true to grade. Set the form so that it firmly contacts the foundation for the entire length at the specified grade.
2. Prevent the forms from settling or springing under the finishing machine.
3. Clean and oil the forms before placing the concrete.

C. Dowel Bars

Provide dowel bars at transverse joints unless otherwise noted in the Contract Plans.

D. Place Concrete

After depositing the concrete on the grade, avoid rehandling. Unload and place it as follows:

1. Unload the concrete into an approved spreading device and mechanically spread it on the grade.
2. Place the concrete continuously between transverse joints without using intermediate bulkheads.
3. Hand spread the concrete with shovels, not rakes.

NOTE: Do not allow personnel to walk in freshly mixed concrete with shoes coated with dirt or other materials.

4. Thoroughly consolidate the concrete against the faces of forms and along the full length and sides of joint assemblies.
5. Ensure that vibration does not cause puddling or grout accumulation on the surface.
For construction or expansion joints, do not use grout that accumulates ahead of the paver.
6. Deposit concrete near the formed joints. Dump or discharge concrete only in the center of a joint assembly.
7. Take slab depth measurements as follows:
 - a. Probe the plastic concrete behind the paver.
 - b. Record the station number and depth measurements at least every 500 ft (150 m) at 3 random increments across the slab.
 - c. Provide these measurements to the Engineer when requested.
8. Take air and slump determination tests at a rate of at least three of each test evenly distributed during the workday. Provide the results to the Engineer when requested.
9. Keep reinforcing steel free of dirt, oil, paint, grease, mill scale, and loose or thick rust that could impair the bond of the steel to the concrete.
10. Arrange operations to prevent “leave-outs” in continuous reinforced concrete pavement. The Engineer may approve “leave-outs” in emergencies if a Plan is approved to increase the reinforcement. The Department will not pay for extra leave-outs.

E. Place Reinforcement

Place reinforcement according to the Plans and as follows:

1. Do not insert lane tie bars in unsupported sides of fresh concrete.
2. Ensure that the steel placement method does not damage or disrupt concrete.
3. Use bent lane tie bars if needed in longitudinal formed joints construction. However, replace broken or damaged bars at no additional cost to the Department.

F. Construct the Ramps

Prevent pavement slab stress by constructing a ramp of compacted earth or other material for movement on and off the pavement. Do not allow equipment that exceeds legal load limits on the pavement.

G. Consolidate and Finish

Ensure that the sequence of operations is continuous from placement to final finish.

1. Consolidation

Perform vibration for the full width and depth of the pavement as follows:

- a. Do not allow the vibrators to misalign load transfer devices, or to contact forms or base.
- b. Ensure that the vibrator amplitude is within the range recommended by the manufacturer.
 - Use spud vibrators with an adjustable operating frequency between 8,000 and 12,000 vibrations per minute.
 - Use surface pan vibrators with an adjustable operating frequency between 3,000 and 6,000 vibrations per minute.
- c. If appropriate, use surface vibrators and internal vibrators on concrete greater than 8 in (200 mm) thick.
- d. If appropriate, use surface vibrators exclusively on pavements less than 8 in (200 mm) thick.
- e. Stop vibration when the machine cannot go forward.
- f. Obtain uniform consolidation and density throughout the pavement.

If it is not uniform, stop the operation and provide methods or equipment that will produce pavement that conforms to the Specifications.

2. Finishing

After striking off and consolidating the concrete, follow these steps:

- a. Smooth and true the concrete using a float or finishing machine to minimize or eliminate hand finishing. Perform hand finishing only under the following conditions:
 - Irregular dimension areas where operating mechanical equipment is impractical
 - Mechanical equipment breakdown (only finish the concrete already deposited when the breakdown occurred)
 - Abnormal circumstances approved by the Engineer
- b. Ensure that the pavement surface final finish is true to grade, uniform in appearance, and free of irregular, rough, or porous areas.
- c. Prevent the surface within 6 in (150 mm) of the pavement edge to deviate more than 0.25 in (6 mm) in 10 ft (3 m) when tested with a 10 ft (3 m) straightedge in both transverse and longitudinal directions.
- d. Use mechanical equipment to produce a surface finish of transverse plastic concrete grooving for the mainline and ramps.
- e. Have the Engineer determine the texture depth by conducting pavement surface tests such as GDT 72 at selected locations.
- f. Transversely saw-groove mainline and ramp areas with a surface texture depth less than 0.018 in (0.5 mm). Meet the depth requirement of 0.035 in (0.9 mm) or greater.

Perform saw-grooving to meet the following dimensions:

Width	1/8 in (3 mm)
Depth	3/16 in (5 mm)
Spacing	3/4 in (19 mm) center-to-center

- g. If required, use hand tools to texture ramps, acceleration lanes, and deceleration lanes to surface texture mainline requirements. Finish irregular sections to a surface texture of at least 0.025 in (0.64 mm) as shown in GDT 72.

3. Numbering Stations

Cast station numbers with a die in the pavement every 500 ft (200 m) and 1 ft (300 mm) from the right edge of the travel lane.

4. Protection From Rain

Protect the unhardened concrete from rain. See Subsection 430.2.D, "Protective Materials."

When rain is imminent, stop paving operations and place forms against the sides of the pavement. Cover the surface of the unhardened concrete with the protective covering.

H. Remove Forms

Do not remove forms from freshly placed concrete until it has set for at least 12 hours, unless otherwise provided.

1. Remove forms carefully to avoid damaging the pavement.
2. After removing the forms, immediately cure the sides of the slab using the same method used to cure the pavement surface.
3. Remove and replace major honeycombed areas.

I. Work at Night

Provide adequate lighting for work performed at night. If lighting will not be provided at night, stop the concreting operation in time to finish and saw during daylight hours.

J. Provide Joints

Ensure that joints are designed, configured, and located as shown on the Plans or required by the Specifications.

1. Provide dowel bars at transverse joints unless otherwise noted.
2. Remove and replace plain concrete pavement that cracks during construction with no additional cost to the Department, at the Engineer's discretion.
3. When chipping out random cracks for sealing, use nonrigid epoxy on cracks that are not under expansion-contraction influence and that meet Subsection 886.2.01.
4. Seal continuous cracks that are under movement with sealant that meets Subsection 833.2.06.
5. When removing and replacing a pavement section, remove an area at least 6 ft (1.8 m) long and the full width of the lane.
 - a. Saw to vertical face the sections to be removed and replace the concrete as a construction joint with dowels.
 - b. Use deformed bars as dowels in the saw-cut construction joint. Use the size specified for contraction joints in the Plans.
6. Thoroughly clean the drilled holes of contaminants and set the dowels into the hardened concrete face of the existing pavement with a Type VIII epoxy bonding compound. See Section 886 for epoxy bonding requirements.
7. For contraction joints, use undamaged and properly positioned dowels in existing construction or slab replacement areas. Coat the protruding dowel portions with a thin film of heavy grease.
8. When both sides of an existing construction or contraction joint require slab replacements, replace slabs continuously from saw-cut construction joint to saw-cut construction joint. Use dowels specified for contraction joints.
9. Before placing concrete, uniformly apply a thin coat of heavy grease to epoxy-coated dowels.
10. When placing slabs continuously across transverse contraction joint locations, use saw-cuts to provide planes of weakness according to the requirements of this Specification and the standard drawing for contraction joints.

K. Types of Joints

1. Longitudinal Joints

For longitudinal joints, use unpainted and uncoated deformed steel bars that are the size and length specified on the Plans.

Place the bars perpendicular to the joint using a mechanical device, or rigidly secure the bars in place with supports.

2. Longitudinal Formed Joints

Construct longitudinal formed joints while the concrete is in a plastic state.

Use methods and equipment that locate the joint reinforcement properly without disrupting it during construction.

3. Longitudinal Sawed Joints

Cut longitudinal sawed joints with a mechanical saw within three days after the concrete is placed and before traffic or equipment enters the pavement.

4. Transverse Joints

Transverse joints consist of construction joints, contraction joints, or expansion joints constructed at required locations.

- a. Construct transverse joints in partial width or adjoining lanes to abut the same joint of adjacent lanes unless otherwise specified on the Plans.
- b. Ensure that transverse joints in plain Portland cement concrete requiring load transfer devices contain either plastic-coated or epoxy-coated dowels.
- c. Before placing concrete, secure dowel bars in place with supporting assemblies.
- d. Secure the assemblies in position on the subbase to keep the dowels from moving during concrete placement.
- e. Place dowel bars to a vertical and horizontal tolerance of plus or minus 1 in (25 mm) of the Plan position. Do not misalign the dowel bar more than 3/8 in per 1 ft (10 mm per 300 mm) in the horizontal or the vertical plane.
- f. Remove and replace dowel assemblies displaced from the Plan position more than the tolerances in Subsection 430.3.05.J.
- g. When using epoxy-coated dowels, coat the entire surface with a thin film of heavy waterproof grease.
- h. Ensure accurate positioning of transverse sawed joints by marking the position of dowel bar assembly locations.

5. Construction Joints

Construct transverse construction joints when interrupting concreting operations for more than one hour.

NOTE: Do not construct transverse construction joints within 10 ft (3 m) of an expansion joint, contraction joint, or transverse plane of weakness.

- a. Move an unanticipated construction joint back to the last Plan joint, if necessary. Remove and dispose of excess concrete.
- b. Form construction joints by securing in place a removable bulkhead or header board.
 - 1) Place the board so that it conforms to the full cross section of the pavement. Secure it flush with the subbase and parallel to the normal transverse joints.
 - 2) Slot or drill the board to allow placement of reinforcement as required by the Plans.

NOTE: Do not use the roll of laitance and grout that forms in front of the paver adjacent to transverse construction joints.

- c. Consolidate to full width and depth concrete adjacent to transverse construction joints with mechanical hand-type spud vibrators. Keep one auxiliary vibrator available in case of mechanical malfunctions.
- d. Before applying the final finish to the concrete, stringline and correct variations of the concrete surface within 30 ft (9 m) on either side of the transverse construction joints. Provide equipment and tools such as:
 - Work bridges
 - Personnel
 - String lines
 - Straightedges
 - Lighting
- e. While the concrete is in a plastic condition, stringline the surface longitudinally and correct surface deviations greater than 1/8 in per 15 ft (3 mm per 4.6 m) in any direction.
- f. When using plain Portland cement concrete pavement, place dowel bars in construction joints. Cast half the length of each dowel bar in the concrete during each phase of joint construction.

- g. When using epoxy coated dowels, coat the protruding half of each dowel bar with a thin film of heavy waterproof grease before resuming joint construction. Grease coating is not required on plastic coated dowels.
- h. After the concrete has hardened, dismantle the bulkhead supporting the dowels. Do not disturb the dowels.

6. Contraction Joints

Create planes of weakness in plain Portland cement concrete pavement by cutting joints in the pavement surface. Create the planes according to the Plans as follows:

- a. Saw transverse contraction joints before the pavement cracks. Begin sawing when the concrete has hardened enough to prevent surface raveling, usually 4 hours after placement, but no more than 24 hours.
- b. Continue sawing day and night regardless of weather conditions.

7. Expansion Joints

Transverse expansion joints are required at locations shown on the Plans.

- a. Form expansion joints by securing a removable bulkhead that conforms to the full cross section of the pavement. Use bulkheads that can construct a vertical expansion wall without offsets, indentations, or burrs.
- b. Use expansion joint filler required by the Plans.
- c. Furnish and install preformed joint filler in lengths equal to the pavement width or the width of one lane. Do not use damaged or repaired joint fillers.
- d. Position the expansion joint filler vertically in the joint and at the proper grade. Use an installing bar or other device to secure the expansion joint filler at the proper grade and alignment.

L. Cure the Concrete

Immediately after finishing the concrete, cure the entire surface when the concrete will not mar. Use one or more of these methods:

1. Impervious Membrane Method

To use this method:

- a. Spray the entire surface of the pavement with white pigmented curing compound immediately after finishing the surface and before the concrete has set.
If the pavement is cured initially with cotton mats, burlap, or cotton fabric, apply the compound after removing the mats.

NOTE: Do not apply curing compound during rain.

- b. Use mechanical sprayers to apply curing compound under pressure at a minimum rate of 1 gal per 150 ft² (1 L per 3.5 m²).
- c. Thoroughly mix the compound with uniformly dispersed white pigments.
- d. During application, use a mechanical device to stir the compound continuously.
- e. Use a hand sprayer (if required) to spray odd widths, odd shapes, and concrete surfaces exposed by removing forms.
- f. Do not apply curing compound to the inside faces of joints to be sealed.
- g. If the membrane film becomes damaged within the curing period, repair the damaged portions immediately with additional compound.

2. White Polyethylene Sheeting

To use this method:

- a. Cover the top surface and sides of the pavement with polyethylene sheeting. Lap the units at least 18 in (450 mm).
- b. Place the sheeting and weigh it down so that it contacts the surface.
- c. Extend the sheeting beyond the edges of the slab at least twice the thickness of the pavement.
- d. Unless otherwise specified, maintain the covering in place for 72 hours after placing the concrete.

3. **Burlap, Cotton Fabric, or Other Methods**

Contractors may cure the pavement with burlap, cotton fabrics, or other materials if the section remains wet for the duration specified by the Engineer.

4. **Cold Weather Curing**

To use this method:

- a. Remove and replace concrete that freezes before the initial set time at no cost to the Department.
- b. Use polyethylene or canvas to protect concrete that has set but is exposed to freezing temperatures within 24 hours of placement. Ensure that the internal concrete temperature is above freezing for at least 24 hours after placing the concrete.
- c. Obtain approval from the Engineer to use other protection methods such as hay, straw, or grass, or to change the duration of the protection.

M. Seal the Joints

Clean and seal the joints according to Section 461 and the Plans.

Immediately after completing the curing period, fill in the joints with joint sealing material before opening the pavement to traffic.

During sealing, do not spill the material on the concrete surface. Immediately remove excess material on the concrete surface and clean the surface.

Do not use sand or similar material as a cover for the seal. Seal joints according to the Plans.

N. Open Pavement to Traffic

Wait to open the pavement slab to traffic, except for joint sawing vehicles, until the concrete is 14 days old unless representative compressive tests show that the slab has a compressive strength of 2,500 psi (15 MPa). Cure compressive test specimens used for traffic opening as near as possible to the roadway.

Protect the pavement against traffic from the public, employees, and agents.

1. Erect and maintain barricades. Employ watchmen to block traffic from the newly constructed pavement for the period required in this Specification.
2. Arrange the barriers away from public traffic on lanes remaining open.
3. Maintain signs that clearly indicate the lanes open to public traffic.
4. If traffic must go across the pavement, construct crossings satisfactory to the Engineer to bridge over the concrete. Construct the crossing without additional compensation.
5. Repair or replace pavement damaged by traffic or other causes before Final Acceptance without additional compensation. Make repairs to the Engineer's satisfaction.

430.3.06 Quality Acceptance

The typical section sheet in the Plans gives specific uses for each concrete classification. Refer to this Specification for the minimum requirements of the concrete classifications for concrete design approval, concrete mix design proportions, batching control responsibilities, and acceptance of hardened concrete based upon compressive strength development.

A. Transit Mixed Concrete

Ensure that transit mixed concrete meets the requirements of Subsection 500.2, "Materials."

B. Mix Design Criteria

Proportion concrete mix designs using the following requirements:

Section 430-Portland Cement Concrete Pavement

	Minimum Cement Content per Cubic Yard Concrete (CWT)	Max. Water-Cement Ratio (lbs/lb)	Design Air Content Range (%)
Class 1	5.41	0.53	4.0 to 5.5
Class 2	5.64	0.50	4.0 to 5.5
Class HES	6.58	0.47	4.0 to 5.5

	Minimum Cement Content per Cubic Meter Concrete (kg)	Maximum Water-Cement Ratio (kg/kg)	Design Air Content Range (%)
Class 1	320	0.53	4.0 to 5.5
Class 2	335	0.50	4.0 to 5.5
Class HES	390	0.47	4.0 to 5.5

Produce evidence that the mix design proportions for Class 1 and 2 concrete have strength development potential for 24 hours plus or minus 15 minutes and at 28 days as specified in Subsection 430.3.06.C, [“Approval of Mix Design Proportions.”](#)

C. Approval of Mix Design Proportions

The Department will approve each proposed combination of materials and mix designs based on the use of approved materials, compliance with Subsection 430.3.06.B, [“Mix Design Criteria,”](#) and the following:

1. Flexural Strength

Prepare at least 9 normally cured flexural specimens and test according to AASHTO T 126 and T 97 to ensure that the demonstrated laboratory flexural design strength at 28 days meets the following minimum Design Acceptance Requirement (DAR).

NOTE: Take the 9 flexural specimens from 3 separate trial batches. Make 3 specimens from each batch.

Class No. 1	Concrete DAR = 600 psi + .67 s Concrete DAR = 4.1 MPa + .67 s
Class No. 2	Concrete DAR = 700 psi + .50 s Concrete DAR = 4.8 MPa + .50 s
Class HES	Concrete DAR = 700 psi + .50 s Concrete DAR = 4.8 MPa + .50 s
s = a standard deviation of all 28-day flexural specimens for a given combination of materials and mix proportions prepared together. Do not use a value of “s” greater than 37 psi (255 kPa) to calculate DAR.	

2. Compressive Strength

Prepare and test at least 6 cylinders according to AASHTO T 126 and T 22 to ensure that the demonstrated laboratory compressive strength at 28 days for Class 1 and 2 concrete exceeds the minimum Job Performance Value (JPV).

Produce similar evidence that demonstrates strength development at 72 hours for Class HES concrete.

Class 1	Concrete JPV Minimum = 3,000 psi + .18 R Concrete JPV Minimum = 20 MPa + .18 R
---------	---

Section 430-Portland Cement Concrete Pavement

Class 2	Concrete JPV Minimum = 3,500 psi + .21 R Concrete JPV Minimum = 25 MPa + .21 R
Class HES	Concrete JPV Minimum = 3,000 psi + .05 R Concrete JPV Minimum = 20 MPa + .05 R

R = the difference between the largest observed value and the smallest observed value for all compressive strength specimens at 28 days for a combination of materials and mix proportions prepared together.

a. Class 1 and 2 Concrete

- 1) Submit early compressive strength test results made at 24 hours plus or minus 30 minutes for at least 12 cylinders. Prepare and test according to ASTM C 684, Method A.
- 2) Prepare cylinders from three separate trial batches, and make four specimens from each batch.
- 3) Determine the average strength, standard deviation, and coefficient of variation for the design according to ACI 214. Do not use designs that produce a coefficient variation greater than 10 percent.

b. Class HES Concrete

Submit evidence that designs proposed for use as Class HES concrete have compressive strength development potential at 72 hours of 3,000 psi (20 MPa) plus .05 R.

D. Field Adjustments on Concrete Mixes

Determine the aggregate surface moisture and apply free moisture corrections to the approved mix design. The Engineer will verify that the corrections are made properly.

Adjust the approved proportions of the fine and coarse aggregate and water as desired, provided:

1. The cement factor is not decreased.
2. The water-cement ratio is not increased.
3. Adjustments produce concrete proportions according to this Specification.
4. The Engineer is notified before use.

E. Concrete Mix Tolerances

Keep concrete consistency and air content to vary within the following limits:

1. Consistency

Immediately before placement, use GDT 27 to determine concrete slump. Do not use concrete for Portland cement concrete pavement with a slump value greater than 2.5 in (65 mm).

2. Air Content

Immediately before placement, use GDT 26, GDT 28, or GDT 32 to determine the air content of the concrete.

Concrete will not be accepted that has an air content outside of these limits:

Lower acceptance limit	3.0%
Upper acceptance limit	6.5%

F. Concrete Strength Acceptance

The concrete strength of Portland cement concrete pavement is accepted based upon the compressive strength development at a specific time.

Strength development is determined by a lot acceptance plan. The pavement is subdivided into separate concrete lots of approximately 5,334 yd² (4400 m²) placed continuously, except for required work stoppages.

1. Ramps

Ramps may be set apart as individual lots. Include acceleration or deceleration lanes, wedges, or other varied width sections in other lots if the total paving quantity is not greater than 7,500 yd² (6300 m²). The Engineer will randomly select three production units from each lot for strength determination tests.

2. Class 1 and 2 Concrete
 - a. Cast at least two cylinder sets for each production unit selected for acceptance testing. A set is two 6 by 12 in (150 by 300 mm) cylinders. Cure one set according to ASTM C-684, Method A. Cure the other set according to AASHTO T 23.
 - b. After curing, test each concrete cylinder according to AASHTO T 22. The test result is the average strength of the two cylinders.

3. Acceptance Based on 24-Hour Strength

Concrete may be accepted by early strength determinations. However, concrete will not be accepted based on early strength development when the difference between the largest observed strength value and the smallest observed strength value exceeds 35 percent of the average.

- a. Compute the average (X) and the range (R) from the three acceptance tests results.
- b. Have the Engineer establish the minimum early strength (S) to be used for concrete acceptance.
The minimum early acceptance strength is the average strength at 24 hours plus or minus 30 minutes of the laboratory design less 1.5 times the standard deviation of the laboratory design.
- c. If the average (X) of the three lot acceptance tests equal or exceed the value (S), the lot will be accepted at the full contract price, and 28 day cylinders for this lot can be discarded.
- d. If the average of the three lot acceptance tests fails to meet the acceptance limit, the Engineer will contact the Contractor immediately. The Contractor may immediately remove the concrete in the lot or leave it in place pending acceptance or rejection from the 28-day strength test results.

4. Acceptance Based on 28-Day Strength Tests

When a lot is potentially defective based on the early strength determinations and the Contractor leaves the lot in place to be judged by the 28-day strength tests results, retain and cure all 3 sets of 28-day cylinders.

- a. If the average 28-day strength of the lot does not meet the lower acceptance limit for a 0.70 pay factor, the Engineer may either:
 - Order removal of the concrete in the lot
 - Apply a pay factor of 0.50 for the lot
- b. The Unit Price of concrete pavement will be reduced for areas represented by each lot that does not meet the specified compressive strength at 28 days according to the following schedule:

Pay Factor Schedule for Strength Determinations at 28 Days			
Acceptance Limits for Pay Factor Levels			
	1.00 LAL*	0.95 LAL	0.70 LAL
Concrete Class 1	3,000 psi (20 MPa) + 0.18 R	3,000 psi (20 MPa) - 0.07 R	3,000 psi(20 MPa)- 0.30 R
Concrete Class 2	3,500 psi (25 MPa) + 0.21 R	3,500 psi (25 MPa) - 0.07 R	3,500 psi (25 MPa)-0.30 R
* Lower acceptance limit (LAL)			

5. Classification HES Concrete

Cast at least two sets of cylinders for each production unit selected for acceptance testing.

- a. Cure one set for 72 hours under conditions similar to those under which the pavement is cured. Cure the other set of cylinders for 28 days according to AASHTO T 23.
- b. Test each cylinder according to AASHTO T 22 when the specified curing is complete. The test results are the average strength of the two cylinders.
- c. The Engineer may accept the concrete at full contract price if the average of the three 72-hour test results exceeds the JPV established in Subsection 430.3.06.C.

- d. When the 72-hour strength tests determine that a lot is potentially defective, the Engineer will immediately notify the Contractor. At this time, the Engineer may require the immediate removal of the pavement in question.

If the Engineer does not require immediate removal of the pavement, select removal or acceptance on the basis of the 28-day strength development.

- e. When the 72-hour strength tests determine that a lot is potentially defective and the concrete is retained for subsequent judgment, conduct acceptance tests at 28 days on selected cylinders cured according to AASHTO T 23.

Questionable lots will be accepted based on the 28-day strength and provisions for testing, computations, and payment for Classification No. 2 concrete in Subsection 430.3.06.F.2, "Class 1 and 2 Concrete."

G. Smoothness

Pavement smoothness will be accepted only after the Engineer determines that the work was performed according to this and other Specifications. The completed pavement, including corrective work, must meet the applicable profile index value requirements.

Perform smoothness testing as follows:

1. Ensure that the mainline riding surface produces a profile index value no greater than 7 in/mile (100 mm/km) on each travel lane. Conduct tests according to GDT 78.
2. Determine a profile index value for each tracing for each 0.25 mile (0.5 km) segment. Correct individual bumps or depressions that exceed the blanking band by more than 0.2 in (5 mm) at no additional expense to the Department.
3. If a paving operation exceeds a profile index value of 7 in/mile (100 mm/km) per lane for any segment, suspend the paving operation and take corrective action approved by the Engineer.
4. Use GDT 78 to test ramps and acceleration and deceleration lanes to attain an average profile index value no greater than 12 in/mile (200 mm/km) by Rainhart Profilograph for the entire section length. Correct individual bumps or depressions that exceed 0.2 in (5 mm) from the blanking band at no additional expense to the Department.
5. Take pavement profiles that are 4 ft (1.2 m) away from and parallel to the new pavement edges on pavements greater than 16 ft (4.8 m) wide and up to 24 ft (7.2 m) wide.

Test pavement 6 to 16 ft (1.8 to 4.8 m) wide parallel to and at the center line of the pavement section.

6. Begin the 0.25 mile (0.5 km) record segments at the first day's placement and continue until Project completion, except as noted in this Specification.
7. Combine pavement sections less than 700 ft (200 m) long that approach a bridge. Use the previous 0.25 mile (0.5 km) segment to determine the profile index.
Calculate as a separate record segment 700 ft (200 m) sections or greater that approach a bridge. This exception applies also to sections at Project limits.
8. Determine a separate profile index value using GDT 78 for the 100 ft (30 m) of roadway approaching each end of a bridge up to and including the joint with the approach slab.
Average the profile index from the right and left wheelpaths for each 100 ft (30 m) segment for each lane for each approach. The average profile index value shall not exceed 30 in/mile (500 mm/km).
9. Before paving farther, perform and evaluate profiles from the first day's placement.

- a. After completing and evaluating this test run, adjust equipment as required by the Engineer to improve smoothness before paving continues.
- b. Complete the report form furnished by the Engineer and attach to the profilograph tracings of each day. Include the following information in each trace:
 - Project number
 - Beginning and ending station numbers
 - 500 ft (150 m) paving stations
 - Traffic direction

- Lane number
- Date paved and tested
- Construction joint locations

Have the certified profilograph operator obtain and evaluate the traces and submit the evaluation to the Engineer. Provide results no later than the end of the second work day following placement.

10. For mainline pavement, correct 0.25 mile (0.5 km) segments not meeting the profile index requirement using one of these methods:
 - a. Grind the entire lane surface of the 0.25 mile (0.5 km) segment to a profile index value less than 7 in/mile (100 mm/km). Use equipment that meets requirements in Section 431.
 - b. Grind roughness in small segment areas no more than 50 ft (15 m) of full lane width to produce a profile index value no greater than 7 in/mile (100 mm/km).
If more than 50 ft (15 m) of grinding is required, grind the complete 0.25 mile (0.5 km) segment according to Method a, above.
11. Correct ramps and acceleration and deceleration lanes that do not meet the profile index requirement to a profile index no greater than 12 in/mile (200 mm/km). Prevent individual bumps from exceeding 0.2 in (5 mm) from the blanking band. Use equipment specified in Section 431.
12. Correct 100 ft (30 m) bridge approach sections that do not meet the profile index requirement.
 - a. Grind according to Section 431.
 - b. If appropriate, use a bump grinder to correct bumps with a baseline of 5 ft (1.5 m) or less.
 - c. Grind the full lane width even when grinding including individual bumps.
 - d. Retest pavement segments containing corrective slab replacements for Final Acceptance.
13. Correct segments that do not meet the profile index criteria of this Specification at no additional expense to the Department. Retest segments after correction with the Rainhart Profilograph.
14. Notify the Engineer before profile testing. The Engineer will verify the results by randomly selecting a minimum of 1 out of every 10 consecutive record segment profiles to compute the profile index and to compare with Contractor results.

The Engineer may conduct profilograph tests at any time to verify Contractor results. The Department may test record segments if the Engineer determines that the Contractor test results are inaccurate. See Subsection 430.5.01, “Adjustments.”

H. Thickness

The Engineer shall determine the pavement thickness using average core measurements tested according to GDT 31.

The following table contains units for paving widths:

Paving Widths – Feet (meters)	Length of Unit (Bridges Excluded)—Feet (meters)
0 – 24.0 (0 – 7.2)	1000 (300)
24.1 – 36.0 (7.2 – 10.8)	750 (225)
36.1 – 48.0 (10.8 – 14.4)	500 (150)

Areas of equal depth in intersections, entrances, crossovers, ramps, etc. are considered one unit, and the thickness of each unit is determined separately. If appropriate, include small irregular areas as part of another unit.

1. Take one core for each 2,000 yd² (1675 m²) of pavement, or fraction of pavement, in each unit where the Engineer selects.

The Department will take one core at random in each unit.

- a. When the core measurement is deficient 0.2 in (5 mm) or less from the Plan thickness, full payment is made.
- b. When the measurement is deficient more than 0.2 in (5 mm) and not more than 1 in (25 mm) from the plan thickness, two additional cores are secured from the unit and used to determine the average thickness.

Section 430-Portland Cement Concrete Pavement

- c. A random selection process determines where to secure additional cores. However, do not secure cores within 50 ft (15 m) of other thickness measurement cores. The adjusted Unit Price in Subsection 430.5.01.A, "Concrete Pavement Thickness Deficiency" is used to determine payment for the unit.
2. Consider pavement more than 0.2 in (5 mm) thicker than the specified thickness to be the specified thickness plus 0.2 in (5 mm). Measurements more than 1 in (25 mm) less than the specified thickness are not included in the average.
3. When the core measurement is at least 1 in (25 mm) less than the specified thickness:
 - a. Determine the pavement thickness in the affected location by taking additional cores at no less than 10 ft (3 m) intervals parallel to the center line in each direction.
 - b. Continue until a core is found that is not deficient by more than 1 in (25 mm).
 - c. Have the Engineer evaluate areas more than 1 in (25 mm) deficient in thickness. Remove deficient areas and replace with concrete pavement of the thickness shown on the Plans, if the Engineer requires.Exploratory cores for deficient thickness are not used in averages for adjusted Unit Price.

430.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

430.4 Measurement

The area that will be paid for under this Item is the number of square yards (meters) of concrete pavement accepted as measured complete in place. The pavement width measured is shown on the typical cross section of the Plans, including additional widening as required or widening directed in writing by the Engineer.

The length is measured along the pavement surface.

Work is accepted lot-to-lot according to Section 106 and this Specification.

430.4.01 Limits

General Provisions 101 through 150.

430.5 Payment

Concrete pavement completed and accepted that meets the Specification requirements will be paid for at the full Contract Unit Price per square yard (meter).

Payment for other accepted concrete pavement will be based on an adjusted Unit Price per square yard (meter). This price will be adjusted for payment for concrete pavement accepted but deficient in depth or compressive strength at 28 days. Price adjustments are specified in Subsection 430.5.01, "Adjustments."

No additional payment over the Contract Unit Price will be made for pavement units with an average thickness greater than on the Plans. No additional payment over the Contract Unit Price will be made for a lot of concrete that develops more strength at 28 days than the compressive strength established in Subsection 430.3.06.F, "Concrete Strength Acceptance."

Payment is full compensation for furnishing and placing materials, reinforcements, dowel and joint materials, supplies, and incidentals to complete the work.

Payment will be made under:

Item No. 430	Plain Portland cement concrete pavement, class no. 1 concrete _____ in (mm) thick	Per square yard (meter)
Item No. 430	Plain Portland cement concrete pavement class no. 2 concrete _____ in (mm) thick	Per square yard (meter)
Item No. 430	Plain Portland cement concrete pavement, class HES concrete _____ in (mm) thick	Per square yard (meter)
Item No. 430	Continuously reinforced concrete pavement, class no. 1 concrete _____ in (mm) thick	Per square yard (meter)

Section 430-Portland Cement Concrete Pavement

Item No. 430	Continuously reinforced concrete pavement, class no. 2 concrete _____ in (mm) thick	Per square yard (meter)
Item No. 430	Continuously reinforced concrete pavement, class HES concrete _____ in (mm) thick	Per square yard (meter)

430.5.01 Adjustments

The Contract Unit Price per square yard (meter) of concrete pavement will be adjusted for concrete pavement accepted but deficient in thickness or compressive strength at 28 days. Adjusted Unit Prices per square yard (meter) of concrete pavement are based on one or both of the following conditions:

A. Concrete Pavement Thickness Deficiency

1. If the core is deficient 0.2 in (5 mm) or less from the Plan thickness, full payment will be made. If the core is deficient in thickness more than 0.2 in (5 mm), but not more than 1 in (25 mm) from the Plan thickness, 2 additional cores will be taken from the area.
 - a. If the average measurement of these 3 cores is deficient 0.2 in (5 mm) or less from the Plan thickness, full payment will be made.
 - b. Where the average pavement thickness is deficient by more than 0.2 in (5 mm), but not more than 1 in (25 mm), payment will be made at a portion of the Unit Price per square yard (meter) of concrete pavement as shown in the following table:

Concrete Pavement Deficiency	
Deficiency in Thickness Determined by Cores-- in (mm)	Proportional Part of Contract Price Allowed
0.0 through 0.20 (0.0 through 5.0)	100 percent
0.21 through 0.25 (5.1 through 6.4)	95 percent
0.26 through 0.30 (6.5 through 7.6)	91 percent
0.31-0.40 (7.7 through 10.0)	86 percent
0.41-0.50 (10.1 through 12.8)	80 percent
0.51-0.75 (12.9 through 19.2)	70 percent
0.76-1.00 (19.3 through 25.0)	60 percent

- c. When the thickness of pavement is deficient by more than 1 in (25 mm) and the Engineer determines that the deficient area should not be removed or replaced, 50 percent of the Contract Unit Price will be paid.
2. No payment or compensation for cost will be made for removing concrete according to this provision.

B. Compressive Strength Deficiency

When the compressive strength at 28 days, expressed as an average strength (X) for a lot of concrete pavement is less than the values established by the Pay Factor Table, payment will be made at a reduced Unit Price per square yard (meter) as shown in the Pay Factor Table.

C. Combined Deficiencies

When a pavement section is deficient in thickness and compressive strength, the Contract Unit Price will be adjusted by the total reduction from applying the percentages in Subsections 430.5.01.A and Subsection 430.5.01.B, above.

For combined deficiencies of 50 percent or more, the Engineer may leave the pavement in place at the combined payment reduction or order the deficient areas removed and replaced at no additional cost to the Department.

If the Engineer orders removal of the pavement, payment will not be made for the original pavement or removal. Pavement replaced will be paid for at the appropriate Unit Price.

D. Profilograph Testing

If, based on the Department's profilograph tests, the Engineer determines that the Contractor profilograph test results are inaccurate, the Contractor will be charged for profilograph testing at \$500 for each trace mile (\$250 for each trace kilometer), with a minimum charge of \$500.

Section 431—Grind Concrete Pavement

431.1 General Description

This work includes grinding existing Portland cement concrete pavement to eliminate joint faulting or to restore proper drainage and riding characteristics to the pavement surface. Perform the work according to these Specifications and the Plans.

431.1.01 Definitions

General Provisions 101 through 150.

431.1.02 Related References

A. Standard Specifications

General Provisions 101 through 150.

431.3 Construction Requirements

431.3.01 Personnel

General Provisions 101 through 150.

431.3.02 Equipment

A. Grinding Equipment

Use power driven, self-propelled grinding equipment with these characteristics:

- Diamond blades designed to smooth and texture Portland Cement concrete pavement
- Effective wheel base of at least 12 ft (3.6 m)
- Pivoting tandem bogey wheels at the front of the machine
- Rear wheels arranged to travel in the track of the freshly cut pavement
- Grinding head with the center no further than 3 ft (900 mm) forward from the center of the back wheels

Ensure that the equipment:

- Cuts or planes at least 3 ft (900 mm) wide
- Operates without encroaching on traffic movement outside the work area
- Grinds the surface without causing spalls at cracks, joints, or other locations

Periodically check the equipment to ensure that it is in proper working order, especially the wheel “roundness” on the grinding equipment. Immediately correct “out-of-round” wheels.

B. Rainhart Profilograph

Use the Rainhart Profilograph to test ground pavement surfaces on ramps, acceleration and deceleration lanes, and other areas not suitable for testing with the Road Profiler for Pavement Profile Index value.

431.3.03 Preparation

Complete spall repairs, slab replacements, and pressure grouting in the area to be ground before beginning grinding operations.

431.3.04 Fabrication

General Provisions 101 through 150.

431.3.05 Construction

Grind the pavement surface areas designated on the Plans. Only grind bridge decks and roadway shoulders when they are indicated on the Plans, required to promote drainage, or required to conform to smoothness requirements if the work is new construction or bridge decks.

Grind the surface areas as follows:

1. Schedule the construction operation to produce a uniform finished surface.
2. Maintain a constant cross slope between grinding extremities in each lane to ensure that grinding provides positive lateral drainage.
3. Transition auxiliary or ramp lane grinding from the mainline edge and at the end of the cut to provide positive drainage and acceptable riding surface.
4. Grind the entire area designated on the Plans until the pavement surfaces of the adjacent sides of transverse joints and cracks are in the same plane.
5. Eliminate the faulting at joints and cracks, and ensure that the overall riding characteristics are within the limits specified.
6. Texture the pavement surface, but do not grind extra depth to eliminate minor depressions.
7. Remove grinding residue before it is blown by traffic action or wind. Do not allow residue to flow into gutters, drainage facilities, or across lanes used by public traffic.
8. Ensure that the operation produces pavement that conforms to the typical cross section and requirements in Subsection 431.3.06, “Quality Acceptance.”

431.3.06 Quality Acceptance

Produce a pavement surface that is true to grade and uniform with a longitudinal line-type texture.

A. Texture

Ensure that the line-type texture contains corrugations that are parallel to the outside pavement edge and have a narrow ridge corduroy-type appearance.

B. Grooves

Ensure that the peaks of the ridges are 1/16 in, \pm 1/32 in (1.6 mm, \pm 0.8 mm) higher than the bottoms of the grooves with 57 to 60 (185 to 200) evenly spaced grooves per foot (meter). Select the number of grooves per foot (meter) to produce the surface finish for each aggregate type that is in the concrete surface on the project. Groove spacing that does not meet the specified surface finish will not be accepted.

C. Finished Pavement Surface

Correct deficiencies in the final surface finish from improper operation or equipment at no expense to the Department. This includes, but is not limited to:

- Pavement corrugation due to “out of round” wheels on grinding equipment
- Improper cutting head operations that cause the head to ride in and out of the pavement when encountering light and heavy cuts
- Depressions created from improper starting and stopping during the cutting operation
- Unground ridges left in the pavement from defective blades in the grinding head

Closely check the ground pavement surface during grinding, and take corrective action if any of the above deficiencies occur. The finished pavement surface will be measured for riding quality using the Laser Road Profiler according to test procedure GDT 126.

Follow these requirements to ensure that the grinding produces an acceptable riding surface:

1. Ensure that the ground pavement surfaces on the mainline meet a pavement ride index value not exceeding 900 on each 0.25 mile segment (0.5 km segment) for each vehicle lane.
2. Conduct tests according to GDT 126. Calculate and report smoothness values for each 0.25 mile (0.5 km) section of each vehicle lane.
3. Regrind areas that do not meet the smoothness requirements at no additional cost to the Department.

D. Regrinding

To regrind areas to meet the smoothness or final surface finish:

1. Regrind the entire lane width in the area to be corrected. Regrind of just a portion of the lane width will not be permitted
2. Perform spot regrinding on moderate to major deviations throughout the deficient 0.25 mile (0.5 km) section of the lane to meet the smoothness and final surface finish requirements. Spot regrinding of just the largest deviations of a portion of the deficient 0.25 mile (0.5 km) lane section will not be permitted.

The Engineer may require profilograph traces before regrinding to locate deviations within a failed area. The Department will perform profilograph testing according to GDT 78. Provide traffic control for profilograph testing at no cost to the Department.

The Engineer may require profilograph testing of ground surfaces on the mainline that meet the smoothness requirements. Testing will be performed according to GDT 78 to isolate locations with individual bumps or depressions greater than 0.20 in (5 mm) outside the blanking band. Perform corrective grinding to eliminate these bumps or depressions at no additional cost to the Department.

Ensure that the Pavement Profile Index value readings on ramps, acceleration and deceleration lanes, and other areas not suitable for Road Profiler testing do not exceed 7 in/mile (100 mm/km) when tested in accordance with GDT 78. If they are exceeded:

- Regrind the areas that exceed this value at no additional cost to the Department.
- Regrind individual bumps or depressions greater than 0.20 in (5 mm) outside the blanking band on the profilograph trace at no additional cost to the Department.

Inspect transverse joints and random cracks to ensure that adjacent surfaces are in the same plane. Grind surface misalignments greater than 1/16 in (2 mm) of the surface planes on adjacent sides of the joints or cracks until the surfaces are flush.

E. Pavement Transverse Slope

Ensure that the pavement transverse slope is uniform and that depressions or slope misalignments are not greater than 1/8 in. in 12 ft (3 mm in 3.6 m) when tested with a straightedge placed perpendicular to the centerline.

1. Minimize vertical alignment mismatches between adjacent cuts, 1/16 in (2 mm) maximum.

2. Check the transverse slope closely as the work progresses. Correct mismatches immediately.
3. If one or more lanes are not to be ground, ensure that the vertical interface edge between the ground and unground lanes is not misaligned more than 1/8 in. (3 mm).

Feather the cut from the ground lanes into the unground lanes to meet this requirement.

431.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

431.4 Measurement

Pavement grinding on existing pavements is measured by the square yard (meter). Determine the quantity of pavement grinding by multiplying the finished ground width by the total length ground.

431.4.01 Limits

General Provisions 101 through 150.

431.5 Payment

The Contract Price per square yard (meter) for grinding concrete pavement is full compensation for furnishing labor, materials, tools, equipment, and incidentals grinding the existing surface, removing residue, and cleaning the pavement according to these Specifications and as shown on the Plans.

Payment will be made under:

Item No. 431	Grind concrete pavement	Per square yard (meter)
--------------	-------------------------	-------------------------

431.5.01 Adjustments

General Provisions 101 through 150.

Section 432—Mill Asphaltic Concrete Pavement

432.1 General Description

This work includes milling existing asphaltic concrete pavement to restore proper grade and/or transverse slope, removing structurally unsound material, providing clearance for overlay in curb and gutter sections, or other purposes deemed necessary due to existing conditions. Perform the work according to these Specifications and Plan details.

432.1.01 Definitions

General Provisions 101 through 150.

432.1.02 Related References

A. Standard Specifications

Section 109—Measurement and Payment

B. Referenced Documents

GDT 126

432.1.03 Submittals

General Provisions 101 through 150.

432.2 Materials

432.2.01 Delivery, Storage, and Handling

When specified, stockpile the milled material at locations shown on the Plans.

1. Uniformly stockpile the materials approximately 6 – 8 ft (1.8 – 2.4 m) high.
2. Maintain the existing drainage pattern of water from the stockpile storage area.
3. Dress the reclaimed asphalt area to drain rainwater from the material.
4. Obtain the Engineer's approval of the stockpile locations and the method used to prevent milled material degradation, segregation, and reconsolidation.

432.3 Construction Requirements

432.3.01 Personnel

General Provisions 101 through 150.

432.3.02 Equipment

A. Milling Equipment

Use power-driven, self-propelled milling equipment that is the size and shape that allows traffic to pass safely through areas adjacent to the work. Also, use equipment that is:

- Designed to mill and remove a specified depth of existing asphalt paving
- Equipped with grade and slope controls operating from a stringline or ski and based on mechanical or sonic operation
- Capable of removing pavement to an accuracy of 1/8 in (3 mm)
- Furnished with a lighting system for night work, as necessary
- Provided with conveyors capable of side, rear, or front loading to transfer the milled material from the roadway to a truck

B. Dust Control

Provide power brooms, vacuum sweepers, power blowers, or other means to remove loose debris or dust. Do not allow dust control to restrict visibility of passing traffic or to disrupt adjacent property owners.

432.3.03 Preparation

General Provisions 101 through 150.

432.3.04 Fabrication

General Provisions 101 through 150.

432.3.05 Construction

A. Milling Operation

Follow the Plans to mill the designated areas and depths including bridge decks, shoulders, and ramps, as required. Ensure the following requirements are met:

1. Schedule the construction operation. Use milling methods that will produce a uniform finished surface and maintain a constant cross slope between extremities in each lane.
2. Provide positive drainage to prevent water accumulation on the milled pavement, as shown on the Plans or directed by the Engineer.

3. Bevel back the longitudinal vertical edges greater than 2 in (50 mm) that are produced by the removal process and left exposed to traffic. Bevel them back at least 3 in for each 2 in (75 mm for each 50 mm) of material removed. Use an attached mold board or other approved method.
4. When removing material at ramp areas and ends of milled sections, taper the transverse edges 10 ft (3 m) to avoid creating a traffic hazard and to produce a smooth surface.
5. Protect with a temporary asphaltic concrete tie-in (paper joint) vertical edges at other areas such as bridge approach slabs, drainage structures, and utility apputenance greater than 1/2 in that are left open to transversing vehicles. Place the temporary tie-in at taper rate of at least 6 to 1 horizontal to vertical distance.
6. Remove dust, residue, and loose milled material from the milled surface. Do not allow traffic on the milled surface and do not place asphaltic concrete on the milled surface until removal is complete.

The reclaimed asphaltic pavement becomes the Contractor's property unless otherwise specified.

432.3.06 Quality Acceptance

Ensure that the milling operation produces a uniform pavement texture that is true to line, grade, and cross section.

Milled pavement surface acceptance testing will be performed using the Laser Road Profiler method in GDT 126. Milled pavement will be evaluated on individual test sections, normally 1 mile (1 km) long.

When the milled surface is to be left as the final wearing surface, ensure that indices do not exceed:

- 1025 on milled pavement surfaces on interstates when the milled surface will be the final wearing surface
- 1175 for other on-system routes when the milled surface will be the final wearing surface
- 1175 on Interstates and 1325 for other on-system routes if the milled surface will be overlaid

Remill mile (kilometer) areas to meet the specified limits when the indices are exceeded. Remill at no additional cost to the Department.

Milled pavement surfaces are subject to visual and straightedge inspection. Keep a 10 ft (3 m) straightedge near the milling operation to measure surface irregularities of the milled pavement surface. Remill irregularities greater than 1/8 in per 10 ft (3 mm in 3 m) at no additional cost to the Department.

Ensure that the cross slope is uniform and that no depressions or slope misalignments greater than 1/4 in per 12 ft (6 mm in 3.6 m) exist when the slope is tested with a straightedge placed perpendicular to the center line.

432.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

432.4 Measurement

Milling existing asphaltic concrete pavement is measured by the square yard (meter) as described in Subsection 109.01, "Measurement and Quantities."

432.4.01 Limits

General Provisions 101 through 150.

432.5 Payment

Milling asphaltic concrete pavement, measured as specified, will be paid for at the Contract Unit Price bid per square yard (meter). The price bid for this item includes the credit value of all Reclaimed Asphalt Pavement (RAP) recovered, and no adjustment in the unit price for this item or other items will be considered for variations in the amount of RAP actually recovered.

Payment is full compensation for furnishing equipment, milling, hauling, stockpiling milled material, and satisfactorily performing the work.

Payment will be made under:

Item No. 432	Mill asphaltic concrete pavement, ___ in (mm) depth	Per square yard (meter)
Item No. 432	Mill asphaltic concrete pavement, variable depth	Per square yard (meter)

432.5.01 Adjustments

General Provisions 101 through 150.

Section 433—Reinforced Concrete Approach Slabs

433.1 General Description

This work includes building reinforced concrete approach slabs for bridges on completed and accepted subgrades.

433.2 Materials

Ensure that materials meet these requirements:

A. Concrete

- Use concrete specified as Class A concrete (see Section 500) or pavement concrete (see Section 430).

B. Steel Bars for Concrete Reinforcement

- See Subsection 853.2.01.

C. Forms

- Use steel or wood forms that meet the requirements of Section 430 or Section 500.

D. Concrete and Reinforcement Steel

Ensure that concrete for approach slabs is proportioned, mixed, placed, and cured according to Section 430 or that it meets the requirements for Class A concrete (Section 500).

Place reinforcement steel according to Section 511.

433.3.02 Equipment

General Provisions 101 through 150.

433.3.03 Preparation

General Provisions 101 through 150.

433.3.04 Fabrication

General Provisions 101 through 150.

433.3.05 Construction

Construct the approach slab before placing the adjacent roadway paving, unless otherwise specified in the Plans.

A. Approach Slabs

Finish, cure, and protect the approach slabs as specified in Subsection 500.3.05.Q, "Place Concrete" and Subsection 500.3.05.Z.3, "Bridge Deck Curing."

B. Curbs

Construct curbs of the dimensions required monolithic with the approach slab, when specified on the Plans. Place, finish, and cure the curb as specified in Section 441.

C. Barriers

Construct and finish the barriers according to Section 500, Section 621 and Plan details. Use concrete that is Class A or better and proportioned and mixed according to Section 500.

D. Final Finish

When the concrete has hardened and standing water and moisture sheen have disappeared, give the concrete a final finish, manually or mechanically, according to requirements in Section 500 for bridge decks.

433.3.06 Quality Acceptance

The riding quality of approach slabs will be tested with the Lightweight Profiler as part of the bridge deck according to Subsection 500.3.06.E, "Ride Quality Test".

433.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

433.4 Measurement

The quantity for payment for reinforced concrete approach slabs is the number of square yards (meters) complete in place and accepted. The pay area is computed by the overall length and width of the approach slabs as shown on the Plans, with no deductions for areas with end posts and expansion joints.

433.4.01 Limits

Curbs, barriers, and reinforcing steel are not measured for payment, but their cost is included in the price bid for the individual Contract item.

433.5 Payment

The area measured will be paid for at the Contract Unit Price per square yard (meter).

Payment will be made under:

Item No. 433	Reinforced concrete approach slab	Per square yard (meter)
Item No. 433	Reinforced concrete approach slab, including curb	Per square yard (meter)
Item No. 433	Reinforced concrete approach slab, including barrier	Per square yard (meter)
Item No. 433	Reinforced concrete approach slab, including sloped edge	Per square yard (meter)

433.5.01 Adjustments

General Provisions 101 through 150.

Section 434—Asphalt Paved Ditches

434.1 General Description

This work includes paving ditches, spillways, and other similar waterways with hot asphalt mixture.

434.1.01 Definitions

General Provisions 101 through 150.

434.1.02 Related References

A. Standard Specifications

B. Referenced Documents

GDT 7

GDT 66

GDT 115

434.1.03 Submittals

General Provisions 101 through 150.

434.2 Materials

Ensure that materials meet the requirements of Section 802, Section 820, and Section 828.

434.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

434.3 Construction Requirements

434.3.01 Personnel

General Provisions 101 through 150.

434.3.02 Equipment

Use equipment that meets the requirements in Section 400 for mixing and transporting the asphaltic concrete.

A. Hand-Operated Roller

Use a hand-operated roller that weighs at least 300 lbs (135 kg).

B. Small Power Roller

Use a small power roller satisfactory to the Engineer.

C. Vibratory Device

Use a vibratory device satisfactory to the Engineer.

D. Hand Tampers

Use hand tampers to compact areas that cannot be reached with rollers or vibrators.

E. Forms

Use forms that are satisfactory to the Engineer, if required.

434.3.03 Preparation

General Provisions 101 through 150.

434.3.04 Fabrication

General Provisions 101 through 150.

434.3.05 Construction

Use ditch paving construction methods that allow water to flow continuously and that keep the ditch unobstructed to prevent ponding or standing water. Protect the ditch paving areas under construction from flowing water, elements, and other disturbances until the materials are fully set.

A. Develop the Asphalt Mixture

Use a uniform, homogeneous asphalt mixture of aggregate and bituminous material. A job mix formula is not required; however, base the mixture on an approved design analysis that meets the requirements of either a 4.75 mm mixture or 9.5 mm Superpave mixture (Level A) as described in Section 828 except that testing for moisture susceptibility, GDT 66 and rutting susceptibility, GDT 115, will not be required. The asphalt content for ditch paving shall be set 1.0% higher than the optimum asphalt content determined during the mix design analysis. Control the mixture within the mixture control tolerances for the respective mix given in Section 828. Do not continue operation outside the mixture control tolerances.

B. Form the Subgrade

Form the subgrade as follows:

1. Form the subgrade at the required depth below and parallel to the finished surface of the ditch or waterway required by the Plans.
2. Remove soft, yielding, or otherwise unsuitable material and substitute with suitable material.
3. Compact the subgrade to 90 percent of the maximum dry density as determined by GDT 7. Finish to a smooth, firm surface.
4. If shown on the Plans, place and compact the subgrade material to the required thickness.

C. Stake the Forms

If forms are required, stake them securely into position at the correct line and elevation.

D. Place the Asphalt Mixture

Place the mixture on the prepared subgrade only when the subgrade is properly prepared and weather conditions are suitable. Place as follows:

1. Place the mixture within the temperature limits of 275 ° to 325 °F (135 ° to 160 °C).
2. Smooth the mixture by raking or screeding.
3. Thoroughly compact the mixture as follows:
 - a. Roll with a hand-operated roller, small power roller, or vibratory device satisfactory to the Engineer.
 - b. Use hand tampers to compact areas that cannot be reached with rollers or vibrators.
 - c. Compact until the surface is smooth and even and the texture is dense and uniform. The thickness, lines, grades, and cross section shall be as shown on the Plans.
4. Remove forms, if used, and replace with compacted backfill. Shape the shoulders and slopes and complete them to conform to the required section.

434.3.06 Quality Acceptance

General Provisions 101 through 150.

434.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

434.4 Measurement

A. Asphalt Ditch Paving

Asphalt for ditch paving is measured in tons (megagrams) as mixed, placed, and accepted. The actual weight is determined by using an approved motor truck scale to weigh each loaded vehicle as the material is hauled to the roadway. The weight measured includes all materials.

B. Incidental Items

Incidental items such as preparing the subgrade and excavating unsuitable material and backfill are not measured for separate payment, unless otherwise specified. Those costs are included in the Unit Price Bid.

434.4.01 Limits

General Provisions 101 through 150.

434.5 Payment

A. Asphalt Ditch Paving

Asphalt for ditch paving will be paid for at the Contract Unit Price per ton (megagram) complete in place and accepted. Payment is full compensation for furnishing materials, bituminous material, and equipment and for preparing the subgrade, hauling, stockpiling, mixing, spreading, and rolling.

B. Incidental Items

Unless otherwise specified, no separate payment will be made for incidental items.

Payment will be made under:

Item No. 434	Asphalt ditch paving mixture	Per ton (megagram)
--------------	------------------------------	--------------------

434.5.01 Adjustments

General Provisions 101 through 150.

Section 435—Rapid Setting Cement Concrete End Dams and Patches

435.1 General Description

This work includes constructing bridge joint end dams and partial or full depth patches in concrete structures. Use rapid-setting cement concrete under these conditions:

- Quick traffic return is required.
- The required minimum depth is 1 in. (25 mm)

435.1.01 Definitions

General Provisions 101 through 150.

435.1.02 Related References

A. Standard Specifications

- Section 461—Sealing Roadway and Bridge Joints and Cracks

- Section 504—Twenty-Four Hour Accelerated Strength Concrete
- Section 833—Joint Fillers and Sealers
- Section 886—Epoxy Resin Adhesives
- Section 934—Rapid Setting Patching Materials for Portland Cement Concrete

B. Referenced Documents

General Provisions 101 through 150.

435.1.03 Submittals

A. Mix Design

Submit rapid-setting cement concrete mix designs and materials to the Office of Materials for verification and approval at least 35 days before use.

435.2 Materials

Use these materials to construct bridge joint end dams or repair concrete:

Section 435-Rapid Setting Cement Concrete End Dams and Patches

Material	Section
Rapid-setting Cement Material	934
Epoxy Adhesive, Type II	886
Silicone Sealant	461.3.05.C.2 and 833.2.06
Preformed Foam Joint Filler	833.2.10

435.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

435.3 Construction Requirements

435.3.01 Personnel

General Provisions 101 through 150.

435.3.02 Equipment

General Provisions 101 through 150.

435.3.03 Preparation

Prepare the surfaces for construction as follows:

1. Scarify the surface within the repair area using a concrete scabbler to remove unsound concrete and concrete laitance down to sound coarse aggregate.
2. After scarifying the surface, sandblast it to remove loose or unsound concrete or other contaminates.
3. Clean the prepared area with compressed air.
4. Completely coat the bottom and vertical side walls of the prepared area with a film of Type II epoxy approximately 10 to 20 mils (0.25 to 0.50 mm) thick.

435.3.04 Fabrication

General Provisions 101 through 150.

435.3.05 Construction

Repair the bridge joint end dams in the locations or areas indicated on the Plans or as designated by the Engineer.

Remove asphaltic concrete from the end dams areas according to Figure 1 (Figure 1 metric).

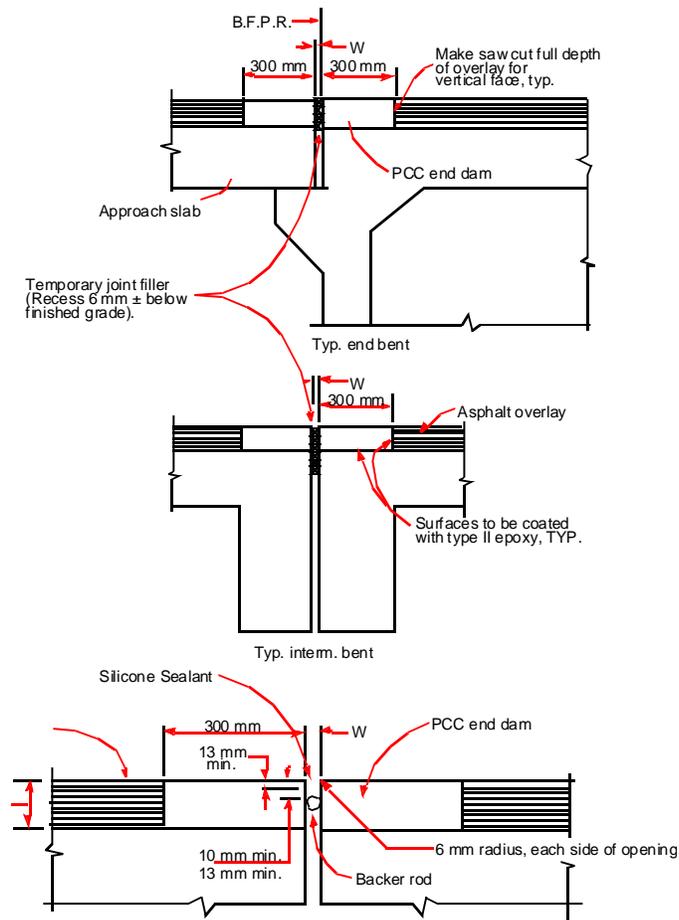

Figure 1 (metric)

A. Weather Limitations

Place rapid-setting cement concrete within the temperature range of 40 °F to 100 °F (4 °C to 38 °C). Do not apply epoxy bonding adhesive to a damp substrate.

B. Mix Design

Do not use aggregate that is larger than one-quarter the depth of the repair.

C. General Instructions

Handle, mix, place, and finish rapid-setting cement concrete according to the manufacturer's instructions. Ensure that the finished rapid-setting cement concrete surface is the same elevation and cross slope as the adjacent pavement.

D. Placement

Place the rapid-setting cement concrete as follows:

1. Deposit it in the area while the epoxy is still tacky.
2. Vibrate it to completely fill the area of the end dam or patch.

3. Finish the concrete to the proper grade; do not disturb it until the watersheen disappears from the surface.

E. Curing

Cure the rapid-setting cement concrete according to Subsection 500.3.05.Z “Cure Concrete,” and as follows:

1. Cure it long enough to develop the concrete strength in place as required in Subsection 435.3.05.G, “Compressive Strength.”
2. Use the compressive strength test procedures in Subsection 504.3.06.A, “Compressive Strength Testing,” except the Laboratory may reduce the number of test cylinders.

F. Joint Reestablishment

Reestablish the joint as follows:

1. Place temporary joint material that conforms to Subsection 833.2.10 in the joint so to place and screed the full width of the end dams or patches and to bridge the temporary joint material with the screeding apparatus.
2. If patching a joint, reestablish the joint opening to match the existing joint; if constructing an end dam, match the Plan details.
3. Remove the temporary joint material. Sandblast the vertical faces of the joint opening to remove loose material and to produce a coarse texture conducive to bonding sealant.
4. Immediately after sandblasting, seal the opening according to Figure 1 (metric) and Subsection 461.3.05.C.2.

G. Compressive Strength

Do not allow traffic on end dams or patches until the rapid-setting cement concrete obtains a minimum compressive strength of 2,500 psi (15 MPa).

435.3.06 Quality Acceptance

A. Correction of Defects

Remove and replace, at the Contractor’s expense, completed end dams or patches that contain cracks, are disbonded from asphalt or slab, or are damaged from construction or traffic before Final Acceptance.

Replace, at the Contractor’s expense, silicone joint sealant that fails or that is not within the depth tolerances of Figure 1 (Figure 1 metric).

435.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

435.4 Measurement

The area measured for payment is the rapid-setting cement concrete in cubic feet (meters) used in bridge joint end dams or patches completed in place and accepted.

435.4.01 Limits

General Provisions 101 through 150.

435.5 Payment

The joints measured will be paid for at the Contract Unit Price per cubic foot (meter) for bridge joint and end dams, and per cubic foot (meter) for patches. Payment is full compensation for:

- Sawing as required
- Removing the asphaltic concrete material or spalled, broken, or damaged Portland Cement Concrete
- Cleaning the substrate by sandblasting or abrading and planing
- Mixing, placing, finishing, and curing the concrete

Section 435-Rapid Setting Cement Concrete End Dams and Patches

- Providing equipment, tools, and labor
- Performing incidentals to complete the work, including sealing the joints

Payment will be made under:

Item No. 435	Rapid-setting cement concrete bridge joint end dams	Per cubic foot (meter)
Item No. 435	Rapid-setting cement concrete patching Portland cement concrete	Per cubic foot (meter)

435.5.01 Adjustments

General Provisions 101 through 150.

Section 436—Asphaltic Concrete Curb

436.1 General Description

This work includes constructing asphaltic concrete curbs according to these Specifications. Construct curb that conforms to the lines and grades shown on the Plans or established by the Engineer.

436.1.01 Definitions

General Provisions 101 through 150.

436.1.02 Related References

A. Standard Specifications

B. Referenced Documents

GDT 7

GDT 66

GDT 115

436.1.03 Submittals

General Provisions 101 through 150.

436.2 Materials

Ensure that materials meet the requirements of Section 802, Section 820, and Section 828.

Use a uniform, homogeneous asphalt mixture of aggregate and bituminous material. A job mix formula is not required; however, base the mixture on an approved design analysis that meets the requirements of either a 4.75 mm mixture or 9.5 mm Superpave mixture (Level A) as described in Section 828 except that testing for moisture susceptibility, GDT 66 and rutting susceptibility, GDT 115, will not be required. The asphalt content for asphaltic concrete curb shall be set 1.0% higher than the optimum asphalt content determined during the mix design analysis. Control the mixture within the mixture control tolerances for the respective mix given in Section 828. Do not continue operation outside the mixture control tolerances.

436.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

436.3 Construction Requirements

436.3.01 Personnel

General Provisions 101 through 150.

436.3.02 Equipment

Use equipment that meets the requirements in Section 400 for mixing and transporting the asphaltic concrete.

A. Self-Propelled Curbing Machine

For curb construction, use an approved self-propelled curbing machine equipped with:

- A hopper
- A power-driven screw or other device that forces the mixture through a tube and then through a die attached to the tube

Design the mold to produce the desired cross section of the curb. Ensure that the curbing machine can:

- Thrust against the asphalt mixture to eliminate objectionable surface voids as the mixture passes through the mold
- Produce curbing with a uniform texture, shape, and density

Use hand methods adjacent to structures.

436.3.03 Preparation

Prepare the curb foundation as follows:

1. Excavate subgrades for header type curbs to the required depth.
2. Remove and replace soft or unstable material with stable material.
3. Compact and finish the subgrade to 90 percent of the maximum density as determined by GDT 7.
4. Shape the subgrade to the required line, grade, and cross section.
5. When placing the curb on existing pavement, thoroughly remove dirt and objectionable matter from the area receiving the curb.
6. Apply a tack coat at the rate directed by the Engineer to the full width of the curb being placed.

NOTE: Place sections of curb only after constructing adjoining spillways and drainage outlets.

436.3.04 Fabrication

General Provisions 101 through 150.

436.3.05 Construction

A. Mixing Asphaltic Concrete

Ensure that the asphaltic concrete manufacturer meets the requirements of Section 400, as applicable.

B. Placing Curb Material

When beginning construction, determine the working temperature of the asphaltic mixture to achieve the best results. Do not place curb material on an area where the surface temperature is below 40 °F (4 °C).

When the machine used to lay the asphaltic curb does not give adequate compaction as determined by the Engineer, take corrective measures to compact the finished curb adequately. These measures include, but are not limited to:

- Adjusting the mix
- Loading the machine with additional weight
- Using other corrective measures

C. Observing Tolerance

If the grade line is uniform, the curb can slump 0.25 in (6 mm) below the specified height.

D. Curing and Protecting the Curb

Protect the newly laid curb from traffic by using a barricade or other methods until the asphaltic mixture has cooled to air temperature. Once the curb is cool, immediately backfill it.

436.3.06 Quality Acceptance

General Provisions 101 through 150.

436.3.07 Contractor Warranty and Maintenance

Maintenance includes protecting the finished curb until Final Acceptance.

Remove and replace curb or curb sections displaced, destroyed, or damaged from Contractor negligence at no additional cost to the Department.

436.4 Measurement

Asphaltic concrete curb complete in place and accepted is measured in linear feet (meters) along the face of the curb.

Tack coat is measured and paid for according to Section 413.

436.4.01 Limits

General Provisions 101 through 150.

436.5 Payment

Asphaltic concrete curb measured for payment will be paid for at the Contract Unit Price per linear foot (meter) for each curb height. Payment is full compensation for furnishing materials, including bituminous material, preparing the subgrade or pavement surfaces, cleaning, hauling, mixing, placing and replacing if required, and maintaining the curb to complete the Item.

Payment will be made under:

Item No. 436	Asphaltic concrete curb___ in(mm)	Per linear foot (meter)
--------------	-----------------------------------	-------------------------

436.5.01 Adjustments

General Provisions 101 through 150.

Section 437—Granite Curb

437.1 General Description

This work includes furnishing and installing granite curb including excavating, and backfilling. Construct curb that conforms to the lines and grades shown on the Plans or established by the Engineer.

437.1.01 Definitions

General Provisions 101 through 150.

437.1.02 Related References

A. Standard Specifications

Section 805—Rip Rap and Curbing Stone

B. Referenced Documents

General Provisions 101 through 150.

437.1.03 Submittals

General Provisions 101 through 150.

437.2 Materials

Use granite curbing that meets the requirements of Subsection 805.2.02.

Ensure that Type A curbing with dressed surfaces is free from drill marks or other artificial blemishes.

437.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

437.3 Construction Requirements

437.3.01 Personnel

General Provisions 101 through 150.

437.3.02 Equipment

General Provisions 101 through 150.

437.3.03 Preparation

Prepare and excavate the foundation as follows:

1. Thoroughly tamp the bottom of the trench. Remove soft or yielding material to the depth ordered by the Engineer.
2. Refill the trench with stable material and tamp the material in 4 in (100 mm) layers or less.
3. Place the granite curb on a dry, firm foundation.

437.3.04 Fabrication

General Provisions 101 through 150.

437.3.05 Construction

A. Setting the Curb

Set the curb true to line and grade and closely fit the adjacent sections as follows:

1. Thoroughly ram and maul the curbing into place.

2. Immediately after setting the curb, place and compact the backfilling in 4 in (100 mm) layers or less. Use backfill material approved by the Engineer.
3. When setting the curb on a fill or placing more than 6 in (150 mm) of the curb above the surrounding ground, protect the curb by placing at least an 18 in (450 mm) wide bank of dirt behind it level with the top of the curb.
4. Divert the water away from the trench on steep grades or wherever there is a danger of water getting into the trench.
5. Lower the curb for driveways and alleys as directed. Cut and round curb sections adjacent to lowered curbs to 45 degrees.
6. Provide weep holes and drainage openings as indicated on the Plans.

437.3.06 Quality Acceptance

General Provisions 101 through 150.

437.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

437.4 Measurement

Granite curb complete and in place is measured for payment by the linear foot (meter) along the inner top exposed edge nearest the roadway centerline.

Measurement for payment is not made for foundation excavation, preparation, compaction, weep holes, or drainage openings.

437.4.01 Limits

General Provisions 101 through 150.

437.5 Payment

This item will be paid for at the Contract Unit Price per linear foot (meter) for straight curbs, radial, or curved curbs, complete in place and accepted.

Payment will be made under:

Item No. 437	Straight granite curb, [thick] in (mm) x [depth] in (mm), type ____	Per linear foot (meter)
Item No. 437	Circular granite curb, [thick] in (mm) x [depth] in (mm), type ____	Per linear foot (meter)

437.5.01 Adjustments

General Provisions 101 through 150.

Section 438—Precast Concrete Header Curb

438.1 General Description

This work includes furnishing and installing precast concrete header curb according to the Plans.

438.1.01 Definitions

General Provisions 101 through 150.

438.1.02 Related References

A. Standard Specifications

438.3.03 Preparation

General Provisions 101 through 150.

438.3.04 Fabrication

General Provisions 101 through 150.

438.3.05 Construction

A. Excavation

Excavate the subgrade to the required grade and cross section shown on the Plans or as directed by the Engineer.

Remove unsuitable material in the subgrade and backfill as necessary.

B. Precast Concrete Header Curb

Use precast concrete header curb as an alternate for granite curb when specified in the Plans.

1. Do not use it with existing or required granite curb, unless shown on the Plans or directed by the Engineer.
2. Make precast header curb in tangent sections only.
3. Pour curbed portions in place according to Section 441. Provide dowels or dowel holes in poured-in-place portions for tying in precast sections.
4. Ensure that precast sections conform to the dimensions and details on the Plans.

438.3.06 Quality Acceptance

General Provisions 101 through 150.

438.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

438.4 Measurement

Precast concrete header curb complete in place is measured per linear foot (meter). Excavation and backfill are not measured separately for payment.

438.4.01 Limits

General Provisions 101 through 150.

438.5 Payment

This Item measured for payment includes the required excavation, backfill, and incidentals to complete the Item.

Payment will be made under:

Item No. 438	Precast concrete header curb [height] in (mm)	Per linear foot (meter)
--------------	---	-------------------------

438.5.01 Adjustments

General Provisions 101 through 150.

Section 439—Portland Cement Concrete Pavement (Special)

439.1 General Description

This work includes constructing pavement composed of Portland cement concrete, with or without reinforcement as specified, on a prepared subgrade or subbase course.

Follow the requirements of these Specifications and conform with the lines, grades, thicknesses, and typical cross-sections shown on the Plans or established by the Engineer.

439.1.01 Definitions

General Provisions 101 through 150.

439.1.03 Submittals

A. Profilograph Certification

Before paving, ensure that the profilograph and operator are certified by the Office of Materials in accordance with Standard Operating Procedure No. 34, Certification of Contractor Personnel and Equipment for Smoothness Testing of Portland Cement Concrete Pavement with the Rainhart Profilograph. Certification includes a mechanical check of the profilograph functions and a written examination by the operator.

Request certification in writing to the Office of Materials at least two weeks before it is needed.

B. Report Form

Refer to Subsection 439.3.06.L, “Smoothness Testing” for report form and submittal requirements.

C. Concrete Design

Submit for approval a concrete design prepared by a testing laboratory approved by the Office of Materials. The Contractor will transmit the design to the Engineer for approval at least 35 days before use.

Or, submit for approval concrete mix proportions with commonly used materials without preparation by a laboratory. The Office of Materials may approve proportions based upon the past performance of the material combination.

439.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Portland cement	830.2.01
Portland Pozzolan cement	830.2.03
Water	880.2.01

Section 439-Portland Cement Concrete Pavement (Special)

Material	Section
Fine Aggregate, Size No. 10	801.2.02
Coarse Aggregate, Class A or B Crushed Stone or Gravel, Sizes as Specified	800.2.01
Steel Bars for Reinforcement	853.2.01
Steel Wire for Concrete Reinforcement	853.2.06
Welded Steel Wire Fabric for Concrete Reinforcement	853.2.07
Dowel Bars and Bar Coatings	853.2.08
Curing Agents	832
Air Entraining Admixtures	831.2.01
Fly Ash and Slag	831.2.03
Joint Fillers and Sealers	833
Low Modulus Silicone Sealant for Roadway Construction Joints	833.2.06
Epoxy Adhesive for Repairing Cracks	886.2.01
Chemical Admixtures	831.2.02

A. Fly Ash

Fly ash may be used as a concrete additive to promote workability and plasticity. Use it as a partial replacement for Portland cement in concrete, but follow these limits:

1. Do not replace the cement quantity more than 15 percent by weight.
2. Replace cement with fly ash at the rate of 1.25 to 2.0 lbs (1.25 to 2.0 kg) of fly ash to 1 lb (1.0 kg) of cement.
3. Ensure that the fly ash mix conforms to Subsection 430.3.06, [“Quality Acceptance.”](#)
4. Do not use Type IP cement in fly ash mixes.

B. Granulated Iron Blast-Furnace Slag

If high early strengths are not desired, use granulated slag as a partial replacement for Portland cement in concrete. Follow these limits:

1. Replace the quantity of cement 50 percent or less by weight if the 5-day forecast of the National Weather Service expects temperatures higher than 60 °F (15 °C).
 - a. If the 5-day expected low temperature is less than 60 °F (15 °C) but not less than 40 °F (4 °C), replace the quantity of cement 30 percent or less by weight.
 - b. If the 5-day expected low temperature is less than 40 °F (4 °C); do not use granulated slag.
2. Replace cement with slag at the rate of 1 lb (1.0 kg) of slag to 1 lb (1.0 kg) of cement.
3. Ensure that the granulated slag mix conforms to Subsection 430.3.06, “Quality Acceptance”.
4. Do not use Type IP cement or fly ash in slag mixes.

C. Composition of Concrete

Design the concrete mix to conform to the following requirements:

1. Coarse Aggregate

Use coarse aggregate size No. 467, 67, or 57 for plain Portland Cement concrete pavement.

Use size No. 67 or 57 coarse aggregate for continuous reinforced concrete pavement.

Separate size No. 467 or 456 in individual stockpiles of size No. 4 and size No. 67. Blend according to approved mix proportions.

2. Fine Aggregate

Use fine aggregate that meets the requirements for size No. 10.

When using two sizes or sources of fine aggregate to produce the proper gradation, blend according to the approved design proportions.

439.2.01 Delivery, Storage, and Handling

Store fine aggregate from different sources in different stockpiles.

439.3 Construction Requirements

439.3.01 Personnel

A. Certified Operator

Before paving, have the Office of Materials certify a profilograph equipment operator. Certification includes a written examination by the operator.

439.3.02 Equipment

A. Equipment Requirements

Provide equipment and tools to perform the work. Provide equipment that allows the paver to operate at a constant production rate and minimizes starting and stopping. The Engineer may limit the production rate or batch size if equipment does not keep pace with the other operations or causes poor workmanship.

B. Ramp Screeds and Hand Finishing Tools

Ramp screeds and hand finishing tools may be used instead of conventional mainline paving equipment.

C. Scales

Before use, the Engineer will inspect and approve the scales to weigh concrete materials and the devices to measure water. Tolerances are ± 1.0 percent throughout the operating range. Measure admixtures to ± 3.0 percent.

D. Protective Equipment

Provide materials to protect the concrete edges and surface against rain, including:

- Standard metal forms or wood planks to protect the pavement edges
- Covering material such as burlap or cotton mats, curing paper, or plastic sheeting material to protect the pavement surface

E. Auxiliary Vibrator

Keep one auxiliary vibrator available in case of mechanical malfunctions.

F. Texturing Equipment

Ensure that the tines on the equipment:

- Are the same size and length and are rectangular shaped
- Have approximately 0.5 in (13 mm) of space between them
- Are between 1/16 in and 1/8 in (2 mm and 3 mm) wide

439.3.03 Preparation

A. Prepare the Roadbed

Prepare the roadbed as required by the Plans and Specifications before placing concrete pavement.

B. Observe Condition of Subgrade and Subbase

Check the subgrade and subbase as follows:

1. Prepare the full width of the subgrade and subbase according to the Plans and Specifications.
2. Ensure that the surface immediately under the concrete pavement allows proper pavement thickness and yield.
3. Trim high areas to the proper elevation.
4. Ensure that the subbase can support paving equipment without rutting or bogging.

439.3.04 Fabrication

General Provisions 101 through 150.

439.3.05 Construction

A. Set Forms

Set the forms as follows:

1. Compact the foundation under the forms true to grade. Set the form so that it firmly contacts the foundation for the entire length at the specified grade.
2. Prevent the forms from settling or springing under the finishing machine.
3. Clean and oil the forms before placing the concrete.

B. Place Concrete

After depositing the concrete on the grade, avoid rehandling it. Unload and place it as follows:

1. Unload the concrete into an approved spreading device and mechanically spread it on the grade.
2. Place the concrete continuously between transverse joints without using intermediate bulkheads.
3. Perform any necessary hand spreading of concrete with shovels, not rakes.

<p>NOTE: Do not allow personnel to walk in freshly mixed concrete with shoes coated with dirt or other materials.</p>
--

4. Thoroughly consolidate the concrete on both sides of joint assemblies.
5. Ensure that vibration does not cause puddling or grout accumulation on the surface.
For construction or expansion joints, do not use grout that accumulates ahead of the paver.
6. Deposit concrete near the formed joints. Do not dump or discharge concrete on a joint assembly unless the concrete is centered on the joint assembly.
7. Keep reinforcing steel free of dirt, oil, paint, mill scale, and loose or thick rust that could impair the bond of the steel to the concrete.

C. Consolidate and Finish

Ensure that the sequence of operations is continuous from placement to final finish.

1. Consolidation

Perform vibration for the full width and depth of the pavement as follows:

- a. Do not allow the vibrators to misalign load transfer devices or contact forms or the foundation.
- b. Ensure that the operating frequency is within these ranges.
 - Use spud vibrators with an operating frequency of at least 7,000 vibrations per minute.
 - Use tube vibrators with an operating frequency of at least 5,000 vibrations per minute.
 - Use surface pan vibrators with an operating frequency of at least 3,500 vibrations per minute.
- c. Use hand-held vibrators if needed.

Section 439-Portland Cement Concrete Pavement (Special)

Ensure that the operating frequency is at least 4,500 vibrations per minute. The intensity shall be sufficient to affect the mass of concrete having a 1 in (25 mm) slump through a radius of at least 18 in (450 mm).

- d. Obtain uniform consolidation and density throughout the pavement.

If the pavement is not uniform, stop the operation and provide methods or equipment that will produce pavement that conforms to the Specifications.

- e. Keep a standby vibratory unit available in case a primary unit malfunctions.

2. Finishing

After striking off and consolidating the concrete, follow these steps:

- a. The concrete may be smoothed and trued using a hand float.
- b. Ensure that the surface within 6 in (150 mm) of the pavement edge shows no more than a ¼ in (6 mm) deviation in 10 ft (3 m) when tested with a 10 ft (3 m) straightedge in both transverse and longitudinal directions.
- c. Ensure that mainline riding surface produces a profile index value of less than 7 in/ mile (100 mm/km) on each travel lane.

D. Protection from Rain

Protect the unhardened concrete from rain. See Subsection 439.3.02.D, “Protective Equipment.”

When rain is imminent, stop paving operations and place forms against the sides of the pavement. Cover the surface of the unhardened concrete with the protective covering.

E. Remove Forms

Remove forms from in-place concrete after it has set for at least 12 hours, unless otherwise provided.

1. Remove forms carefully to avoid damaging the pavement.
2. After removing the forms, immediately cure the sides of the slab using the same method used to cure the pavement surface.
3. Remove and replace major honeycombed areas.

F. Work at Night

Provide adequate lighting for work performed at night. If lighting will not be provided at night, stop the concreting operation in time to finish and saw during daylight hours.

G. Provide Joints

Ensure that joints are designed, configured, and located as shown on the Plans or required by the Specifications.

1. At the Engineer’s discretion, remove and replace plain concrete pavement that cracks during construction with no additional cost to the Department.
2. When chipping out random cracks for sealing, use nonrigid epoxy that meets Subsection 886.2.01 on cracks that are not under expansion-contraction influence.
3. Seal continuous cracks under movement with sealant that meets Subsection 833.2.06.
4. When removing and replacing a pavement section, replace an area at least 6 ft (1.8 m) long and the full width of the lane.
 - a. Saw to vertical face the sections to be removed and replace the concrete as a construction joint with dowels.
 - b. Use deformed bars as dowels in the saw-cut construction joint. Use the size specified for contraction joints in the Plans.
5. Thoroughly clean the drilled holes of contaminants and set the dowels into the hardened concrete face of the existing pavement with a Type VIII epoxy bonding compound. See Section 886 for epoxy bonding compound requirements.
6. For contraction joints, undamaged and properly positioned dowels may be used in existing construction or slab replacement areas. Coat the protruding dowel portions with a thin film of heavy grease.

7. When both sides of an existing construction or contraction joint require slab replacements, slabs may be replaced continuously from saw-cut construction joint to saw-cut construction joint. Use dowels specified for contraction joints.
8. Before placing concrete, uniformly apply a thin coat of heavy grease to epoxy-coated dowels.
9. When placing slabs continuously across transverse contraction joint locations, use saw-cuts to provide planes of weakness according to the requirements of this Specification and the GDOT construction standard for contraction joints.
10. Seal the joints according to the Plans.

H. Determine Types of Joints

1. Longitudinal Joints

Longitudinal joints shall contain unpainted and uncoated deformed steel bars that are the size and length specified on the Plans.

Place the bars perpendicular to the joint using a mechanical device, or rigidly secure the bars in place with supports.

2. Longitudinal Formed Joints

Construct longitudinal formed joints while the concrete is in a plastic state.

Use methods and equipment that locates the joint reinforcement properly without disrupting it during construction.

3. Longitudinal Sawed Joints

Cut longitudinal sawed joints with a mechanical saw within three days after the concrete is placed and before traffic or equipment enters the pavement.

4. Transverse Joints

Transverse joints consist of construction joints, contraction joints, or expansion joints constructed at required locations.

- a. Construct transverse joints in partial width or adjoining lanes to abut the same joint of adjacent lanes unless otherwise specified on the Plans.
- b. Ensure that transverse joints in plain Portland Cement concrete requiring load transfer devices contain either plastic-coated or epoxy-coated dowels.
- c. Before placing concrete, secure dowel bars in place with supporting assemblies.
- d. Secure the assemblies in position on the subbase to keep the dowels from moving during concrete placement.
- e. Place dowel bars to a vertical and horizontal tolerance of ± 1 in (± 25 mm) of the Plan position. Do not misalign the dowel bar more than $3/8$ in per foot (10 mm per 300 mm) in the horizontal or vertical plane.
- f. Remove and replace dowel assemblies displaced from the Plan position more than the tolerances in Subsection 430.3.05.J, "Provide Joints."
- g. When using epoxy-coated dowels, coat the entire surface with a thin film of heavy waterproof grease.
- h. Ensure accurate positioning of transverse sawed joints by marking the position of dowel bar assembly locations.

5. Construction Joints

Construct transverse construction joints when interrupting concreting operations for more than one hour.

<p>NOTE: Do not construct transverse construction joints within 10 ft (3 m) of an expansion joint, contraction joint, or transverse plane of weakness.</p>

- a. Move an unanticipated construction joint back to the last Plan joint and remove and dispose of excess concrete.
- b. Form construction joints by securing in place a removable bulkhead or header board.
 - 1) Place the board so that it conforms to the full cross section of the pavement. Secure it flush with the subbase and parallel to the normal transverse joints.
 - 2) Slot or drill the board to allow placement of reinforcement as required by the Plans.

NOTE: Do not use the roll of laitance and grout that forms in front of the paver adjacent to transverse construction joints.

- c. Consolidate to full width and depth concrete adjacent to transverse construction joints with mechanical hand-type spud vibrators. Keep one auxiliary vibrator available in case of mechanical malfunctions.
- d. Before applying the final finish to the concrete, stringline and correct variations of the concrete surface within 30 ft (9 m) on either side of the transverse construction joints. Provide equipment and tools such as:
 - Work bridges
 - Personnel
 - String lines
 - Straightedges
 - Lighting
- e. While the concrete is in a plastic condition, stringline the surface longitudinally and correct surface deviations greater than 1/8 in. in 15 ft (3 mm in 4.6 m) in any direction.
- f. When using Plain Portland cement concrete pavement, place dowel bars in construction joints. Cast half the length of each dowel bar in the concrete during each phase of joint construction.
- g. After the concrete has hardened, dismantle the bulkhead supporting the dowels. Do not disturb the dowels.
- h. When using epoxy coated dowels, coat the protruding half of each dowel bar with a thin film of heavy waterproof grease before resuming joint construction. Grease coating is not required on plastic coated dowels.

6. Contraction Joints

Create planes of weakness in plain Portland cement concrete pavement by cutting joints in the pavement surface. Create the planes according to the Plans and as follows:

- a. Saw transverse contraction joints before the pavement cracks. Begin sawing when the concrete has hardened enough to prevent surface raveling, usually 4 hours after placement but no more than 24 hours.
- b. Continue sawing day and night regardless of weather conditions.

7. Expansion Joints

Transverse expansion joints are required at locations shown on the Plans.

- a. Form expansion joints by securing a removable bulkhead that conforms to the full cross section of the pavement. Use bulkheads that can construct a vertical expansion wall without offsets, indentations, or burrs.
- b. Use expansion joint filler required by the Plans.
- c. Furnish and install preformed joint filler in lengths equal to the pavement width or the width of one lane. Do not use damaged or repaired joint fillers.
- d. Position the expansion joint filler vertically in the joint and at the proper grade. Use an installing bar or other device to secure the expansion joint filler at the proper grade and alignment.

I. Seal the Joints

Clean and seal the joints according to Section 461 and the Plans.

Immediately after completing the curing period, fill in the joints with joint sealing material before opening the pavement to traffic.

J. Cure the Concrete

Immediately after finishing the concrete, cure the entire surface when the concrete will not mar. Use one or more of these methods:

1. Impervious Membrane Method

To use this method:

Section 439-Portland Cement Concrete Pavement (Special)

- a. Spray the entire surface of the pavement with white pigmented curing compound immediately after finishing the surface and before the concrete has set.

If the pavement is cured initially with cotton mats, burlap, or cotton fabric, apply the compound after removing the mats.

NOTE: Do not apply curing compound during rain.

- b. Use mechanical sprayers to apply curing compound under pressure at a minimum rate of 1 gal per 150 ft² (1 L per 3.5 m²).
Use fully atomizing spraying equipment that is equipped with a tank agitator.
- c. Thoroughly mix the curing compound immediately before use.
- d. During application, use a mechanical device to stir the compound continuously.
- e. If required, use a hand sprayer to spray odd widths, odd shapes, and concrete surfaces exposed by removing forms.
- f. Do not apply curing compound to the inside faces of joints to be sealed.
- g. If the membrane film becomes damaged within the curing period, repair the damaged portions immediately with additional compound.

2. White Polyethylene Sheeting

To use this method:

- a. Cover the top surface and sides of the pavement with polyethylene sheeting. Lap the units at least 18 in (450 mm).
- b. Place the sheeting and weigh it down so that it contacts the surface.
- c. Extend the sheeting beyond the edges of the slab at least twice the thickness of the pavement.
- d. Unless otherwise specified, maintain the covering in place for 72 hours after placing the concrete.

3. Burlap, Cotton Fabric, or Other Methods

Contractors may cure the pavement surface with burlap, cotton fabrics, or other materials if the section remains wet for the duration specified by the Engineer.

4. Cold Weather Curing

To use this method:

- a. Remove and replace concrete that freezes before the initial set time at no additional cost to the Department.
- b. Use polyethylene or canvas to protect concrete that has set but is exposed to freezing temperatures within 24 hours of placement. Ensure that the internal concrete temperature is above freezing for at least 24 hours after placing the concrete.
- c. Obtain approval from the Engineer to use other protection methods such as hay, straw, or grass, or to change the duration of the protection.

K. Open Pavement to Traffic

Wait to open the pavement slab to traffic, except for joint sawing vehicles, until the concrete is 14 days old unless representative compressive tests show that the slab has a compressive strength of 2,500 psi (15 MPa).

Prevent pavement slab stress by constructing a ramp of compacted earth or other material to move on and off the pavement. Do not allow equipment that exceeds legal load limits on the pavement.

Protect the pavement against traffic from the public, employees, and agents.

1. Erect and maintain barricades. Employ watchmen to block traffic from the newly constructed pavement for the period required in this Specification.
2. Arrange the barriers away from public traffic on lanes remaining open.
3. Maintain signs that clearly indicate the lanes open to public traffic.

Section 439-Portland Cement Concrete Pavement (Special)

4. If traffic must go across the pavement, construct crossings satisfactory to the Engineer to bridge over the concrete. Construct the crossing without additional compensation.
5. Repair or replace pavement damaged by traffic or other causes before Final Acceptance without additional compensation. Make repairs to the Engineer’s satisfaction.

439.3.06 Quality Acceptance

The typical section sheet in the Plans specifies concrete classifications for specific uses.

This Specification establishes minimum requirements for these concrete classifications for concrete design approval, concrete mix design proportions, batching control responsibilities, and acceptance of hardened concrete based upon compressive strength development.

Produce Portland cement concrete by combining proportions of approved materials in batches according to the construction methods specified in this Specification.

Mix concrete produced in a stationary central mix plant for at least 60 seconds after the materials enter the drum. Mix time may be reduced if the representative tests show that the concrete meets requirements of ASTM C 94, Requirements for Uniformity. Never mix less than 50 seconds.

A. Transit Mixed Concrete

Ensure that transit mixed concrete meets the requirements of Subsection 500.3.04.E.3, [“Transit-Mixed Concrete.”](#)

B. Mix Design Criteria

Proportion concrete mix designs using the following requirements:

	Minimum Cement per Cubic Yard Concrete (CWT)	Maximum Water-Cement Ratio (lbs/lb)	Design Air Content Range (%)	Minimum Compressive Strength at 28 Days (psi)
Class 3	5.64	0.53	4.0 to 5.5	3,000
Class HES	6.58	0.47	4.0 to 5.5	3,500

	Minimum Cement per Cubic Meter Concrete (kg)	Maximum Water-Cement Ratio (kg/kg)	Design Air Content Range (%)	Minimum Compressive Strength at 28 Days (MPa)
Class 3	335	0.53	4.0 to 5.5	20
Class HES	390	0.47	4.0 to 5.5	25

C. Compressive Strength

Prepare and test at least 6 cylinders according to AASHTO T 126 and T 22 to ensure that the demonstrated laboratory compressive strength at 28 days for Class 3 concrete is at least 4,000 psi (30 MPa), and the minimum laboratory compressive strength for Class HES concrete is 3,000 psi (20 MPa) at 72 hours.

D. Field Adjustments on Concrete Mixes

Determine the aggregate surface moisture and apply free moisture corrections to the approved mix design. The Engineer will verify that the corrections are made properly.

Adjustment may be made to the approved proportions of the fine and coarse aggregate and water provided:

- The cement factor is not decreased.
- The water-cement ratio is not increased.

Section 439-Portland Cement Concrete Pavement (Special)

- Adjustments produce concrete proportions according to this Specification.
- The Engineer is notified before use.

E. Concrete Mix Tolerances

Ensure that concrete consistency and air content is maintained within the following limits:

1. Consistency

Immediately before placement, use GDT 27 to determine concrete slump. Do not use concrete for Portland cement concrete pavement with a slump value greater than 3.5 in (90 mm).

2. Air Content

Immediately before placement, use GDT 26, GDT 28, or GDT 32 to determine the air content of the concrete. Concrete will not be accepted that has an air content outside of the following limits:

Lower acceptance limit	3.0%
Upper acceptance limit	6.5%

F. Concrete Strength Acceptance

1. Class 3

Portland cement concrete pavement strength will be accepted based on compressive strength development at 28 days. The compressive strength value shall be at least 3,000 psi (20 MPa).

- a. Fabricate and cure specimens for field acceptance according to AASHTO T 23.
- b. After curing, the OMR will test the cylinders according to AASHTO T 22. The test frequency is outlined in the Department's Sampling and Testing information.

2. Class HES

High early concrete strength pavement may be accepted based on compressive strength development at 72 hours. The compressive strength value shall be at least 3,000 psi (20 MPa).

When concrete is defective based on the 72-hour strength test and the concrete is retained for acceptability judgment, acceptance will be based on test results conducted at 28 days. The acceptance strength value shall be at least 3,500 psi (25 MPa).

- a. Cure specimens fabricated for 72-hour strength for 72 hours under conditions that are similar to those under which the pavement will be cured.
- b. Cure specimens fabricated for 28-day evaluation per AASHTO T 23.
- c. Test all specimens per AASHTO T 22.

G. Depth Measurement

The Engineer will designate pavement areas to be examined for depth measurement compliance with the Plan and Specifications.

Remove and replace areas deficient more than 1/4 in (6 mm). The Engineer may require a reduction in payment. Correct deficiencies in slab depth as directed by the Engineer.

H. Final Finish

Ensure that the final finish produces a pavement surface that is true to grade, uniform, and free of irregular, rough, or porous areas.

Produce the final surface finish using mechanical or hand-operated equipment to groove the plastic concrete. Use texturing equipment with rectangular-shaped spring steel tines.

I. Texture Depth Testing

Test the pavement surface to determine the texture depth by using GDT 72 at locations selected by the Engineer.

Transversely saw-groove areas that have a surface texture depth less than 0.02 in (0.5 mm). Ensure that the areas meet the average depth requirement of 0.04 in (0.9 mm) or greater. Saw-groove the areas to meet these dimensions:

- Width—1/8 in (3 mm)
- Depth—3/16 in (5 mm)
- Spacing—3/4 in center-to-center (19 mm)

J. Smoothness Profile

Include in the Contract Unit Bid Price the cost to furnish and operate a Rainhart (Model 860) Profilograph to measure pavement profile deviations.

Measure and correct pavement profile deviations as follows:

1. Ensure that the mainline riding surface produces a profile index value no greater than 7 in/mile (100 mm/km) on each travel lane. Conduct tests according to GDT 78.
Determine a profile index value for each tracing in each ¼ mile (0.5 km) segment.
2. Correct individual bumps or depressions that exceed the blanking band by more than 0.2 in (5 mm) at no additional expense to the Department.
3. Suspend paving operations if a profile index value exceeds 7 in/mile (100 mm/km) per lane for any segment. Take corrective action approved by the Engineer.
4. Test ramps, acceleration lanes, and deceleration lanes using GDT 78 to ensure that the average profile index value does not exceed 12 in/mile (200 mm/km) for the entire section length.
5. Correct individual bumps or depressions that exceed 0.2 in (5 mm) from the blanking band at no additional expense to the Department.
6. Take pavement profiles 4 ft (1.2 m) from and parallel to the new pavement edges for pavements greater than 16 ft (4.8 m) wide and up to 24 ft (7.2 m) wide. Test pavement 6 to 16 ft (1.8 to 4.8 m) wide parallel to and at the center line of the pavement section.
7. Begin the 0.25 mile (0.5 km) record segments at the first day's placement and continue until project completion, except as noted in this Specification.
Combine pavement sections less than 650 ft (200 m) approaching a bridge with the previous 0.25 mile (0.5 km) segment to determine the profile index.
8. Calculate as separate record segment sections 650 ft (200 m) or greater approaching a bridge and sections at Project limits.
9. Determine a separate profile index value according to GDT 78 for the 100 ft (30 m) of roadway approaching each end of a bridge, up to and including the joint with the approach slab.
Average the profile index from the right and left wheelpaths for each 100 ft (30 m) segment for each lane for each approach. Ensure that the average profile index value is no greater than 30 in/mile (500 mm/km).
10. Notify the Engineer before profile testing. The Engineer will verify the results by randomly selecting at least 1 out of every 10 consecutive record segment profiles to compute the profile index and to compare with Contractor results.

K. Pavement Tolerances

For Projects that include weigh-in-motion truck scales, follow these pavement tolerances:

1. Ensure that the Rainhart Profilograph readings do not exceed 5 in/mile (80 mm/km) in the 600 ft (180 m) approach to the scales and the 200 ft (60 m) beyond the scales.
2. Ensure that the rolling straightedge measurements show no deviation greater than 1/16 in (2 mm) within 10 ft (3 m).

L. Smoothness Testing

Perform smoothness testing as follows:

1. Perform and evaluate profiles from the first day of placement before continuing paving.

Section 439-Portland Cement Concrete Pavement (Special)

When the test run is complete and evaluated, the Engineer may require equipment adjustments to improve smoothness before paving continues.

2. Complete the report form furnished by the Engineer, and attach it to each day's profilograph tracings. Include the following information in each trace:
 - Project number
 - Beginning and ending station numbers
 - 500 ft (150 m) paving stations
 - Traffic direction
 - Lane number
 - Date paved and tested
 - Construction joint locations
3. Have the certified profilograph operator obtain and evaluate traces to be submitted to the Engineer. Provide results no later than the end of the second work day following placement.
4. For mainline pavement, correct 0.25 mile (0.5 km) segments that do not meet the profile index requirement by using one of these methods:
 - a. Grind the entire lane surface of the 0.25 mile (0.5 km) segment to a profile index value no greater than 7 in/mile (100 mm/km). Use equipment that meets the requirements in Section 431.
 - b. Grind roughness in small segment areas no more than 50 ft (15 m) of full lane width to produce a profile index value no greater than 7 in/mile (100 mm/km).
If more than 50 ft (15 m) of grinding is required, grind the complete 0.25 mile (0.5 km) segment according to Method a, above.
5. Correct ramps and acceleration and deceleration lanes that do not meet the profile index requirement to a profile index no greater than 12 in/mile (200 mm/km). Prevent individual bumps from exceeding 0.2 in (5 mm) from the blanking band. Use equipment specified in Section 431.
6. Correct 100 ft (30 m) bridge approach sections that do not meet the profile index requirement.
 - a. Grind according to Section 431.
 - b. Use a bump grinder to correct bumps with a baseline of 5 ft (1.5 m) or less.
 - c. Grind the full lane width even when grinding individual bumps.
 - d. Retest pavement segments containing corrective slab replacements for Final Acceptance.
7. Correct segments that do not meet the profile index criteria of this Specification at no additional expense to the Department. Retest segments after correction with the Rainhart Profilograph as specified.
8. The Engineer may conduct profilograph tests at any time to verify Contractor results. The Department may test record segments if the Engineer determines that the Contractor test results are inaccurate. If this occurs, see Subsection 439.5.01, "Adjustments."

M. Acceptance

Pavement smoothness will be accepted when:

- The Engineer determines that the work was satisfactorily performed according to the Specifications.
- The completed pavement, including corrective Work, meets the applicable profile index value requirements.

439.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

439.4 Measurement

Portland cement concrete pavement (special) complete, in-place and accepted, is measured by the square yard (meter).

Section 439-Portland Cement Concrete Pavement (Special)

439.4.01 Limits

General Provisions 101 through 150.

439.5 Payment

Concrete pavement completed and accepted will be paid for at the full Contract Unit Price per square yard (meter).

Payment is full compensation for furnishing and placing materials, reinforcements, dowels, joint materials, supplies, and incidentals to complete the work.

Payment will be made under:

Item No. 439	Plain Portland cement concrete pavement, Class 3	Concrete _____ in (mm) thick	Per square yard (meter)
Item No. 439	Plain Portland cement concrete pavement, Class HES	Concrete _____ in (mm) thick	Per square yard (meter)
Item No. 439	Continuously reinforced concrete pavement, Class 3	Concrete _____ in (mm) thick	Per square yard (meter)
Item No. 439	Continuously reinforced concrete pavement, Class HES	Concrete _____ in (mm) thick	Per square yard (meter)

439.5.01 Adjustments

A. Profilograph Tests

If based on the Department's profilograph tests, the Engineer determines that the Contractor profilograph test results are inaccurate, the Contractor will be charged for profilograph testing at \$500 for each trace mile (\$250 for each trace kilometer) with a minimum charge of \$500.

Section 440—Plain Portland Cement Concrete Shoulders

440.1 General Description

The work includes constructing plain Portland cement concrete shoulders on a prepared subgrade or subbase according to these Specifications. Construct the shoulders to conform with lines, grades, thicknesses, and cross sections shown on the Plans or established by the Engineer.

440.1.01 Definitions

General Provisions 101 through 150.

440.1.03 Submittals

A. Concrete Mix Design

Submit to the Engineer a concrete mix design prepared by a qualified testing laboratory. The Engineer will transmit the design to the Office of Materials for approval. Ensure that the concrete mix design conforms to Subsection 440.2.A, “Composition of Class SP Concrete.”

440.2 Materials

Use materials that conform to Subsection 430.2, [“Materials.”](#) for Portland cement concrete pavement, or Subsection 815.2.01 for graded aggregate. Gradation requirements are modified to require 30 to 45 percent by weight to pass the No. 10 (2 mm) sieve for graded aggregate.

A. Composition of Class SP Concrete

Ensure that the concrete mix design conforms to the following requirements:

1. Aggregates
 - a. Shoulders Not Constructed In Continuity With Travel Lanes
 - 1) Graded Aggregate meeting the requirements in Subsection 815.2.01 and as modified in Subsection 440.2, “Materials” may be used if the shoulders are not constructed in continuity with travel lanes.
 - 2) Graded aggregate may be used as the coarse and fine aggregate portions of the concrete mix except that the gradation is modified to require 30 to 45 percent passing the No. 10 (2 mm) sieve.
 - 3) Use aggregates manufactured to meet the gradation at the quarry or blended at the plant site to produce the desired results. Ensure a uniform aggregate gradation when charging the mixer.
 - b. Shoulders Constructed in Continuity with Travel Lanes

Use concrete aggregate in shoulders constructed in continuity with travel lanes as specified in Subsection 430.2.C, [“Composition of Concrete”](#) and Subsection 430.2.C.2, [“Fine Aggregate”](#).

2. Mix Design Criteria

Base the proportions of Class SP concrete mix designs on the following requirements:

	Minimum Cement Content per Cubic Yard (meter) Concrete CWT (kg)	Maximum Water- Cement Ratio lbs/lb (kg/kg)	Design Air Content Range (%)
Class SP Concrete	4.25 (250)	0.75 (0.75)	5.0 to 7.0

3. Fly Ash

Use fly ash as an additive in concrete to promote workability and plasticity or as a partial replacement for Portland cement if the following limits are met:

- a. Replace the cement quantity no more than 15 percent by weight.
- b. Replace cement with fly ash at the rate of 1.25 to 2 lbs (1.25 to 2.0 kg) of fly ash to 1 lb (1.0 kg) of cement.
- c. Do not use type IP cement in fly ash mixes.

Calculate the water-cement ratio based on the total cement material in the mix including fly ash.

Construct Portland cement concrete shoulders with the same class of concrete required in the adjacent sections when constructed in continuity with travel lanes, ramps, acceleration lanes, deceleration lanes, or other sections.

Produce evidence that the proportions have the potential for strength development at 28 days as required in Subsection 440.3.06.B, [“Approval of Mix Design Proportions”](#).

440.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

440.3 Construction Requirements

440.3.01 Personnel

General Provisions 101 through 150.

440.3.02 Equipment

Use equipment that meets the requirements in Subsection 430.3.02, [“Equipment.”](#)

440.3.03 Preparation

Prepare the roadbed as required by the Plans and Specifications before placing the concrete shoulder.

Ensure that the foundation immediately under the concrete shoulder and the areas supporting the paving equipment will not contribute to deficient shoulder thicknesses or excessive yield losses.

440.3.04 Fabrication

General Provisions 101 through 150.

440.3.05 Construction

A. Placing Concrete

Place concrete as follows:

1. Deposit the concrete on the grade; do not rehandle it if possible.
2. Unless truck mixers, truck agitators, or non-agitating hauling equipment are equipped to discharge concrete without segregation, concrete shall be unloaded into an approved spreading device and mechanically spread on grade.
3. Place it continuously between transverse joints without using the intermediate bulkheads.
4. Perform any necessary hand spreading with shovels.

NOTE: Do not allow personnel to walk in freshly mixed concrete with shoes coated with harmful substances.

5. Thoroughly consolidate with vibration the concrete against and along the form faces and along the full length and both sides of joint assemblies.
6. Do not continue vibration if puddling or excessive grout accumulates on the surface.

NOTE: Do not use grout that accumulates ahead of the paver in construction or expansion joints.

7. Deposit concrete near formed joints. Do not dump or discharge concrete onto a joint assembly unless the concrete is centered on the joint assembly.

B. Placing Reinforcement

Place the reinforcement according to details on the Plans. Do not allow reinforcement placement to disrupt or damage the concrete. Do not insert lane tie bars into unsupported sides of fresh concrete.

C. Achieving Consolidation

Vibrate the full width and depth of the shoulder. Do not allow the vibrators to contact the foundation, load transfer devices, side forms, or joints.

If the vibrator does not produce uniform consolidation and density, stop the operation to furnish methods or equipment that will produce pavement according to the Specifications.

D. Finishing

Finish the concrete pavement as follows:

1. Smooth and true the concrete to the proper cross-section with hand floats or mechanical floats.
2. Ensure that the surface conforms to the required cross section and contains no irregular, rough, or porous areas.
3. Make the surfaces flush at the joint between the roadway and shoulder.
4. Finish the surface to provide a uniform texture in all areas except rumble strips. Use mechanical equipment for grooving plastic concrete, brooming, or burlap drag.
5. Form rumble strips in the shoulder surface according to the Plans.

E. Cleaning Up

Immediately after finishing, remove the loose material and clean the grout from the surface of adjacent lanes.

F. Constructing Joints

Use the joint, type of filler, and type of sealer designated in the Plans.

Construct joints according to Subsection 430.3.05.J, [“Provide Joints.”](#) Section 461, and the following:

1. Transverse Contraction Joints

Saw transverse contraction joints in the shoulder to abut like joints in the roadway, or construct joints as shown on the Plans.

2. Longitudinal Joints

- a. On the longitudinal joint adjacent to the adjoining lane, place reinforcement at locations shown on the Plans.
- b. Secure the reinforcement in place with supporting assemblies or by inserting into supported sides of fresh concrete, or by using mechanical equipment to insert them while placing concrete.

3. Construction Joints

Form transverse construction joints when concreting operations will be interrupted for more than 1 hour. Construct the joint according to Subsection 430.3.05.K.5, [“Construction Joints.”](#) except stringline requirements are 1/4 in (6 mm) maximum deviations in 15 ft (4.5 m).

G. Curing

Cure concrete according to Subsection 430.3.05.L, [“Cure the Concrete.”](#)

H. Permitting Traffic on Shoulders

Before using a shoulder as a haul road for loaded or unloaded vehicles:

1. Ensure that compressive strength tests show the concrete has developed at least 2,000 psi (14 MPa) and is at least 7 days old.
2. Construct earth ramps to facilitate movement across the shoulder. Place barricades to prevent traffic encroachment.
3. Seal the joints before permitting vehicles or equipment on the shoulder.

440.3.06 Quality Acceptance

A. Concrete Mixing

Produce Portland cement concrete shoulders using Class SP concrete as follows:

1. Combine authorized proportions of approved materials in homogenous batches according to the construction methods in this Specification.
2. Mix concrete produced in a stationary central mix plant for at least 60 seconds after placing materials in the drum.
3. Reduction of the mix time may be allowed if representative tests show that the concrete meets requirements of ASTM C 94, Requirements for Uniformity, but never reduce the mix time to less than 50 seconds.
4. Ensure that transit mixed concrete meets requirements in Subsection 500.3.04.E.3, [“Transit-Mixed Concrete.”](#)

B. Approval of Mix Design Proportions

The Office of Materials will review concrete mix designs and will verify that compressive strength development is according to AASHTO T 126 and T 22.

The Department will approve material combinations and mix designs using approved materials and complying with Subsection 440.2.A, [“Composition of Class SP Concrete.”](#) and the following:

1. Flexural Strength

Take at least 5 normally cured flexural specimens to ensure that the 28-day laboratory flexural design strength is according to AASHTO T 126 and T 97 and is within the following design acceptance range (DAR).

Class SP Concrete DAR = $400 \text{ psi} \pm .67s$ ($2.8 \text{ MPa} \pm .67s$)
where s = The standard deviation of 28-day flexural specimens for a combination of materials and mix proportions prepared together. Do not use a value of s greater than 37 psi (255 kPa) to calculate DAR.

A mixture may be used that exceeds the upper limit of the DAR.

2. Compressive Strength

Prepare and test 6 cylinders according to AASHTO T 126 and T 22 to determine the 28-day laboratory compressive strength for Class SP concrete. Ensure that it exceeds the following minimum laboratory performance value (LPV).

Class SP Concrete LPV = $2,000 \text{ psi} + .18R$ ($13.8 \text{ MPa} + .18R$)
where R = The difference between the largest observed value and the smallest observed value for 28-day compressive strength specimens for a combination of materials and mix proportions prepared together.

C. Field Adjustments on Concrete Mixes

Determine the aggregate surface moisture and apply free moisture corrections to the approved mix design. The Engineer will verify that these corrections are made properly.

Adjustments to the approved proportions of the fine aggregate, coarse aggregate, and water may be made according to these guidelines:

- Do not decrease the cement factor.
- Do not increase the water-cement ratio.
- Ensure that adjustments produce concrete proportions according to this Specification.
- Notify the Engineer before making adjustments.

Section 440-Plain Portland Cement Concrete Shoulders

D. Concrete Mix Tolerances

Ensure that variations in consistency and concrete air content are within the following limits:

1. Consistency

Immediately before placing, determine concrete slump using GDT 27. Concrete for Portland cement concrete shoulders will not be accepted if the slump value is greater than 3 in (75 mm).

2. Air Content

Determine the concrete air content immediately before placement using GDT 26 or GDT 32.

Concrete will not be accepted with an air content outside the following limits:

Lower acceptance limit	3.0 percent
Upper acceptance limit	7.5 percent

E. Acceptance of Concrete Strength

Portland cement concrete shoulder strength shall be accepted based upon its 28-day compressive strength development.

1. Subdivide the shoulder into separate lots of approximately 7,000 yd² (5850 m²) of concrete shoulder placed continuously, except for overnight or other minimal discontinuance.
2. Randomly select three production units from each lot for strength determination tests.
3. Cast one set of cylinders for each production unit being tested.
4. A set consists of two 6 by 12 in (150 by 300 mm) cylinders cured according to AASHTO T 23. The test is the average strength of the two cylinders tested according to AASHTO T 22.
5. Determine lot strength acceptance according to the limits in the Pay Factor Schedule for Strength Determinations at 28 Days table.
 - a. If the average strength of the lot, based on the three acceptance tests, does not meet the lower acceptance limit shown in the 1.00 pay factor, the Contractor may leave the lot in place at a reduced Unit Price according to the Pay Factor Schedule for Strength Determinations at 28 Days.
 - b. If the average strength of the lot does not attain the lower acceptance limit shown for a 0.70 pay factor, the Engineer may order the removal of any or all of the concrete in the lot.

Pay Factor Schedule for Strength Determinations at 28 Days			
Acceptance Limits for Pay Factor Levels			
	1.00 LAL*	0.95 LAL	0.70 LAL
Class SP Concrete	2000 psi (13.8 MPa)+ 0.18 R	2000 psi (13.8 MPa) - 0.07 R	2000 psi (13.8 MPa) - 0.30 R
* Lower Acceptance Limit (LAL)			

The pay factor is 0.50 for concrete that remains in place when outside the 0.70 pay factor limits for compressive strength.

F. Thickness Tolerances

Determine the thickness by measuring the fresh concrete depth at the shoulder edges at least every 500 ft (150 m) of shoulder length.

The Engineer will evaluate areas deficient by more than 1 in (25 mm) thick. If the Engineer requires removal, remove and replace the shoulder pavement in full cross sections according to Plan requirements.

If removal and replacement are not required, payment is made at 50 percent of the Contract Unit Price for areas deficient by more than 1 in (25 mm). Areas that are deficient by more than 0.5 in (13 mm) through 1 in (25 mm) will be paid for at 70 percent of the Contract Price per square yard (meter).

440.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

440.4 Measurement

The work to be paid for under this Item is the number of square yards (meters) of Portland cement concrete shoulders completed and accepted as measured in place. The measurement width is the shoulder width shown on the Plan typical cross-section. The measurement length is along the surface at the inside edge of the paved shoulder.

440.4.01 Limits

General Provisions 101 through 150.

440.5 Payment

The work will be paid for at the Contract Unit Price per square yard (meter). Payment is full compensation for providing materials, reinforcement, equipment, and labor, mixing, hauling, handling, placing, and providing incidentals to complete the work.

Payment will be made under:

Item No. 440	Plain Portland cement concrete shoulders, type____	Per square yard (meter)
--------------	--	-------------------------

440.5.01 Adjustments

The Contract Unit Price per square yard (meter) of concrete shoulder will be adjusted for concrete shoulder accepted with a 28-day compressive strength or thickness deficiency.

If a shoulder section is deficient in thickness and compressive strength, the Contract Unit Price will be adjusted by the total reduction of the application of the two individual percentages shown in the Pay Factor Schedule and Subsection 440.3.06.F, “Thickness Tolerances.”

For combined deficiencies of 50 percent or more, the Engineer may allow the shoulder to stay in place or require its removal. If the Engineer requires shoulder pavement removal, the original pavement nor its removal will be paid for. Pavement replaced satisfactorily will be paid for at the appropriate Unit Price.

Section 441—Miscellaneous Concrete

441.1 General Description

This work includes placing Portland cement concrete as follows:

- As slope paving on end rolls, cut slopes, paved ditches, spillways, and ditch slopes
- In median pavement
- As sidewalks
- In concrete curbs, gutters, curb and gutters, and valley gutters
- As nonreinforced headwalls
- As velocity dissipators and concrete slope drains
- As concrete spillways
- Curb cut wheel chair ramps
- At other locations designated on the Plans or as directed

This work includes subgrade preparations including:

- Fine grading and backfilling
- Forming, furnishing, placing, and finishing concrete
- Constructing weep holes and furnishing and placing the coarse aggregate
- Furnishing and placing preformed joint fillers as shown on the Plans

- Placing driveway concrete as shown on the Plans. Nominal 4 in (100 mm) or 6 in (150 mm) thick as specified or to match existing pavement.

441.1.01 Definitions

General Provisions 101 through 150.

441.1.02 Related References

A. Standard Specifications

B. Referenced Documents

General Provisions 101 through 150.

441.1.03 Submittals

General Provisions 101 through 150.

441.2 Materials

Use concrete that conforms to the minimum requirements for Class “B,” as specified in [Section 500](#), except that a one-bag mixer may be used. The requirements of [Subsection 500.1.03.G](#), “Cold Weather Concrete Curing and Protection Plan” and [Subsection 500.3.05.X](#), “Pour Concrete in Cold Weather” for cold weather concrete placement are deleted.

Place miscellaneous concrete only when the air temperature is 40 °F (4 °C) and rising. Protect concrete from freezing for the first 24 hours. Hand finishing is allowed.

Other materials and their Specifications are as follows:

Material	Section
Steel Bars for Concrete Reinforcement	853.2.01
Membrane Curing Compound, Type 2	832.2.03
Dowel and Tie Bars and Reinforcing Steel	853.2.03
Joint Fillers and Sealers	833
Welded Steel Wire for Concrete Reinforcement	853.2.07

441.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

441.3 Construction Requirements

441.3.01 Personnel

General Provisions 101 through 150.

441.3.02 Equipment

A. Forms

Forms are subject to the Engineer's approval. Use forms that are:

- Wood or metal that is readily available
- Straight and oiled before each use

Use metal divider plates and templates.

Use the slip form placement method when applicable. If the slip form method does not produce a product with the proper quality, shape, grade, or alignment, the Engineer may require using fixed forms.

B. Weep Holes

Provide weep hole drain pockets filled with coarse aggregate to use with weep hole drain pipe or formed openings according to the Plan details.

441.3.03 Preparation

Before placing the concrete, excavate for toe walls, edge walls, and weep hole drain pockets; place coarse aggregate in weep hole drain pockets; and grade, finish, and compact the subgrade surface. Use mechanical tamps for compaction if necessary.

441.3.04 Fabrication

General Provisions 101 through 150.

441.3.05 Construction

A. Extent and Thickness of Pavement

See the Plans to determine the areas to be paved and the dimensions.

Thicknesses are subject to a minus tolerance of 0.5 in (13 mm). Do not perform overlay pours.

B. Preparation of Subgrade

Finish the subgrade for miscellaneous concrete to the line and grade on the Plans and the following:

1. Compact the subgrade to the same degree as the roadway on which it is placed. Compact the subgrade according to [Section 209](#).
2. If a Contract involves a Roadway and a Bridge Contractor, the Roadway Contractor shall complete the grading for the slope paving.
The Bridge Contractor shall complete final grading, compacting, dressing, placing, and maintenance to the structures until completion.
3. When placing paving on the front slopes of ditches and shoulders, place any required special materials during the roadway construction.
4. Do not excavate for velocity dissipators, spillways, and slope drains below the foundation elevation. Do not excavate wider than necessary to provide working space or to remove soft, unsuitable material. Backfill with selected material.
5. When fitting spillways to concrete pavement, set the specified dowel bars into the pavement when it is laid. Use metal parting strips to hold the ends of dowels bent into the grooves.

C. Concrete

1. Mixing

Mix Class B concrete as specified in [Section 500](#) with the following exceptions:

- a. Use of small capacity job-site batchers and one-bag mixers is allowed. The rate of concrete placement in [Subsection 500.3.05.P](#), "Meet the Minimum Placement Rates" is waived for miscellaneous concrete.

- b. Proportion concrete ingredients volumetrically if the Engineer has approved equipment calibration and operation and the operator is certified by the Office of Materials.

2. Placing and Finishing

Place and finish concrete as follows:

- a. Deposit concrete within forms or against other pavements on a compacted and wetted subgrade to the depth to produce the specified thickness.

NOTE: Do not place concrete on a muddy or frozen surface.

- b. Vibrate the headwalls.

- c. Strike off the concrete to a plane surface and finish it with a Type IV or Type V finish as defined in [Subsection 500.3.05.AB](#), “Finish Concrete” and complete the following:

- 1) **Concrete Slope Paving.** Give a final finish with a stiff-bristle broom. With the Engineer’s approval, mechanically convey the concrete to the forms.
- 2) **Concrete Sidewalks.** Give a Type V finish unless otherwise noted on the Plans. Test the surface with a 10 ft (3 m) straightedge laid parallel to the center line. Eliminate irregularities greater than 0.25 in (6 mm) per 10 ft (3 m) while the concrete is still plastic.

Ensure that concrete sidewalk constructed as curb cut (wheelchair) ramps has a rough or textured finish.

- 3) **Concrete Paved Ditches.** Ensure that the surface of the bottom and sides of paved ditches are uniform and true to grade and cross section.

Ensure that straight-grade tangents do not deviate more than 1 in (25 mm) within 10 ft (3 m) when tested with a 10 ft (3 m) straightedge. Do not allow deviation if it reduces the ditch paving thickness, causes water to pond, or alters the direction of flow.

Finish the ditch paving by floating with wood or metal floats to bring mortar to the surface to cover the coarse aggregate.

Use reinforcing that conforms to Plan details if required.

- 4) **Concrete Curbs, Gutters, and Median.** Finish according to [Subsection 441.3.05.C.2](#), “Placing and Finishing.” Remove face forms as soon as possible and finish the exposed surfaces with a wood float.

Use a straightedge to test the edge of the gutter and top of the curb and median to conform to the requirements for the adjacent pavement. Irregularities shall not exceed 0.25 in (6 mm) in 10 ft (3 m).

Place the curb and gutter using a machine as long as the results are satisfactory.

- 5) **Curb Cut Wheel chair Ramps.** Construct a Type I, II, or III ramp according to Georgia Standard 9031W. Tie ramps into adjacent paved or unpaved sidewalk and use a rough or textured finish.

3. Joints

Follow these procedures to construct joints on slopes, ditches, sidewalks, and curbs, gutters, and medians.

- a. Slope Paving

Place paving on slopes in horizontal or vertical courses, but not a mixture of both.

- 1) Construct horizontal courses approximately level and at least 3 ft (1m) but no more than 6 ft (1.8 m) wide measured along the slope.

When needed, construct trapezoidal courses at the top and bottom to accommodate sloping berm and ditch line conditions.

- 2) Edge the paving at construction joints between courses with a 0.25 in (6 mm) radius tool.

- 3) Provide vertical contraction or construction joints spaced along the horizontal course at right angles to the horizontal construction joints at approximately 40 ft (12 m) intervals, in line not staggered.

No other vertical lines will be required in horizontal courses.

When using vertical contraction joints, cut them with a tool one-third the depth of the paving during the finishing operation. Edge the contraction joints the same as construction joints.

Vertical courses approximately equal and at least 3 ft (1 m) but no more than 5 ft (1.5 m) wide across the plane of the slope. The desired width is 4 ft (1.2 m). Horizontal lines are not required in vertical courses. Separate slope paving from the masonry of structures, sidewalks, curbs, and rigid-type roadway pavements of preformed joint filler that are 0.5 in (13 mm) thick.

b. Concrete Paved Ditches

Form joints in concrete paved ditches as follows:

- 1) Space contraction joints at 30 ft (9 m) intervals.
- 2) Place expansion joints only where the paved ditch joins the roadway pavement or some other structure.
- 3) Do not use joint sealers for expansion or contraction joints.

c. Concrete Sidewalk

Form transverse contraction joints using a tool designed to form a groove one-third the depth of the sidewalk at intervals shown on the Plans.

Where sidewalks abut the curb and gutter, ensure that alternate joints coincide. Round the edges with a 0.25 in (6 mm) edger. Make expansion joints according to the materials, dimensions, and locations specified on the Plans.

d. Concrete Curbs, Gutters, and Medians

Form contraction joints or expansion joints on curbs, gutters, and medians.

- 1) **Contraction Joints.** Ensure that joints in curb, gutters, and medians are spaced the same as the joints in paving. Form joints by using metal divider plates or sawing them as in [Section 430](#).

Form joints at least one-fifth but not greater than one-fourth the depth of the concrete. Except for sawed joints, finish the joints with a 0.25 in (6 mm) edging tool.

For curbs, gutters, and medians adjacent to pavement other than concrete, contraction joints shall be as follows:

- For header curb and combination curb and gutter, install contraction joints spaced no more than 20 ft (6 m) apart.
- For gutter median, install a contraction joints spaced no more than 20 ft (6 m) apart.

- 2) **Expansion Joints.** Form expansion joints according to the Plan details or as directed. Ensure that they coincide with the expansion joints in the adjoining pavement or gutter.

Cut the joint fillers to the same cross section as the construction. Trim flush the material that protrudes after the concrete is finished.

When miscellaneous concrete items are not adjacent to concrete construction, provide expansion joints at an interval of at least 500 ft (150 m).

e. Curb Cut Wheelchair Ramps

Locate and form expansion joints for curb cut wheelchair ramps according to the Special Details for ramp Type A, B, C, or D.

4. Curing

Use curing methods specified in [Subsection 430.3.05.L](#), "Cure the Concrete." Ensure that the membrane curing compound is Type 2, if used. Pack honeycombed areas immediately after removing the forms.

D. Backfilling

Backfill the areas as soon as possible without damaging the work.

E. Clean-Up

When concrete work is complete, clean each surface. Protect the work from stains or other damage until Final Acceptance.

441.3.06 Quality Acceptance

General Provisions 101 through 150.

441.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

441.4 Measurement

A. Concrete Slope Paving

Concrete slope paving is measured for payment in square yards (meters) of accepted surface area of paving of the specified thickness. Concrete in toe or edge walls, excavation, backfill, weep holes, and aggregates are not measured for separate payment.

B. Concrete Sidewalks

Concrete sidewalks are measured in square yards (meters) of the specified thickness, complete in place and accepted. The length is the actual measured length along the surface. The width is the Plan width or as directed. Excavation and backfill are not measured separately for payment.

C. Concrete Paved Ditches

The area measured for payment is the square yards (meters) of exposed surface area, exclusive of top edges, of the specified thickness placed according to the Plans or as directed. Reinforcing steel, excavation, preparation of subgrade including Type I backfill, forms, and concrete in toe or edge walls are not measured separately for payment.

Type II backfill, when required, will be paid according to [Section 207](#).

D. Concrete Curbs, Gutter, Median, Pavement, and Combination Curb and Gutter

The following are measured by the linear foot (meter) along the face of the curb:

- Concrete curb and gutter
- Concrete curb
- Concrete header curb

The following are measured by the square yard (meter) or by the linear foot (meter), whichever is specified:

- Concrete gutter
- Concrete valley gutter
- Concrete valley gutter with curb
- Concrete median pavement
- Concrete gutter with raised edge

The length used to compute the square yards (meters) or linear foot (meter) is measured along the center line of the gutter. The width is the total width of the gutter including the curb or raised edge. Concrete doweled integral curb includes dowels.

E. Concrete Headwalls

Headwalls are measured for payment according to [Subsection 500.4.01.B](#), "Payment per Cubic Yard (Meter)" and [Subsection 500.5.01.E](#), "Filler Concrete." Filler concrete, where required, will be paid for at 60 percent of the Contract Unit Price for Class B concrete.

F. Concrete Spillways

Concrete spillways regardless of the type specified are measured by the actual number poured complete and accepted.

G. Concrete Slope Drains

Concrete slope drains are measured in square yards (meters) along the surface, complete and accepted.

H. Velocity Dissipators

Velocity dissipators are measured in square yards (meters), surface measure, complete and accepted.

I. Concrete Driveways

Driveway pavement is measured along the surface from the paving edge or back of the curb to where old and new concrete join. The width is the average width constructed.

J. Curb Cut Wheelchair Ramps

For new construction, curb cut wheelchair ramps will not be measured. For new construction, linear feet (meters) of curb and gutter will include the transitioned curb in front of ramps and square yards (meters) of concrete sidewalk will include ramps. No additional payment will be made for curb cut ramps.

For existing sidewalks, curb cut wheelchair ramps are measured as the actual number formed and poured, complete and accepted. No additional payment will be made for sawing existing sidewalk and removal and disposal of removed material for new ramp construction.

441.4.01 Limits

General Provisions 101 through 150.

441.5 Payment

These Items, measured as specified above, will be paid for at the Contract Unit Price per each, per square yard (meter), per linear foot (meter), or per cubic yard (meter).

Payment will be made under:

A. Slope Paving

Item No. 441	Concrete slope paving [<u>thick</u>] in (mm)	Per square yard (meter)
--------------	--	-------------------------

B. Sidewalks

Item No. 441	Concrete sidewalk (<u>thick</u>) in (mm)	Per square yard (meter)
--------------	--	-------------------------

C. Concrete Ditches

Item No. 441	Plain concrete ditch paving (<u>thick</u>) in (mm)	Per square yard (meter)
Item No. 441	Reinforced concrete ditch paving (<u>thick</u>) in (mm), including reinforcing steel	Per square yard (meter)

D. Curbs, Gutters, Combination Curb and Gutter, Headers, and Medians

Item No. 441	Concrete curb and gutter, (<u>thick</u>) in (mm)x (<u>width</u>) in (mm)type____	Per linear foot (meter)
Item No. 441	Concrete header curb, [<u>height</u>] in (mm), type____	Per linear foot (meter)
Item No. 441	Concrete valley gutter, [<u>thick</u>] in (mm)	Per square yard (meter)
Item No. 441	Concrete valley gutter with curb, [<u>thick</u>] in (mm)	Per square yard (meter)
Item No. 441	Concrete gutter with raised edge, [<u>thick</u>] in (mm)	Per square yard (meter)
Item No. 441	Concrete median [<u>thick</u>] in (mm)	Per square yard (meter)
Item No. 441	Concrete median, corrugated [<u>thick</u>] in (mm)	Per square yard (meter)

Section 441-Miscellaneous Concrete

Item No. 441	Concrete doweled integral curb, type___ including dowels	Per linear foot (meter)
--------------	--	-------------------------

E. Spillways, Drains and Velocity Dissipators

Item No. 441	Concrete spillway type___	Per each
Item No. 441	Concrete slope drain	Per square yard (meter)
Item No. 441	Velocity dissipators	Per square yard (meter)

Item No. 441	Concrete headwalls	Per cubic yard (meter)
--------------	--------------------	------------------------

G. Driveway Concrete

Item No. 441	Driveway concrete___ in (mm)thick	Per square yard (meter)
--------------	-----------------------------------	-------------------------

H. Curb Cut Wheelchair Ramps

Item No. 441	Curb cut wheelchair ramps, Type___	Per each
--------------	------------------------------------	----------

441.5.01 Adjustments

General Provisions 101 through 150.

Section 442—Roller Compacted Concrete Pavement

442.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 443—Elastomeric Profile Bridge Joint Seals

443.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 444—Sawed Joints in Existing Pavements

444.1 General Description

This work includes sawing joints in existing Portland cement concrete pavements such as roadway pavements, intersections, driveways, parking areas, and sidewalks when removing existing pavements is shown on the Plans or required by the Engineer.

General Provisions 101 through 150.

444.1.03 Submittals

General Provisions 101 through 150.

444.2 Materials

General Provisions 101 through 150.

444.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

444.3 Construction Requirements

444.3.01 Personnel

General Provisions 101 through 150.

444.3.02 Equipment

A. Mechanical Saw

Use an adequately powered, water-cooled, mechanical saw with a diamond-edge blade or an abrasive wheel that will cut a straight joint to the required depth.

The Engineer may require that a guide be used with the saw to produce a satisfactory joint.

444.3.03 Preparation

General Provisions 101 through 150.

444.3.04 Fabrication

General Provisions 101 through 150.

444.3.05 Construction

A. Joints

Saw joints true to the lines designated by the Engineer.

Saw the joints at least 2 in (50 mm) deep, or deeper if the Engineer directs, to remove pavement along true lines and to prevent spalling or overbreaking of pavement that will remain in place.

Saw with diamond blades. Do not dry saw with abrasive blades.

B. Removal of Pavement

After joints have been sawed to completely isolate a pavement to be removed:

1. Begin removing the pavement.
2. Protect the edges of the pavement that will remain. Do not use removal methods that may damage these edges.

C. Traffic Control

After removing the pavement, do not allow traffic or other equipment to cross the exposed edges of the remaining pavement until new pavement is constructed in its place.

444.3.06 Quality Acceptance

General Provisions 101 through 150.

444.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

444.4 Measurement

The length of sawed joints measured for payment is the actual linear feet (meters) of joints acceptably sawed.

444.4.01 Limits

General Provisions 101 through 150.

444.5 Payment

Sawed joints as described above will be paid for at the Contract Unit Price per linear foot (meter).

Payment will be made under:

Item No. 444	Sawed joints in existing pavements	Per linear foot (meter)
--------------	------------------------------------	-------------------------

444.5.01 Adjustments

General Provisions 101 through 150.

Section 445—Waterproofing Pavement Joints and Cracks

445.1 General Description

This work includes waterproofing joints and cracks in the pavement by cleaning the existing surface and placing a membrane over joints and random cracks as shown on the Plans.

445.1.01 Definitions

General Provisions 101 through 150.

445.3.01 Personnel

General Provisions 101 through 150.

445.3.02 Equipment

General Provisions 101 through 150.

445.3.03 Preparation

A. Bituminous Tack Coat

Place bituminous tack coat on:

- Portland cement concrete
- Old asphaltic concrete surfaces

The Engineer will determine when to place bituminous tack coat on new asphaltic concrete surfaces. When self adhesive waterproofing fabric is applied on existing surfaces, a bituminous application will not be necessary.

Before placing the membrane:

1. Prime the surface according to the manufacturer's recommendations.
2. Correct spalls greater than 3 in. (75 mm) in diameter that will prevent the material from bonding to the pavement or that will leave a cavity under the material.

Repair spalls using asphaltic concrete that meets the requirements of Section 400 or other materials such as cold mixes approved by the Engineer.

3. Place the primer on the surface at the rate specified by the primer manufacturer. Extend it 1 in (25 mm) wider than the membrane. Before applying the membrane, allow the primer to dry until it is tack-free.
4. Cover the sections that are primed with membrane within the same day or repriming will be required.

445.3.04 Fabrication

General Provisions 101 through 150.

445.3.05 Construction

A. Placing the Membrane

Place the membrane on joints and cracks over concrete pavements on interstate mainline and ramps and designated state routes that will be surfaced with asphaltic concrete, unless otherwise noted on the Plans.

1. Place the membrane only when the temperature is above 40 °F (4 °C) and the pavement surfaces are dry and free of dirt or debris.
2. Install the membrane in widths of at least 11-3/8 in (290 mm) and center them over the joint or crack within a 2 in (50 mm) tolerance.
3. Seal joints as follows:
 - a. Seal transverse joints and cracks first, starting at the outside edge of the pavement and extending the full length of the joints.
 - b. Seal the longitudinal joint(s) after the transverse joints, placing the membrane in the direction that the Project will be paved.

If laps are needed, place them in the transverse and longitudinal membranes with an overlap of at least 2.5 in (65 mm).

Section 445-Waterproofing Pavement Joints and Cracks

4. Install the membrane straight and wrinkle-free with no curled or uplifted edges. Slit and fold down wrinkles over 3/8 in (10 mm) wide.
5. Press the membrane against the concrete or asphalt surface using a hand roller or other equipment to ensure proper bonding.
6. Bond the edges and corners of the strips securely to the surface. Before placing the overlay, rebond or replace strips that have loose edges or corners at no expense to the Department.
7. Place the asphaltic concrete overlay when the membrane surface is dry.
8. Traffic will be allowed to enter the section between the time of placing the membrane and placing the paving, for a maximum of 7 calendar days. Before paving, replace damaged or disbonded membrane at no additional cost to the Department.
9. Fill joints or cracks flush with the pavement if they are wider than 0.5 in (13 mm) or deeper than 3/8 in (10 mm) and not adequately filled to provide support for the membrane over the joint. Use PG 64-22 asphalt cement, hot pour, or other approved sealant material before placing the membrane as directed by the Engineer.
10. Clean the joint to remove dirt and debris before filling the joint. Comply with the short-term pavement marking requirements of Section 150.

445.3.06 Quality Acceptance

General Provisions 101 through 150.

445.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

445.4 Measurement

The membrane quantity, complete in place and accepted, is measured in linear feet (meters). The length for transverse joints waterproofed is based on the typical cross section in the Plans, except that, where widening occurs for extra lanes, field measurements are made to determine the exact length waterproofed.

The length for longitudinal joints and random cracks waterproofed are measured in place along the center line of the joint on the surface of the pavement. No allowance is made for laps.

445.4.01 Limits

General Provisions 101 through 150.

445.5 Payment

Payment will be made at the Contract Unit Price per linear foot (meter) of joint and crack waterproofed, which will include cleaning the surface and furnishing and placing the primer and membrane.

Payment will be made under:

Item No. 445	Waterproofing pavement joints and cracks (<u>width</u>)	Per linear foot (meter)
--------------	---	-------------------------

445.5.01 Adjustments

General Provisions 101 through 150.

Section 446—Placement of Pavement Reinforcement Fabric

446.1 General Description

This work includes installing Type II pavement reinforcement fabric and high strength pavement reinforcement fabric over cracks, joints, and patches in existing asphaltic concrete pavement. Install the fabric in strips or full width before placing an overlay where shown on the Plans or as directed by the Engineer. Install high strength pavement reinforcement fabric on asphaltic concrete interstate projects.

446.1.01 Definitions

General Provisions 101 through 150.

446.1.02 Related References

B. Referenced Documents

General Provisions 101 through 150.

446.1.03 Submittals

General Provisions 101 through 150.

446.2 Materials

Use the reinforcement fabric that meets the requirements of Subsection 881.2.06.

Bituminous binder materials, when required, shall meet the requirements of Section 413, “Bituminous Tack Coat”.

446.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

446.3 Construction Requirements

446.3.01 Personnel

General Provisions 101 through 150.

446.3.02 Equipment

A. Template

When using fabric strips, use a template or other method satisfactory to the Engineer to apply the bituminous tack coat uniformly.

B. Mechanical Device

Use a mechanical device approved by the Engineer when placing the fabric full width on the pavement to ensure the fabric is placed smooth, free of wrinkles, and with no uplifted edges.

C. Roller

Place the fabric in total contact with the underlying pavement. Roll the fabric with a static drum or pneumatic roller to ensure adequate adhesion to the pavement surface.

446.3.03 Preparation

Before an existing pavement surface is milled, mark the location of joints and cracks with an offset reference so that they can be located after milling has been completed.

A. Cleaning the Pavement

Immediately before applying the bituminous tack coat, clean the pavement surface to remove rocks, dirt, debris, and other materials that may prevent a clean bonding surface.

B. Repairing Potholes, Spalls, or Cracks

Before placing the fabric, repair potholes, spalls, or cracks greater than 3/16 in (5 mm) wide. Repair spalls and potholes using asphaltic concrete that meets the requirements of Section 400 or other materials such as cold mixes approved by the Engineer.

Fill cracks with PG 64-22 asphalt cement or other materials approved by the Engineer.

446.3.04 Fabrication

General Provisions 101 through 150.

446.3.05 Construction

Do not install reinforcement fabric when ambient temperatures are less than 45 °F (7 °C).

Use a bituminous tack coat when temperatures are between 45°F (7 °C) and 70°F (21°C) for all reinforcement fabric types.

When ambient temperatures are a minimum of 70 °F (21 °C) and rising, reinforcement fabric with a self-adhesive backing may be installed at the Contractor's option without applying a bituminous tack coat except when the fabric is placed on a milled surface.

Use a bituminous tack coat when fabric is placed on a milled surface regardless of the temperature.

A. Applying Bituminous Binder

Use a bituminous tack coat to bond self-adhesive fabric to the pavement and apply the bituminous tack coat at a rate of 0.10 gal/yd² (0.45 L/m²) over non-milled surfaces and 0.20 gal/yd² (0.90 L/m²) over milled surfaces. Heat the bituminous tack coat and apply within a temperature range of 350 °F to 375 °F (175 °C to 190 °C).

Use bituminous tack coat to bond non-self-adhesive fabric to the pavement and apply at a rate of 0.10 gal/yd² (0.45 L/m²) over non-milled surfaces and 0.25 gal/yd² (1.13 L/m²) over milled surfaces. Heat the bituminous tack coat and apply within a temperature range of 350 °F to 375 °F (175 °C to 190 °C).

Where using fabric strips, use a template or other method satisfactory to the Engineer to apply bituminous tack coat uniformly.

Do not allow the width of the bituminous tack coat applied to exceed the width of the fabric by more than 1 in (25 mm) on each side.

B. Placing the Fabric

For self-adhesive reinforcement fabric, remove the release liner of the fabric and place the adhesive side to the pavement. Place self-adhesive reinforcement fabric no more than 24 hours in advance of the paving operation to ensure proper adhesion of the fabric to the pavement.

Section 446-Placement of Pavement Reinforcement Fabric

Place non-self-adhesive reinforcement fabric at least 1 hour but no more than 24 hours in advance of the paving operation to ensure proper adhesion of the fabric to the pavement. Place fabric on the pavement immediately after the bituminous tack coat has been applied to the pavement. Place the non-woven polyester side of the fabric on the pavement.

Install the fabric so that it is smooth, free of wrinkles with no uplifted edges. Provide a minimum of 5 in (125 mm) overlap on all sides of the repair area. Center the material over the repair area within a 2 in (50 mm) tolerance. When placed full width, use a mechanical device approved by the engineer to place the fabric on the pavement.

Immediately after the fabric is placed on the pavement, ensure that the fabric is in total contact with the underlying pavement. Roll the material with a static drum or pneumatic roller to ensure adequate adhesion to the pavement surface.

Any fabric with loose edges, corners or other improperly bonded areas shall be replaced at the expense of the Contractor prior to placement of the overlay or opening the fabric section to traffic.

C. Overlapping Fabric

If more than one strip of fabric is required to cover the repair area, the seams that are created shall be butt or lapped seams. When waterproofing is required, use lap seams with a minimum 2 in (50 mm) overlap. Make all lapped seams in the direction of the paving operation to prevent pickup by the paving train. The width of the fabric strips shall be shown on the plans.

Make joint overlaps to prevent pickup by the paving train that places the asphaltic concrete.

D. Protecting Fabric

When full width fabric is used, schedule work so that the fabric will be covered with asphaltic concrete prior to reopening the section to traffic. Do not allow traffic, other than necessary construction equipment or emergency vehicles, on unprotected fabric. If approved by the Engineer, traffic will be allowed to use a section with applied fabric strips for a maximum of 7 days. Coordinate all activities to conform to this restriction. Replace any damaged fabric prior to paving at the Contractor's expense. When short-term pavement markings are required, the markings shall meet the requirements of Section 150.

When in-place fabric is exposed to moisture prior to application of the overlay, make sure the fabric is completely dry before the overlay is placed.

If the fabric sticks to tires of trucks or paving equipment during the construction overlays, hot mix asphalt may be broadcast over the fabric for protection.

E. Placing Overlay

Use an asphaltic concrete overlay that meets the requirements of Section 400.

Prior to placement of the overlay, apply a bituminous tack coat over the fabric at a rate determined by the Engineer as described in Subsection 400.3.03.A.3.

The minimum thickness of asphaltic concrete over the strip shall be 2 in (50 mm). Milling may be required to provide the minimum thickness.

When using a vibratory roller for compaction, avoid the use of excessive amplitude. The use of excessive amplitude during the compaction process may result in an undesirable riding surface.

446.3.06 Quality Acceptance

General Provisions 101 through 150.

446.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

446.4 Measurement

The reinforcement fabric complete, in place, and accepted is measured by the square yard (meter) for full-width fabric, or by the linear foot (meter) for fabric strips. No allowance will be made for laps.

Section 446-Placement of Pavement Reinforcement Fabric

446.4.01 Limits

General Provisions 101 through 150.

446.5 Payment

Payment will be made at the Contract Unit Price per square yard (meter) or per linear foot (meter) of reinforcement fabric as shown in Subsection 446.4, "Measurement."

Payment is full compensation for the work specified in this section, including cleaning the surface and furnishing and placing the pavement reinforcement fabric.

Payment for Pavement Reinforcing Fabric Strips also includes all milling required to place the fabric according to the plans.

Payment will be made under:

Item No. 446	Pavement Reinforcement Fabric Strips, Type II, 18 inch (450 mm) Width	Per linear foot (meter)
Item No. 446	Pavement Reinforcement Fabric Full Width, Type II	Per square yard (meter)
Item No. 446	High Strength Pavement Reinforcement Fabric, 18 inch (450 mm) Width	Per linear foot (meter)

446.5.01 Adjustments

General Provisions 101 through 150.

Section 447—Modular Expansion Joints

447.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 448—Portland Cement Concrete End Dams and Patches

448.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 449—Bridge Deck Joint Seals

449.1 General Description

This work consists of furnishing and installing bridge deck joint sealing systems at the locations shown on the Plans.

These bridge deck joint sealing systems consist of a joint seal and may include concrete headers. Use a joint seal material that conforms to one of the following:

- A preformed elastomeric neoprene profile seal, or
- A low-density, closed cell, cross-linked, ethylene vinyl acetate, polyethylene copolymer, nitrogen-blown seal.

Use either epoxy concrete or elastomeric concrete for header material. Mix and use elastomeric and epoxy concrete material according to the manufacturer's guidelines.

449.1.01 Definitions

General Provisions 101 through 150.

449.1.03 Submittals

A. Working Drawings

Furnish working drawings covering the proposed joint installation. Before the joint is installed, the Bridge Engineer will review these drawings and indicate this review on the drawings.

The Department is not responsible for the accuracy of the drawings.

Assume responsibility for conforming to the Specifications and Plans. Include these items in the submission:

- Manufacturer's brochure on the proposed joint, showing component physical dimensions, installation procedures, material certifications, and a table of variable temperatures and dimensions
- Drawings that detail the joint installation and indicates the length of component members, treatment of directional changes, and field splicing of steel locking rails
- Expansion joint fabricator documentation

Ensure that the expansion joint fabricator is AISC Category I, shop approved. Supply documentation with the shop drawings.

B. Submissions for Preformed Elastomeric Neoprene Profile Seals

Furnish the manufacturer of the performed elastomeric neoprene profile seal a working drawing for each installation. This drawing shall include all of the following information:

- Identification and orientation of each joint
- Length of each joint including a minimum 6 in (150 mm) turn up at both barrier faces
- Total projected movement range of the joint
- Use a full-length seal if a full bridge width installation can be made. If traffic conditions require that the joint seal installation be in stages, indicate the splice points

In addition to the above, if existing edge beams are to remain as joint headers, furnish the manufacturer of the seal the following:

- Joint width measurements taken at 2 ft (600 mm) intervals along the full length of the joint plus a measurement of the joint width of each barrier in the area of the turn ups
- Ambient temperature, taken when width measurements are made

Have the manufacturer of the preformed elastomeric neoprene profile seal use this information to determine quantities of materials needed and the profile size or sizes for each joint.

Have the manufacturer enter this data on the working drawing, and verify that the data is accurate and submit a copy to the Engineer for review. Show an indication of such verification on the drawings.

Engineer approval is required before installing the joint seal. The Department review will be considered a service to assist the Contractor. The Department will assume no responsibility for the accuracy of the drawings, and the Contractor will not be relieved of any responsibility for conforming to the Specifications and Plans.

449.2 Materials

A. Elastomeric Concrete Material

Elastomeric concrete material includes two-component elastomer and prebagged fillers. Mix the elastomeric concrete material and use it according to the manufacturer's recommendations. This may require using heat to accelerate curing and ensure a quality bond to the concrete and steel.

Use the Elastomeric Concrete Material with these features:

- Compatible with the concrete and steel to which it is bonded
- Smooth riding surface across the joint
- Can be mixed using normal equipment

Can be mixed and placed between 45 °F to 100 °F (7 °C to 38 °C) B. Joint Sealing System

Use a joint sealing system designed for HS 20 truck loading and impact according to AASHTO design parameters. Ensure that the system can accommodate the movements indicated in the Plans.

C. Preformed Elastomeric Neoprene Profile Seal

The preformed elastomeric neoprene profile seal shall as a minimum:

- Have the capability to be evacuated of air during installation
- Have the capability to be pressurized with air during the adhesive curing time
- Be compatible with the epoxy and elastomeric concrete header materials (if required)
- Be designed to withstand 50% expansion, 50% contraction (total 100%)
- Withstand the effects of vertical and lateral movements, skew movement and rotational movement without adhesive or cohesive failure.

Ensure the preformed elastomeric neoprene profile meets the requirements of ASTM D 2628.

Ensure the adhesive used with the preformed elastomeric neoprene profile seals is a two-component epoxy based thixotropic paste meeting the seal manufacturer's requirements.

D. Low-Density, Closed Cell, Cross-Linked, Ethylene Vinyl Acetate, Polyethylene Copolymer, Nitrogen-Blown Seal

The low-density, closed cell, cross-linked, ethylene vinyl acetate, polyethylene copolymer, nitrogen-blown seal shall as a minimum be:

- Held in place by a two-component, 100% solid, modified epoxy adhesive.
- Compatible with the epoxy and header materials.

- Preformed, resistant to abrasion, oxidation, oils, gasoline, salt, and other materials that may be spilled on or applied to the surface.
- Grooved, with the grooves approximately 1/8 in. (3 mm) wide by 1/8 in. (3 mm) deep and spaced between 1/4 in. to 1/2 in. (6 mm to 13 mm) apart, and run along the entire length of the bond surface side of the seal.
- Designed so that, when compressed to 50% of original width, the center portion of the top will not extend upward above the original height of the seal by more than 1/4 in. (6 mm).
- Recessed below the riding surface throughout the normal limits of joint movement.
- Resistant to ultra violet rays.
- Beige or gray color.
- Shop marked to indicate the top or bottom side of the seal in such a way as to be clearly visible during installation.

Ensure the low-density, closed cell, cross-linked, ethylene vinyl acetate, polyethylene copolymer, nitrogen-blown seal has a working range of 30% tension and 60% compression.

Ensure the seal meets the following physical properties:

Test	Requirements	Test Method
Tensile Strength	50 psi (345 kPa)	ASTM D3575 (Suffix T)
Elongation at break	255% min.	ASTM D3575 (Suffix T)
Weather/Deterioration	No deterioration for at least 8 years	AASHTO T42 (Accelerated Weathering)
Compression/Deflection	10 psi (69 kPa) min., 60 psi (414 kPa) max. @ 50% deflection of original width	ASTM D3575 (Suffix B)
Tear Strength	13 psi (90 kPa)	ASTM D624
Density	2.8 to 3.4 pcf (45 to 54 kg/m ³)	ASTM D545

The adhesive used with the low-density, closed cell, cross-linked, ethylene vinyl acetate, polyethylene copolymer, nitrogen-blown seals shall be a two-component, 100% solid, modified epoxy adhesive meeting the requirements of ASTM C881, Type I, Grade 2, Class B & C.

The adhesive shall also have the following physical properties:

Tensile Strength	3500 psi (24 MPa) min.
Compressive Strength	7000 psi (48 MPa) min.
Shore D Hardness	75 psi (0.5 MPa) min.
Water Absorption	0.25% by weight

For applications on moist or hard to dry concrete surfaces, the adhesive shall be as specified by the joint material manufacturer.

E. Epoxy Concrete Material

Ensure the epoxy concrete material is as a minimum:

- Compatible with all allowable joint seal materials, and concrete or steel to which it is bonded.
- Capable of providing a smooth riding surface across the joint.
- Capable of being mixed using normal equipment.
- Capable of being mixed and placed at temperatures of 55 °F (13 °C) and above.

Use header material that is a two-component rapid curing epoxy with aggregate that cures to a dense semi-flexible, weather, abrasion, and impact-resistant epoxy concrete.

Ensure the material has the following physical properties:

Test	Requirements	Test Method
Mixed Epoxy without Aggregate: (Before and after oven aging at 158° F (70° C) for 72 hours)		
Tensile Strength (min.)	900 psi (6.2 MPa)	ASTM D 638
Elongation at Break (min.)	40%	ASTM D 638
Shore "D" Hardness	45-75	ASTM D2240
Pot Life (max.)	45 minutes	GDT 111
Mixed Epoxy with Aggregate:		
Compressive Strength at 24 hours (min.)	2,500 psi (17.2 MPa)	ASTM C-39 (3" cylinders)
Resilience at 5% Deflection (min.)	75%	GDT 111
Bond Strength to Concrete (min.*)	375 psi (2.6 MPa)	GDT 111
Wet Bond Strength to Concrete (min.*)	250 psi (1.7 MPa)	GDT 111
Thermal Compatibility	No Delamination	ASTM C 884
*Minimum psi or concrete failure.		

Have the manufacturer furnish the aggregate used in epoxy concrete. Use well-graded, clean and dry aggregate meeting the following gradation requirement:

Size	Percent Passing by Weight
No. 4 Sieve	100
No. 80 Sieve	0-5

Note: Test according to AASHTO T 27.

F. Elastomeric Concrete Material

Ensure the elastomeric concrete material is as a minimum:

- Compatible with all allowable joint seal materials and concrete or steel to which it is bonded.
- Provides a smooth riding surface across the joint.
- Capable of being mixed using normal equipment.
- Capable of being mixed and placed between 45 °F and 100 °F (7 °C and 38 °C).

G. Elastomeric Concrete Cured Binder Material

Ensure elastomeric concrete cured binder material (without filler) has the following physical properties:

Test	Requirements	Test Method
Before oven aging:		
Tensile strength (min.)	750 psi (5.2 MPa)	ASTM D 638
Elongation at break	200 – 350%	ASTM D 638
Hardness Type D durometer	38, ± 8	ASTM D 2240
Compression set, 22 hrs at (max.) 158° F (70° C)	50%	ASTM D 395 Method B
Tear resistance (min.)	150 lbs/in (2.7 kg/mm)	ASTM D 624—2 in/min (50 mm/min)
Water absorption (max.)	1.2%	ASTM D 570
Heat shrinkage (max.)	1.6%	ASTM D 1299
Impact strength (min.)	7 ft-lbs/min (9.5 N ·m)	GDT 111
Properties after oven aging at 158° F (70° C) for 72 hrs:		
Tensile strength (min.)	750 psi (5.2 MPa)	ASTM D 638
Elongation at break	150 – 350%	ASTM D 638
Hardness Type D durometer	42, ± 5	ASTM D 2240
Impact strength (min.)	7 ft-lbs/min (9.5 N ·m)	GDT 111

H. Elastomeric Concrete Binder Material

Ensure that the elastomeric concrete binder material (with filler) has the following physical requirements:

Test	Requirements	Test Method
Resilience at 5% deflection (min.)	80%	GDT 111
Bond strength to concrete (min.*)	375 psi (2.6 MPa)	GDT 111
Wet bond strength to concrete (min.*)	250 psi (1.7 MPa)	GDT 111
Pot life (min.)	5 minutes	GDT 111
*Minimum psi (MPa) or concrete failure		

I. Temporary Joint Filler

Use temporary joint filler when epoxy concrete material is used. The temporary joint filler shall be an extruded rigid cellular polystyrene with enough compressive strength to maintain the correct joint width and to obtain relatively smooth and straight faces upon removal of the material.

449.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

449.3 Construction Requirements

449.3.01 Personnel

General Provisions 101 through 150.

449.3.02 Equipment

General Provisions 101 through 150.

449.3.03 Preparation

A. Surface Preparation

Ensure that the compressed air used to sandblast and/or blow debris is free of moisture and oil. Use air compressors for cleaning joints that are equipped with suitable traps capable of removing surplus water and oil in the compressed air. Check the compressed air daily for contamination. Do not use contaminated air. Use a compressor that can deliver compressed air at a continuous pressure of at least 90 psi (620 kPa)..

1. Preparation for Headers:

Remove loose, eroded, and unsound concrete from the surface within the joint area. Provide horizontal bonding areas by cutting all angular areas of concrete blockouts. Immediately before placing the epoxy or elastomeric concrete, sandblast the concrete surfaces or abrade free of oil, dust, dirt, traces of asphaltic concrete, or other contaminants.

2. Preparation for Joint Seal:

Remove loose, eroded, and unsound concrete from the surface within the joint area. Immediately before placing the seal, sandblast the concrete surfaces or abrade free of oil, dust, dirt, traces of asphaltic concrete, or other contaminants. Saw-cutting of the concrete deck maybe necessary to provide an acceptable attachment surface for the joint seal.

449.3.04 Fabrication

A. Joint Fabrication

Have the joint fabricated full width of the bridge deck, except in stage construction (one lane at a time) or when joint length prohibits shipment.

449.3.05 Construction

Use an installer trained by the manufacturer to install the bridge deck joint sealing system. A manufacturer's representative shall be present during the installation of the epoxy or elastomeric concrete headers. Install the joint system according to the manufacturer's recommendations and the following:

A. Blockouts

Blockouts shall be according to the Plan details.

B. Weather Limitations

Do not perform any part of the installation in rainy weather or when rain is expected within one hour of installation.

Ensure the surface is completely dry before applying adhesive or primer.

The ambient temperature must not be less than 55 °F (13 °C) during installation of the epoxy concrete material and preformed elastomeric neoprene profile seal.

Ensure the ambient temperature is between 45 °F (7 °C) and 100 °F (38 °C) while installing the elastomeric concrete material.

Ensure the ambient and surface temperatures are between 45 °F (7 °C) and 75 °F (24 °C) while installing the low-density, closed cell, cross-linked, ethylene vinyl acetate, polyethylene copolymer, nitrogen blown seal.

C. General Safety, Handling, Mixing, Finishing, and Curing

Handle, place, finish, and cure elastomeric concrete joint systems according to the manufacturer's instructions and the following:

1. Fill the blockout, as shown in the Plans, to the correct grade.
2. After filling the blockouts on both sides cure the material according to the manufacturer's instructions.

Mix and place the epoxy mortar according to the manufacturer's recommendations and the following:

1. Before adding the aggregate, thoroughly mix the two components (resin and hardener) of the epoxy mortar.
2. Mix the epoxy mortar in a mechanical mortar mixer by combining one volume of mixed epoxy (resin plus hardener in the required proportions) with three volumes of aggregate meeting the requirements of this Specification.
3. Prime the surface of the concrete in accordance with the manufacture's recommendations before applying the epoxy concrete.
4. Place and finish the epoxy concrete within one half hour of mixing.

The cure time of epoxy mortar is directly related to temperature. Use the following table as a general guideline for cure time at various temperatures.

Air and Deck Temperature °F (°C)	Approximate Cure Time (hours)
40 (4)	5
50(10)	4
60(16)	3
70(21)	2.5
80(27)	1.5
90(32)	1
100(38)	0.75

Postpone the installation process if the ambient temperature is not 55 °F (13 °C) and rising. If you cannot postpone the operation, use supplemental heat to complete the operation and reopen the lane in a reasonable time. If using supplemental heat, ensure that the cure has progressed throughout the mass of the header.

D. Mixing and Placing Elastomeric Concrete Material

Handle, place, finish, and cure the elastomeric concrete material according to the manufacturer's instructions. Allow the elastomeric concrete to cool and solidify for at least one hour before opening to traffic.

E. Preformed Elastomeric Neoprene Profile Joint Seal Application

1. After the epoxy or elastomeric concrete has developed enough strength to be traffic ready, remove the temporary joint filler (when called for) and thoroughly clean the joint faces of all joint filler.
2. Lightly sandblast the joint to remove all residue.
3. Apply the adhesive according to the manufacturer's recommendations.
4. Install the preformed elastomeric neoprene profile seal so that it is recessed approximately 1/4 inch (6 mm) below the riding surface.
5. After a joint has been sealed, promptly remove all surplus residue on the bridge deck.

F. Low-Density, Closed Cell, Cross-Linked, Ethylene Vinyl Acetate, Polyethylene Copolymer, Nitrogen-Blown Seal Application

1. After the epoxy or elastomeric concrete (if required) has developed enough strength to be traffic ready, remove the temporary joint filler (when called for) and thoroughly clean the joint faces of all joint filler.
2. Lightly sandblast the joint to remove all residue.
3. Apply the epoxy adhesive to both sides of the joint opening and into the grooves of the joint seal material.
4. Splice the seal using the heat welding method by placing the joint seal material ends against a Teflon heating iron of 350 °F (177 °C) for 7-10 seconds and pressing the ends together tightly.

5. Install the joint seal material in one piece.
6. Begin installation at the low end of the joint. Install the joint seal material by compressing the material and pushing it down into the joint opening until it has recessed approximately 1/4 inch (6 mm) below the deck surface. Do not push the joint seal material into the joint at an angle that will stretch the seal material.
7. Once installation of the joint seal material has begun, do not stop the process until it has been completed.
8. Immediately and thoroughly clean off excess epoxy from the surface of the joint material. Do not use solvents to clean the top surface of the joint seal material

G. Opening to Traffic

Do not permit traffic to drive over sealed joints until the epoxy or elastomeric concrete has hardened enough to resist displacement of the seal due to deck movement or other causes. Allow the elastomeric concrete to cool and solidify for at least one hour before opening to traffic. Allow the epoxy concrete to cure for at least two hours before opening to traffic.

449.3.06 Quality Acceptance

A. Acceptance

Provide evidence from the manufacture that the joint system has been used successfully in installations with similar environmental and project conditions. Failure to perform adequately in actual use shall be cause for rejection.

B. Correction of Defects

At the Contractor's expense, repair, or remove and replace, joint seals that are complete and have leaks, have adhesive or cohesive failure, or that are damaged during construction or by traffic before final acceptance.

449.3.07 Contractor Warranty and Maintenance

To comply with Subsection 106.05, "Materials Certification," provide certification from the manufacturer that shows that the bridge deck joint sealing system materials conform to the requirements stated in Subsection 449.2. Transfer to the Department the manufacturer's standard five-year performance warranty on each installation. A warranty claim may be filed for cohesive or adhesive failure of the materials supplied or material failure due to weathering.

449.4 Measurement

When listed as a pay item in the Proposal, bridge deck joint seal will be measured and paid for at the Contract price linear foot (meter) complete in-place joint at the location specified on the Plans. Payment is full compensation for the removal of any old sealant, cleaning the joint, and furnishing and installing the new seal and header if required and all incidentals.

No separate measurement and payment will be made unless a pay item for the work is included in the Proposal. If no pay item is included in the Proposal, the cost of the joint seal shall be included in the overall bid price submitted.

No separate measurement or payment will be made for any saw-cutting required to install the joint.

449.4.01 Limits

General Provisions 101 through 150.

449.5 Payment

When shown in the schedule of Items in the Proposal, the following items will be paid for separately:

Section 449-Bridge Deck Joint Seals

Item No. 449	Performed Elastomeric Neoprene Profile Joint Seal with Epoxy Concrete Headers Bridge No. _____ Bent No. _____	Per linear foot (meter)
Item No. 449	Performed Elastomeric Neoprene Profile Joint Seal with Elastomeric Concrete Headers Bridge No. _____ Bent No. _____	Per linear foot (meter)
Item No. 449	Low-Density, Closed Cell, Cross-linked, Ethylene Vinyl Acetate, Polyethylene Copolymer, Nitrogen-Blown Seal with Epoxy Concrete Headers Bridge No. _____ Bent No. _____	Per linear foot (meter)
Item No. 449	Low-Density, Closed Cell, Cross-linked, Ethylene Vinyl Acetate, Polyethylene Copolymer, Nitrogen-Blown Seal with Elastomeric Concrete Headers Bridge No. _____ Bent No. _____	Per linear foot (meter)
Item No. 449	Low-Density, Closed Cell, Cross-linked, Ethylene Vinyl Acetate, Polyethylene Copolymer, Nitrogen-Blown Seal Bridge No. _____ Bent No. _____	Per linear foot (meter)
Item No. 449	Elastomeric Profile Bridge Joint Seals, Bridge No. _____ Bent No. _____	Per linear foot (meter)

449.5.01 Adjustments

General Provisions 101 through 150.

Section 450—Pressure Grouting Portland Cement Concrete Pavement

450.1 General Description

This work includes pumping a slurry type grout mixture through holes drilled in the pavement into voids underneath the slabs to stabilize and underseal Portland cement concrete pavement.

Use a grout mixture that can form a hard and durable mass to fill voids under the pavement. Regrout unstable slabs after initial undersealing and stabilizing as directed by the Engineer.

450.1.01 Definitions

Initial set: 200 psi (1380 kPa) with a 0.25 in² (161 mm²) probe according to AASHTO T 197 (Proctor Needle Test).

450.1.02 Related References

Section 450-Pressure Grouting Portland Cement Concrete Pavement

AASHTO T 197 (Proctor Needle Test)

450.1.03 Submittals

General Provisions 101 through 150.

450.2 Materials

A. Fine Aggregate

Ensure that fine aggregate meets the requirements of Subsection 801.2.02, except mortar-making properties are not required.

B. Grout Mixtures

The Bid Item designates the required undersealing grout mixture types. The mixture contains the proportions listed in the Table of Grout Mixtures below.

Use enough mixing water with the dry ingredients to produce a grout consistency that makes the efflux time from the flow cone at least 14 seconds and no more than 20 seconds. Use GDT 84 to determine the grout consistency.

Add cement, cement and limestone dust, cement and fly ash, or cement and fine aggregate in the proper proportions to a mixed batch to produce the required consistency.

Table of Grout Mixtures					
Mix Proportions, Percent by Weight of Dry Materials					
Grout Types Dry materials	1	2	3	4	5
Cement (min.)	25	25	25	25	25
Limestone dust	—	25	75	50	—
Fly ash	25	—	—	25	75
Fine aggregate	50	50	—	—	—

Ensure that materials meet the requirements of these Specifications:

Material	Section
Portland Cement Types I or III	Section 830
Mineral Filler (Limestone Dust)	Section 883
Calcium Chloride, Type I	Section 884**
Fly Ash, Type F	Section 831
Water	Section 880
Fine Aggregate Size No. 20	Subsection 801.2.02
Agricultural Lime	Subsection 882.2.02*
*Agricultural lime used for undersealing shall have at least 95% passing the No. 30 (600 µm) sieve and 30% passing the No. 200 (75 µm) sieve.	
**The Laboratory may approve other commercially available accelerators that may be substituted for calcium chloride.	

450.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

450.3 Construction Requirements

450.3.01 Personnel

Provide personnel to control the lifting on every slab that is undersealed.

Furnish a truck driver and sufficient workers to assist operating static load measuring gauges on the slab stabilization testing equipment.

450.3.02 Equipment

A. Batching Equipment

The batching equipment includes weight hoppers and scales for each dry material or calibrated volumetric batch hoppers.

Calibrate volumetric batch hoppers in increments equivalent to one 94 lb (42.6 kg) bag of cement. Use aggregate scales accurate to ± 1 percent and cement scales accurate to plus or minus 0.5 percent.

Equip conveyor belts with windproof covers if the belts convey the dry materials into the mixer.

B. Mixing Equipment

For mix types one through four, use a watertight, batch-type mixer or high-speed colloidal mixer capable of blending the materials into a homogenous mixture. Use a high-speed colloidal mixer for mix type five.

C. Grout Pumping Equipment

Use grout pumping equipment with a positive displacement plunger or piston-type pump or a screw-type worm pump.

1. Ensure that the discharge line is equipped with the following:
 - Pressure gauge at the pump capable of measuring from 0 to 200 psi (0 to 1380 kPa)
 - Positive cut-off valve at the nozzle end
 - Bypass return line for recirculating the grout back into a holding tank or mixer
2. Equip the end of the discharge line with a nozzle or device that remains secure in the drilled holes and is free of leaks.
3. Furnish a blow pipe with enough air pressure to dislodge loose debris.
4. Provide an auger of the proper size and length to open clogged holes.

D. Drilling Equipment

Provide the following drilling equipment:

- Air compressors—Provide air compressors with enough capacity to operate pneumatic hammers or drills.
- Pneumatic or hydraulic drills—Provide pneumatic or hydraulic drills equipped with bits that will cut 1.5 in (38 mm) or other approved diameter holes through the concrete pavement.

Operate the equipment so as to prevent damage to the pavement being drilled. Do not create excessive down pressure to force the bit through the concrete rapidly. The Engineer must approve the drilling procedure.

E. Slab Stabilization Testing Equipment

Furnish a two axle truck with dual rear wheels. Load the rear axle to 18 kips (8000 kg) evenly distributed between the two sides.

F. Slab Lift Measuring Equipment

Ensure that equipment used to measure the slab lift can simultaneously detect movement of the two outside slab corners adjacent to a joint and the adjoining shoulder. Ensure that the equipment can make these measurements to 0.001 in (0.025 mm).

450.3.03 Preparation

General Provisions 101 through 150.

450.3.04 Fabrication

General Provisions 101 through 150.

450.3.05 Construction

A. Observing Weather Limitations

Begin pressure grouting operations when the air temperature in the shade and away from artificial heat is at least 35 °F (2 °C) and rising. Stop pressure grouting if the temperature is 40 °F (4 °C) and falling or when the subgrade contains an abnormal amount of moisture.

B. Testing

Slab testing is performed to detect all slabs having a deflection greater than 0.030 in (0.76 mm).

Perform testing between 3:00 AM and 9:00 AM, unless otherwise directed by the Engineer. In hot weather, test between 3:00 AM and 7:00 AM if directed by the Engineer. Stop testing if slabs are beginning to “lock-up.”

1. Preliminary Testing by the Department

Preliminary testing is not required on slabs that require grouting but have been previously tested and marked by the Department.

2. Preliminary Testing by the Contractor

If the Department has not performed preliminary testing, use static methods to test each transverse joint and crack on the Project or within designated Project areas.

Do not test, however, transverse cracks in slabs that are to be replaced entirely. Test the joints and cracks as follows:

- a. Furnish four gauges on two gauge mounts (two gauges per mount) that can detect slab movement under the load to the nearest 0.001 in (0.025 mm).
- b. Maintain the gauges and mounts in operating order. Furnish the loaded truck, truck operator, and personnel to place and assist in operating the gauges.
- c. Position one set of gauges with one gauge referenced to the corner of each slab on both sides of the joint near the pavement edge. Zero in the gauges with no load on the slab on either side of the joint.
- d. Move the test truck into position and stop it with the center of the test axle about 1 ft (300 mm) behind the joint and the outside test wheel approximately 1 ft (300 mm) from the pavement edge.
- e. Read the back gauge and move the test truck across the joint to about 1 ft (300 mm) forward of the joint. Read the forward gauge.
- f. Repeat this operation for each joint to be tested. The Inspector will read and record the gauges.
- g. When required, perform additional tests on slabs that move more than 0.030 in (0.76 mm) or as shown on the Plans. Perform additional tests as follows:
 - 1) Drill one hole in the corner of the slab where the movement was measured.
 - 2) Drill the holes the same diameter as the undersealing holes and place the holes 18 in (450 mm) from the transverse and shoulder joint.
 - 3) Fill the test holes with water and observe.
 - 4) If the Engineer believes the pavement system readily drains the water poured into the test hole, pressure grout the slab. Based on the results of testing, deflection measurements, and water drainage observations, the Engineer will determine which slabs require undersealing.
- h. After the designated slabs have been pressure grouted according to these Specifications, retest them according to Subsection 450.3.05.B.2, “Testing.”
- i. Regrout and retest slabs that deflect more than 0.030 in (0.76 mm) or deflect the amount shown on the Plans, as directed.

Section 450-Pressure Grouting Portland Cement Concrete Pavement

Slabs will be accepted that continue to show movement greater than specified after two properly performed groutings.

C. Drilling Holes

The Plans show the location of holes to be drilled in each type of slab for undersealing. However, whenever possible, use the holes from previous undersealing work by redrilling.

To begin drilling:

1. Use the hole pattern and pumping sequence shown on the Plans with modifications to use as many holes from previous undersealing work as possible.
The Engineer may alter the hole pattern. Only the actual number of holes drilled will be considered for payment for the initial undersealing.
2. Drill the holes 1.5 in (38 mm) diameter or another size if approved by the Engineer. Ensure that the holes provide positive seal for the pumping nozzle.
3. For the first undersealing, drill the holes to approximately 8 in (200 mm) deep beneath the bottom of the concrete unless the Engineer approves an alternate depth.
The Engineer shall designate the number, depth, and location of holes for undersealing attempts after the initial attempt.
4. Be careful during operations to not break or crack the slabs.
5. Repair slabs that have cracks that extend through the drill hole at the Contractor's expense. Make repairs according to Section 609 and Section 452.

D. Cleaning Holes

After drilling the holes, and immediately before pumping the underseal grout, insert a pipe with enough air pressure in each hole to remove debris and to provide a passage for the grout, if necessary.

E. Pumping Underseal Grout

Properly position the lift measuring device before pumping grout under a slab.

Fill the voids under a slab as follows:

1. Pump grout in holes designated by the Engineer.
2. Have the Engineer determine the time of day to perform pressure grouting. The Engineer may require pressure grouting during late night and early morning hours if the slabs cannot be stabilized with daytime grouting.
3. During pumping, watch the lift measuring device to prevent excessive pumping pressures, rapid lifting of slabs, or substantial rising of the adjacent shoulders.
4. Stop pumping in the hole when the cavities or voids are filled within the range of the hole being grouted. Grout flowing out of an adjacent hole or joint or the edge of the slab is sufficient evidence that the voids and cavities are filled and pumping should cease. Additional evidence is that the slab rises rapidly or the adjacent shoulder begins to rise.
 - a. Lift the slab slightly to move grout into the existing cavities and voids.
 - b. Do not lift more than 0.050 in (1.3 mm) for a slab measured at the outside joint corner unless approved by the Engineer.

NOTE: Do not crack the slabs by differential lifting.

5. Secure the discharge hose nozzle in the hole to provide a seal that will maintain the grout pressure underneath the slab.
Ensure that the nozzle end does not extend below the bottom of the concrete.
6. Continue pumping in a hole until a clear flow of grout comes out other holes, joints, or cracks, or until the slab begins to lift excessively.

Section 450-Pressure Grouting Portland Cement Concrete Pavement

7. Repeat this procedure in other holes until the voids are filled. Do not plug the holes during grouting operations.
8. When edge drains are near the shoulder or pavement interface, take precautions to minimize the amount of grout that flows into the edge drain system.
Use the following procedure or an alternate approved by the Engineer to monitor grout flow into the edge drain system:
 - a. Drill one or more “observation holes” in the asphaltic concrete shoulder as close as possible to the shoulder or pavement interface.
 - b. Time the grouting operation to prevent and stop excess grouting in a hole to ensure that grout does not flow into the edge drain system.
 - c. When grouting operations are complete, fill the “observation holes” with asphaltic concrete.
9. Prevent slabs from cracking during the undersealing operation. Remove and replace slabs cracked during this operation at the Contractor’s expense according to Section 609 and Section 452.

F. Cleaning Up

Before permitting traffic on the section, remove grout deposits on the pavement or shoulders and clean the surface. Remove debris, bags, spillage, etc., from the Right-of-Way each day.

G. Permanently Sealing Holes

Remove the grout from the holes and fill the holes with a stiff sand-cement mixture or an approved quick setting patching material.

Repair filled holes that ravel out or become damaged. Also, repair unsatisfactorily filled holes from previous undersealing work at the Contractor’s expense, as directed by the Engineer.

H. Testing for Slab Stability

After pumping the grout under the designated slab and permitting traffic over the slabs for at least 12 hours, test the slabs for stability.

Conduct these tests by static loading as in Subsection 450.3.05.B.2.h and Subsection 450.3.05.B.2.i. Based on the test results and criteria on the Plans, the slabs will be accepted or designated for further undersealing as directed by the Engineer.

I. Opening to Traffic

Do not permit traffic on the grouted slabs until the grout has taken an initial set (normally 4 to 6 hours).

Schedule the operations so that the grout has initially set and the work area is cleared before traffic is allowed on the grouted slabs.

450.3.06 Quality Acceptance

General Provisions 101 through 150.

450.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

450.4 Measurement

Portland cement incorporated into the pressure grout slurry is measured by the 94 lb (42.6 kg) bag.

A. Holes

On an initial undersealing attempt, holes drilled through the existing concrete slabs at the locations and to the depths shown on the Plans or directed by the Engineer are measured per each.

Section 450-Pressure Grouting Portland Cement Concrete Pavement

If holes drilled for the first stabilizing attempt are used for the second stabilizing attempt, holes are not paid for again by the Department. If new holes are drilled they are measured per each.

B. Preliminary Testing

Preliminary testing described in Subsection 450.3.05.B.2.h and Subsection 450.3.05.B.2.i. is measured by the linear mile (linear kilometer), horizontal measure for each lane of each roadway tested, when required. Bridges are not included in the measurement.

C. Stability Testing

Stability testing in Subsection 450.3.05.H is measured by the joint.

450.4.01 Limits

General Provisions 101 through 150.

450.5 Payment

A. Holes

Holes will be paid for at the Contract Unit Price per each. Payment is full compensation for drilling and sealing the hole.

If holes drilled for the first stabilizing attempt are used for the second stabilizing attempt, the Department does not pay for the holes again.

B. Portland Cement Pressure Grout Slurry

Portland cement pressure grout slurry will be paid for at the Contract Unit Price bid per 94 lb (42.6 kg) bag of cement or fraction thereof. Payment is full compensation for furnishing materials to be incorporated into the grout slurry, hauling, mixing, pumping, and cleaning to stabilize the slabs.

C. Preliminary Testing

Preliminary testing when shown on the Plans and in the Proposal as a payment Item will be paid for at the Contract Price bid per linear mile (kilometer), horizontal measure. Bridges will be excluded from the linear mile (kilometer) measurement.

D. Stability Testing

Static testing of slabs performed according to Subsection 450.3.05.B.2.h and Subsection 450.3.05.B.2.i. will be paid for each time the joint is tested. Payment is full compensation for furnishing the load test truck, driver, and personnel necessary to assist in the testing.

E. Pumping Under Seal Grout

No separate payment will be made for this work. Include the cost in the bid submitted for Portland cement pressure grout slurry. The precautions used will require prior approval of the Engineer.

Payment will be made under:

Item No. 450	Holes	Per each
Item No. 450	Portland cement pressure grout slurry (grout type____, ____, or____)	Per bag 94 lb (42.6 kg)
Item No. 450	Preliminary testing	Per linear mile (kilometer)
Item No. 450	Stability testing	Per joint

450.5.01 Adjustments

General Provisions 101 through 150.

Section 451—Patching Portland Cement Concrete Pavement (Spall Repair)

451.1 General Description

This work includes partial depth patching of spalls and potholes in Portland cement concrete pavement by removing the broken, damaged, or disintegrated concrete pavement. This work also includes removing asphaltic concrete patches from spalled or damaged areas of the pavement surfaces and patching them with approved patching materials according to this Specification and the existing pavement cross-sections.

451.1.01 Definitions

General Provisions 101 through 150.

451.1.02 Related References

A. Standard Specifications

Section 886—Epoxy Resin Adhesives

Section 934—Rapid Setting Patching Materials for Portland Cement Concrete

B. Referenced Documents

QPL 27

451.1.03 Submittals

General Provisions 101 through 150.

451.2 Materials

Ensure that the materials used to repair and patch Portland cement concrete pavement conform to the rapid setting patching material requirements.

The laboratory may waive the setting time requirements of approved materials if the minimum compressive strength development is unaffected.

451.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

451.3 Construction Requirements

451.3.01 Personnel

General Provisions 101 through 150.

451.3.02 Equipment

To clean the repair areas, use air compressors equipped with traps that can remove surplus water and oil in the compressed air. Ensure that the compressor can deliver compressed air at a continuous pressure of at least 90 psi (620 kPa).

The Engineer will check the compressed air daily for contamination. Do not use contaminated air.

451.3.03 Preparation

A. Removing and Preparing the Repair Area

Prepare to perform partial patching of spalled joints and potholes as follows:

1. Partial Depth Patching of Spalled Joints

- a. “Sound” each transverse joint and longitudinal joint with a visual defect to determine the limits of the damaged or defective areas. Strike the pavement surface along the sides of each joint with a hammer, chain drag, or similar tool to detect unsound concrete that sounds flat or hollow.
- b. Mark the limits of the defective areas on the pavement by making a rectangle 2 in (50 mm) beyond the outer limits of the unsound concrete area as a guide for sawing.
- c. Mark spalled areas less than 2 ft (600 mm) from each other along a joint as one spall area. If separated by 2 ft (600 mm) or more, mark as separate spall areas.

Do not repair defective (spalled) joint areas less than 6 in (150 mm) long and 1.5 in (40 mm) wide under this Specification. Thoroughly clean and seal them with silicone sealant as part of the joint sealing operation specified in Section 461.

- d. Saw the rectangular marked areas with near vertical faces at least 2 in (50 mm) but not more than 3 in (75 mm) deep.
- e. Remove unsound material within the sawed area with a maximum 30 lb (135 N) chipping hammer.
- f. Do not damage or fracture the sound concrete substrate to be left on the bottom of the spall area. Do not use sharp pointed bits.
- g. If the unsound material is more than 4 in (100 mm) deep, the Engineer may direct a 6 ft (1.8 m) slab replacement be placed, which is classified and paid for under Section 609 and Section 452.
- h. Before placing the patching material, saw the face of the existing transverse or longitudinal joints bordering the repair areas. Saw at least 5 in (125 mm) deep and 0.25 in (6 mm) wide with the full depth of the saw cut extending at least 1 in (25 mm) beyond the limits of the repair areas in each direction.
- i. Immediately before placing the patching material, thoroughly clean the surfaces within the repair areas by sandblasting and air blasting to remove oil, dust, dirt, traces of asphaltic concrete, slurry from saw operation, and other contaminants.
- j. Place a 0.25 in (6 mm) wide piece of closed cell polyethylene foam shaped to fit the saw cut in the joints bordering the repair areas.

If “back-to-back” repairs are made at a joint, support the 0.25 in (6 mm) closed-cell polyethylene foam during the placing operation to maintain a true, straight joint line.

Have the Engineer approve the method used. The polyethylene foam must be supported in a straight line when the patching material is placed so a straight joint line will be formed.

Maintain a straight line or the Engineer may require the repairs be repeated at no additional cost to the Department.

2. Partial Depth Patching of Pavement Potholes

The Engineer will determine which pavement potholes will be repaired.

Use the procedures given for repairing spalled joints to repair potholes within the pavement surface. The requirement of using the 0.25 in (6 mm) closed-cell polyethylene foam does not apply.

451.3.04 Fabrication

General Provisions 101 through 150.

451.3.05 Construction

A. Concrete Patching

Patch concrete one lane at a time, safely and rapidly to minimize inconvenience to the traveling public.

1. Accomplish the work with other operations in progress within an area if possible.
2. Complete the work before the grinding operation begins, if grinding is specified.
3. Remove and replace completed concrete patches that contain cracks, shrinkage, compression failures, or are damaged by construction or traffic before Final Acceptance at no additional cost to the Department.

B. Placing Patching Material

Use Repair Method 1 unless the State Materials Research Engineer gives written approval to use Repair Method 2. Use Repair Method 1 when the average daily temperature is 50 °F (10 °C) or above. Use of Repair Method 2, if approved, is limited to the manufacturer's written recommendations.

For the following repair methods, begin the placement when the surface within the repair area is dry and thoroughly free of contaminants.

Ensure that the finished surface including joints meets a surface tolerance of 1/8 in (3 mm) per 10 ft (3 m).

Use approved measures as necessary to keep pavement surfaces adjacent to this operation free of excess grout and other materials. Unless otherwise specified, complete the patching operations and open the lanes to traffic before sunset each day.

1. Repair Method 1: Twenty-four Hour Accelerated Strength Concrete

Use this method as follows:

- a. Completely coat the concrete surface areas within the repair area with a film of Type II epoxy approximately 10 to 20 mils (0.25 to 0.50 mm) thick.
 - b. Mix the concrete on site in a portable mixer. Obtain approval for the mix design and mixing method from the laboratory. The material must meet a slump range of 1.0 in. (25mm) to 3.0 in. (75mm).
 - c. Deposit the concrete in the repair area while the epoxy is still tacky. Vibrate it to form a dense, homogeneous mass of concrete that completely fills the patch area.
 - d. Screed the concrete to the proper grade and do not disturb it until the water sheen disappears from the surface.
 - e. Cover the concrete with wet burlap or membrane curing compound. Allow the curing to continue for at least three hours. The Engineer may require longer curing to ensure sufficient concrete strength development before opening to traffic.
2. Repair Method 2: Rapid Setting Patching Material for Portland Cement Concrete Pavement (Type I, II, IV, and V)
- a. In addition to the requirements outlined in Subsection 451.3.03.A, "Removing and Preparing the Repair Area," prepare the surfaces in the repair areas according to the manufacturer's written recommendations.
 - b. Perform the patching material handling, mixing, placing, consolidating, screeding, and curing according to the manufacturer's written instructions as approved by the laboratory.
 - c. Continue curing for at least one hour and until opening the section to traffic.

C. Special Requirements

The following special requirements apply to this work:

1. If repairing adjacent to an unstable shoulder, place a form the full depth of the repair area to maintain a true, straight shoulder joint and to prevent the patching material from intruding onto the shoulder area.
2. After curing the patching material, remove the form and repair the shoulder at no cost to the Department.

Section 451-Patching Portland Cement Concrete Pavement (Spall Repair)

3. During sandblasting, protect traffic in the adjacent lanes.
4. After the sandblasting operations:
 - a. Thoroughly clean the area to be repaired with compressed air.
 - b. Remove sand from the sandblasting operation from the roadway and shoulders.
5. Do not “over-cut” the pavement beyond marked areas whenever possible.
6. Remove saw slurry and other contaminants from the over-cutting.
7. Repair the over-cuts by filling full-depth with an approved low-viscosity epoxy compound using a Type II epoxy adhesive specified in Section 886. Make these repairs as soon as possible, but not after the joint is resealed.
8. Re-establish original transverse and longitudinal joints by sawing and sealing the joints with silicone that meets the requirements of Subsection 833.2.06, the Plan details, and Section 461.

Re-establish the joints within 60 days after placing the patch. Ensure that re-established joints are at least 3/8 in (10 mm) wide.

451.3.06 Quality Acceptance

General Provisions 101 through 150.

451.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

451.4 Measurement

The area measured for payment is the number of square yards (meters) of patching complete in place and accepted.

451.4.01 Limits

General Provisions 101 through 150.

451.5 Payment

The area measured as specified above will be paid for at the Contract Unit Price per square yard (meter). Payment is full compensation for equipment, tools, labor, incidentals to complete the work, including but not limited to:

- Removing existing asphaltic concrete patching material or the spalled, broken, or damaged Portland cement concrete
- Cleaning the open area by sandblasting
- Furnishing, placing, finishing, and curing the patching material
- Sawing and sealing new transverse and longitudinal joints

Payment will be made under:

Item No. 451	Patching Portland cement concrete pavement	Per square yard (meter)
--------------	--	-------------------------

451.5.01 Adjustments

General Provisions 101 through 150.

Section 452—Full Depth Slab Replacement

452.1 General Description

This work includes replacing Portland cement concrete pavement slabs, full or partial length. Remove the slabs according to the Plans or as directed by the Engineer. See Section 609.

452.1.01 Definitions

General Provisions 101 through 150.

452.1.02 Related References

Section 886—Epoxy Resin Adhesives

B. Referenced Documents

GDT 72

452.1.03 Submittals

Obtain approval of the mix design from the Office of Materials before using the mix.

452.2 Materials

Ensure that materials used in full depth slab replacement conform to the following Specifications:

Material	Section
Twenty-Four Hour Accelerated Strength Concrete	Section 504
Dowel Bars and Bar Coatings	Subsection 853.2.08
Epoxy	Section 886
Silicone Sealant	Subsection 833.2.06

452.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

452.3 Construction Requirements

452.3.01 Personnel

Furnish traffic control while the Department conducts slab movement testing described in Subsection 452.3.06.B. “Quality of Work” at no additional cost to the Department.

452.3.02 Equipment

Use sufficient equipment to perform work such as drilling dowel holes, setting dowels, spreading, striking off, consolidating, screeding concrete, and sawing and sealing joints. Obtain the Engineer’s approval of the equipment before starting the work.

Place the dowels at the locations specified on the Plans by using pneumatic or hydraulic drills and bits that will drill a 1-3/8 in (35 mm) diameter hole in the existing concrete faces.

452.3.03 Preparation

A. Clean the Exposed Faces

Before placing the concrete, thoroughly clean the vertical exposed faces of the existing slabs to remove contaminants.

1. Use wire brushing or other methods approved by the Engineer.
2. Remove existing silicone or other joint sealant from the exposed concrete faces.

B. Preparing Base

Remove debris and standing water from the base. Thoroughly compact loose base material by hand tamping before placing concrete.

452.3.04 Fabrication

General Provisions 101 through 150.

452.3.05 Construction

A. Installing the Dowels

Complete these steps to install the dowels:

1. Use a pneumatic or hydraulic drill to drill a 1-3/8 in (35 mm) diameter hole in the existing concrete faces. Place the dowels at locations specified on the Plans.
2. If the Engineer allows, drill a hole no greater than 1.5 in (38 mm) diameter to insert the dowel bars. Follow these guidelines:
 - a. Operate the equipment so as to prevent damage to the pavement being drilled.
 - b. Obtain the Engineer's approval for the drilling procedure.
 - c. Thoroughly clean the drilled holes of contaminants.
3. Set the type and size of dowels specified in the Plans into the hardened concrete face of the existing pavement with Type VIII epoxy bonding compound that meets the requirements in Section 886.
 - a. Place the dowels at locations noted on the Plans with one-half of the dowel protruding out of the pavement.
 - b. Place the dowels at the correct horizontal and vertical alignment. Do not misalign them more than 3/8 in (10 mm) within the vertical or oblique plane.
 - c. Place enough epoxy in the back of the hole to completely fill the entire cavity around the dowel upon insertion of the dowel bar. Remove excess epoxy.
 - d. Use epoxy adhesive packaged in a cartridge with a mixing nozzle that thoroughly mixes the two components as they are dispensed. Use a mixing nozzle at least 8 in (200 mm) long.
Or, use a machine that mixes the two components thoroughly to the proper ratio as the material is being placed.
 - e. Allow the epoxy to harden before placing the concrete to prevent the dowels from moving during the concrete placement.
4. At the free joints shown on the Plans, use epoxy-coated, plain, round, steel dowel bars that meet the requirements of Subsection 853.2.08.
Coat the protruding portion of the epoxy coated dowels with a thin film of grease or other approved material to ensure proper bond-breaking characteristics.
5. Cleanly saw the edges of the epoxy-coated smooth dowels bars. Do not shear them.

NOTE 1: Never drive dowels into a dowel hole with a sledge hammer or other device.

NOTE 2: Coated dowels will be rejected if they cannot be freely inserted into a dowel hole.

B. Setting Forms

Forms are not required for this work. The vertical faces of the existing pavement and shoulder bordering the replaced slab or joint area serve as the forms.

However, if the shoulder is irregular or unstable:

1. Place a form the full depth of the replaced slab or joint area to maintain a true, straight shoulder joint and to prevent the concrete from intruding into the shoulder area.
2. Compact the foundation under the form true to grade so that the form, when set, will firmly contact the base at the correct grade.
3. Clean and oil the forms before placing the concrete.
4. Wait four hours to remove the forms from the freshly placed concrete, unless otherwise specified. Carefully remove the forms to avoid damaging the pavement.
5. Repair the shoulder to the Engineer's satisfaction at no additional cost to the Department.

C. Placing and Finishing Concrete

The required concrete for the work will be 24-hour accelerated strength concrete that meets the requirements of Section 504. Obtain mix design approval from the Laboratory before use.

Place the concrete only when the ambient temperature is 40 °F (4 °C) and rising. Do not place concrete when the underlying base material is muddy or frozen.

1. Deposit the concrete within the slab replacement area in a way that requires as little rehandling as possible and prevents mix segregation.
2. Minimize hand spreading as much as possible. But where necessary, use shovels not rakes.

NOTE: Do not allow workmen to walk in fresh concrete with shoes coated with earth or other foreign substances.

3. Fill the replaced slab area with concrete and thoroughly consolidate by rodding, spading, and using sufficient vibration to form a dense homogeneous mass throughout the area.
4. Ensure the final surface area has a uniform appearance and is free of irregularities and porous areas.
The finished surface, including joints, shall meet a surface tolerance of 1/8 in. in 10 ft (3 mm in 3 m) in any direction.

For slab replacements done in preparation for resurfacing of the pavement, the finished surface, including joints, shall meet a surface tolerance of 3/16 in. in 10 ft (5 mm in 3 m) in any direction.

Perform necessary corrections by grinding according to Section 431. The Engineer may order replacement if any replaced slab is low in relation to adjacent slabs. The Engineer will require replacement if it is determined that excessive pavement grinding is necessary to match the profile of the full depth slab replacement or if grinding the adjacent pavement would create a drainage problem.

Do the following at no additional cost to the Department:

- Perform all necessary corrections
- Furnish all necessary traffic control personnel, materials, and equipment to detect deviations.
- Grind or replace slabs to correct surface tolerance deviations

If the Project involves resurfacing or grinding the pavement surface, a flat finish will be satisfactory. Otherwise, a broom or hand-tine finish will be required that will produce a surface texture depth of 0.20 in. (5mm) or greater as measured by GDT 72. The Engineer shall approve the finishing method and any deficient areas corrected to his or her satisfaction and performed at your expense.

D. Curing Concrete

Use the applicable portions of Section 504 regarding concrete mix and curing in this work.

E. Sawing and Sealing Joints

Establish transverse and longitudinal joints within the slab replacement area by doing the following:

1. Saw and seal the joints with silicone sealant that meets the requirements of Subsection 833.2.06. Seal according to Plan details and Section 461.
2. Ensure that the width of the sawed joints is 3/8 in (10 mm) , unless otherwise directed.
3. Saw and seal the joints as soon as possible, but not more than 60 days after placing the slab, unless the Plans specify otherwise.

Sawing and sealing of the reestablished joints is included in the bid cost for slab replacement.

F. Protecting from Rain

Properly protect the concrete from rain before the concrete hardens by following these guidelines:

1. Keep the materials to protect the concrete surface available at all times.
Protective materials include burlap or cotton mats, curing paper, or plastic sheeting material.
2. When rain is imminent, stop the paving operations and begin covering the surface of the unhardened concrete with the protective covering.

G. Working at Night

If night work is authorized on the Project, provide lighting for work performed at night for safety, traffic control, and work control and completion.

Correct unsatisfactory work to the Engineer's satisfaction at no additional cost to the Department.

H. Opening to Traffic

Schedule slab replacements so that the concrete will have a curing time of at least four hours. Complete the work and open the lanes to traffic before sunset the day it is placed, unless authorized otherwise.

The Engineer may require a longer curing period, mix design adjustments, or other corrective action to ensure sufficient concrete strength development before opening to traffic.

452.3.06 Quality Acceptance

A. Surface Tolerance

Ensure that the finished surface tolerance, including joints, is 1/8 in per 10 ft (3 mm in 3 m) in any direction. Make corrections by grinding according to applicable items in Section 431.

B. Quality of Work

Complete work that meets the requirements in the Specifications and Plans.

Until Final Acceptance of this work, replace damaged or broken slabs due to the following:

- Improper or unsatisfactory methods, equipment, or materials
- Construction or public traffic

Replace the slabs at no additional cost to the Department. The Department may also require removal and replacement of repaired slabs with a differential movement at the transverse joints greater than 0.01 in (0.25 mm) at no cost to the Department. The Department will measure the movement using an 18,000 lb (8165 kg) , single-axle load with dual tires and with the axial load centered 1 ft (300 mm) from the edge of the shoulders as close to the transverse joints as possible.

Section 452-Full Depth Slab Replacement

Testing will be done between 3:00 AM and 9:00 AM when slab movement is the greatest. The movement will be measured using dial gauges that can detect movement to the nearest 0.001 in (0.025 mm).

The Engineer will determine whether the slab movement test is required.

452.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

452.4 Measurement

Full depth replacement slabs are measured for payment by the cubic yard (meter) using the average squared dimensions times the average depth.

Dowels and dowel placement are not measured for separate payment but are included in the Unit Price bid for full depth slab replacement.

452.4.01 Limits

General Provisions 101 through 150.

452.5 Payment

Full depth replacement slabs will be paid for at the Contract Unit Price per cubic yard (meter). Payment is full compensation for:

- Furnishing materials including dowels, epoxy, and 24-hour accelerated strength concrete
- Performing work such as repairing shoulders if required, removing unsatisfactory material, sawing and sealing new joints, and performing other work specified in this Specification

Payment will be made under:

Item No. 452	Full depth slab replacement	Per cubic yard (meter)
--------------	-----------------------------	------------------------

452.5.01 Adjustments

General Provisions 101 through 150.

Section 453—Portland Cement Concrete Whitetopping

453.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 455—Filter Fabric for Embankment Stabilization

455.1 General Description

This work consists of placing filter fabric for embankment stabilization as shown in the Plans or as directed by the Engineer.

455.1.01 Definitions

General Provisions 101 through 150.

455.1.03 Submittals

General Provisions 101 through 150.

455.2 Materials

Use filter fabric that meets the requirements of Subsection 881.2.08, "Filter Fabric for Embankment Stabilization".

455.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

455.3 Construction Requirements

455.3.01 Personnel

General Provisions 101 through 150.

455.3.02 Equipment

General Provisions 101 through 150.

455.3.03 Preparation

Prior to placing filter fabric, remove logs, stumps, and any other objects from the ground surface that would tend to puncture the fabric. Leave grasses that have formed root mats in place to provide support for fabric placement.

455.3.04 Fabrication

General Provisions 101 through 150.

455.3.05 Construction

A. Filter Fabric Placement

Place and protect filter fabric as follows:

1. Place filter fabric according to the locations and details shown on the Plans.
2. Ensure the fabric is placed with the warp direction perpendicular to the roadway direction and sewn as shown on the Plans unless otherwise directed.
3. Spread the filter fabric as uniformly as practical over the contour of the ground to avoid looseness.
4. Ensure field sewn seams are made with a lock stitch and comply with the requirements for factory seams as given in the material specifications.
5. Protect the filter fabric from chemicals and prolonged sunlight.
6. Replace any filter fabric damaged by neglect at no additional cost to the Department.

B. Fill Placement Over Fabric

Place fill over the filter fabric according to the Plans and applicable portions of Section 208. Maintain at least 8 in (200 mm) of soil between the fabric and any construction equipment.

455.3.06 Quality Acceptance

General Provisions 101 through 150.

455.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

455.4 Measurement

This work is measured in square yards (meters) of accepted materials in place.

455.4.01 Limits

General Provisions 101 through 150.

455.5 Payment

Filter fabric for embankment stabilization is paid for at the Contract Price per square yard (meter), complete and in place. Payment is full compensation for furnishing materials, placing materials, sewing of fabric as required, and for all labor, equipment, tools and incidentals necessary to perform the work.

Payment will be made under:

Item No. 455	Filter fabric for embankment stabilization	Per square yard (meter)
--------------	--	-------------------------

455.5.01 Adjustments

General Provisions 101 through 150.

Section 456—Indentation Rumble Strips

456.1 General Description

This work includes constructing rumble strips on paved shoulders or centerlines by milling or grinding 1/2 in (13 mm) deep depressions into the finished surface as shown in the Plans.

456.1.01 Definitions

Skip ground in place rumble strips—Rumble strips placed with 28 ft (8.5 m) of strips and 12 ft (3.7 m) of clear space between.

Continuous ground in place rumble strips—Rumble strips placed continuously.

Edge line rumble strips – Rumble strips placed continuously on the edge line traffic stripe.

Centerline rumble stripes – Rumble strips placed continuously on the centerline traffic striping.

456.1.02 Related References

A. Standard Specifications

General Provisions 101 through 150.

456.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

456.3 Construction Requirements

456.3.01 Personnel

General Provisions 101 through 150.

456.3.02 Equipment

A. Cutting Tool

Use a cutting tool that meets these requirements:

- Has independent suspension from the power unit to allow the tool to self-align with the slope of the shoulder
- Is equipped with guides to provide consistent alignment of each line of indentations in relation to the roadway
- Houses a single rotary-type milling/grinding head in line in the direction of travel
- The cutting tips on the milling/grinding head are arranged to provide a smooth cut with no more than 0.05 in (1 mm) between the peaks and valleys

456.3.03 Preparation

General Provisions 101 through 150.

456.3.04 Fabrication

General Provisions 101 through 150.

456.3.05 Construction

A. Indentations

Form the rumble strip indentations as follows:

1. For traveled ways opened to traffic, install the indentations within ten calendar days.
2. Ensure the finished indentations conform to the following:
 - a. Indentations have a concave circular shape and are spaced 12 in (300 mm) center to center.
 - b. Skip, continuous, and centerline rumble strips indentation dimensions:
 - 7 in (175 mm) wide with a 5 in (125 mm) gap in the direction of travel
 - 16 in (400 mm) long when measured perpendicular to the direction of travel.
 - Minimum 1/2 in (13 mm) maximum 5/8 in (16 mm) deep at center.
 - c. Edge line rumble strip indentation dimension:
 - 7 in (175 mm) wide with a 5 in (125 mm) gap in the direction of travel
 - 6 in (150 mm) long when measured perpendicular to the direction of travel.
 - Minimum 1/2 in (13 mm) maximum 5/8 in (16 mm) deep at center.

Excess waste material resulting from the operation may be swept to the grassed shoulder and spread where applicable. If an adjacent grassed shoulder is not available, or if directed by the Engineer, remove and dispose of the waste material in a manner approved by the Engineer.

456.3.06 Quality Acceptance

General Provisions 101 through 150.

456.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

456.4 Measurement

Indentation rumble strips are measured by the gross linear mile (kilometer). The Plan quantity is the pay quantity unless the Engineer makes authorized changes. No deductions will be made for intersections, ramps, bridges, or skips.

456.4.01 Limits

General Provisions 101 through 150.

456.5 Payment

Payment will be made at the Contract Unit Price bid per gross linear mile (kilometer). Payment is full compensation for furnishing equipment and labor and for satisfactorily performing the work.

Payment will be made under:

Item No. 456	Indentation rumble strips—ground in place (continuous)	Per gross linear mile (kilometer)
Item No. 456	Indentation rumble strips—ground in place (skip)	Per gross linear mile (kilometer)
Item No. 456	Indentation edge linerumble strips—ground in place (continuous)	Per gross linear mile (kilometer)
Item No. 456	Indentation centerline rumble strips—ground in place (continuous)	Per gross linear mile (kilometer)

456.5.01 Adjustments

General Provisions 101 through 150

Section 457—Geogrid Reinforcement

457.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 461—Sealing Roadway and Bridge Joints and Cracks

461.1 General Description

This work includes removing the existing sealant material (if applicable), cleaning the joint, and installing silicone sealant in the roadway and bridge joints specified on the Plans. The Plans will designate the:

- Type of joint (transverse or longitudinal)
- Location of joint (mainline, shoulder, ramps, acceleration/deceleration lanes)
- Type of joint (roadway, bridge) to be resealed
- Which type silicone to use (Type A, B, C, or D)

The Engineer will determine the roadway and bridge cracks to be resealed. Unless otherwise specified on the Plans, use Type A silicone for roadway joints and use Type D silicone for bridge joints.

461.1.01 Definitions

General Provisions 101 through 150.

461.1.02 Related References

A. Standard Specifications

- Section 430—Portland Cement Concrete
- Section 500—Concrete Structures
- Section 833—Joint Fillers and Sealers
- Section 886—Epoxy Resin Adhesives

B. Referenced Documents

- QPL 66

461.1.03 Submittals

General Provisions 101 through 150.

461.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Silicone Sealant and Bond Breakers	833.2.06
Epoxy Resin Adhesives	886

For a list of silicone joint sealant sources, please see QPL 66.

Select and use bond breakers [backer rod (if required) or tape] according to Subsection 833.2.06.A.2, “Bond Breakers”

461.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

461.3 Construction Requirements

461.3.01 Personnel

General Provisions 101 through 150.

461.3.02 Equipment

A. Air Compressors

Use air compressors equipped with traps to remove surplus water and oil in the compressed air. Do not use contaminated air. Ensure that the compressor can deliver compressed air at a continuous pressure of at least 90 psi (600 kPa).

The Engineer may check the compressed air for contamination.

B. Silicone Sealant Pump

Apply silicone sealant by pumping only. Use a caulking gun with a cartridge for touch-up work or small applications only.

Use a pump with sufficient capacity to deliver the necessary volume of silicone to completely fill the joint in a single pass.

Ensure that the nozzle’s size and shape closely fits into the joint to fill the joint with sealant with enough force to prevent voids in the sealant and to force the sealant to contact the joint faces.

C. Caulking Gun

Use a caulking gun with cartridge for the following situations:

- Touch up work.
- Placing vertical runs of Type A silicone in a bridge deck joint when Type B, C, or D silicone is used in the horizontal runs.
- Sealing voids and cracks with Type A silicone where Type B, C, or D silicone (which will be applied on top of the Type A silicone) might leak through.
- Sealing small cracks in the concrete.

461.3.03 Preparation

Before installing a bond breaker or sealant, ensure that the joint is clean and dry. Complete all cleaning, air blasting, or air drying.

461.3.04 Fabrication

General Provisions 101 through 150.

461.3.05 Construction

A. Resealing Existing Joints

1. Remove Existing Sealant

Completely remove the existing sealant in the joints. Take care during removal and cleaning to prevent damaging or enlarging the existing width of the joint. Repair any damaged areas at no cost to the Department.

2. Depth of Existing Joint

Determine if the joint depth will accommodate the required sealant thickness and bond breaker and provide the required recess below the riding surface.

Consider that the backer rod is thicker after it is squeezed into the joint.

If necessary, saw the existing joint deeper and wider to provide the joint depth and width specified on the Plans.

3. Clean the Joint

Thoroughly clean the joint of all foreign material including oil, asphalt, curing compound, sealant adhesive, paint, rust, and existing sealant, if still present. Demonstrate to the Engineer that the proposed method of cleaning old sealant or foreign material from joints will not widen the joints by more than 0.040 in (1 mm). The method shall not alter the joint profile (including rounding of the top corner) or alter the texture of the concrete riding surface. Do not use chemical agents to clean the joint. Ensure that the cleaning process produces a new, clean concrete face on the vertical faces of the joint.

B. Sealing New Joints

1. Sawing

Saw the transverse and longitudinal joints according to the Specifications and Plan details.

- a. Make the initial cut and wait for the concrete to harden enough to prevent spalling or raveling:
- b. Make the second cut to the width and depth shown on the Plans.

NOTE: Do not use a gang saw to make a completed cut in a single operation.

- c. If spalling of the sawed edge harms the joint seal, patch the spall with an approved epoxy patching compound and allow it to fully cure before installing the joint sealant.
- d. Make each patch to the intended neat lines of the finished cut joint.

2. Cleaning Freshly Cut Sawed Joints

Immediately after sawing the joint do the following:

- a. Completely remove the resulting slurry from the joint and clean the immediate area by flushing it with a jet of water under pressure. Use other tools as necessary.
- b. When the surfaces are thoroughly clean and dry and immediately before placing the joint sealer, use compressed air with a pressure of at least 90 psi (620 kPa) to blow out the joint and remove dust traces.
- c. If freshly cut sawed joints are contaminated before they are sealed, clean them according to Section 461.
- d. Ensure that cleaning methods do not alter the joint profile, the rounding of the top corners, or the concrete riding surface texture. Do not clean the joint with chemical agents.

C. Sealing Joints

1. Install Bond Breakers

Select and use bond breakers [backer rod (if required) or tape] according to Section 833.2.06.A.2.

- a. Before installing a bond breaker, clean and dry the joint or crack. Before placing the bond breaker and sealant, complete the cleaning, air blasting, or air drying.
- b. Ensure that the backer rod diameter is at least 25 percent larger than the joint width.
- c. Install the backer rod in the joint at the depth specified on the joint detail in the Plans, as directed by the Engineer, and according to Subsection 461.3.05.B.

NOTE: The width of some bridge joints may require back-up material other than the typically shaped round backer rod.

- d. Use material available in square or rectangular shapes, or cut the strips from sheet stock to fit properly into the joint. Use approved bond breaking tapes in place of backer rod in some applications. See Plan details for various joint types.

2. Install Silicone Sealant

Install the silicone sealant immediately after cleaning the joint or crack and installing the bond breaker. Keep the joint or crack clean and dry.

If the joint or crack becomes contaminated, damp, or wet, remove the bond breaker if it has been installed. Clean and dry the joint or crack and install a new bond breaker before placing the sealant.

Follow these guidelines when placing the sealant:

- a. Ensure that the air temperature during placement is at least 40 °F (4 °C).
- b. Use a pump to apply the silicone sealant. The pump must be able to completely fill the joint to the specified width and height of sealant in one pass.
Use a nozzle with the proper size and shape to closely fit inside the joint. The sealant must be introduced inside the joint with enough pressure to prevent voids in the sealant and to force the sealant into contact with the joint faces.
- c. Use a caulking gun with cartridge for touch-up work, small applications (such as vertical runs with Type A silicone in a bridge deck joint when Type B, C, or D silicone is used), and to seal voids and cracks with Type A silicone where Type B, C, or D silicone might leak through. You may also use a caulking gun to seal small cracks in the concrete.
- d. After placing Type A silicone sealant, tool it to provide the specified recess, thickness, and shape as shown on the Plans. Apply sufficient force to the sealant in this tooling operation to force the sealant against the joint faces and to ensure proper wetting and bonding of the sealant to the joint faces.
Type B, C, and D silicones are self-leveling and do not normally require tooling.
- e. Because of the consistency of Type B, C, and D silicones, ensure that the bond breaker completely closes off gaps and voids where the silicone might leak through.

Section 461-Sealing Roadway and Bridge Joints and Cracks

To ensure that the gaps are closed use any of the following methods:

- Stuff small pieces of backer-rod into the gaps and voids
- Place a piece of bond breaking tape over the void
- Use Type A silicone to seal the void.

If using Type B, C, or D silicone and a backer-rod, ensure the backer rod is Type M. Do not use Type L backer-rod with Type B, C, and D silicone.

f. Place the sealant to conform to the specified recess and thickness shown in the Plans.

3. Clean Pavement

After sealing a joint or crack, immediately remove the surplus sealant or other residue on the pavement or structure surfaces.

4. Open to Traffic

Do not permit traffic on the sealed joints or cracks until:

- The sealant is tack free.
- The sealant has cured enough to resist displacement from slab movement or other causes.
- Debris from traffic does not imbed into the sealant.

5. Special Requirements

The following requirements apply to this work:

a. Seal the joints and cracks for any one day's work on resealing projects within 30 calendar days after surface grinding for that day is completed, unless otherwise specified on the Plans. Seal joints on new pavement after the curing period.

When the Plans call for resealing before specified grinding, increase the recess depth and joint depth by 1/4 to 3/8 in (6 to 10 mm) to compensate for the depth of the pavement removed during the grinding operation.

b. The Engineer will determine all cracks to be resealed.

c. Route cracks to the depth specified on the Plans by wet or dry sawing with diamond or abrasive blades. Remove sawing residue or other contaminants.

d. If the manufacturer recommends a primer, use it according to the recommendations. When required, install primer before the backup material.

e. Seal the bridge joints, including the approach slab, specified on the Plans.

Only reseal non-armored joints (one-sealant receptacle and concrete surfaces on joint faces), unless otherwise indicated on the Plans.

461.3.06 Quality Acceptance

If a sealed joint fails due to any of the following reasons, it will be rejected.

- Adhesion or cohesion failure of joint material
- Unsatisfactory or improper quality of work
- Damage by operations or public traffic
- Damage to the sealant from displacing because of slab movements or insufficient curing before opening to traffic

Repair the joint to the Engineer's satisfaction at no additional cost to the Department.

461.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

461.4 Measurement

When listed as a pay item in the Proposal, joints and cracks sealed and resealed will be measured in linear feet (meters).

Section 461-Sealing Roadway and Bridge Joints and Cracks

No separate measurement and payment will be made unless a pay item for the work is included in the Proposal. If no pay item is included in the Proposal, include the cost of the joint sealing and resealing in the overall bid price submitted.

No separate measurement or payment will be made for any sawcutting required to seal or reseal the joint.

461.4.01 Limits

General Provisions 101 through 150.

461.5 Payment

When listed as a pay item in the Proposal, joints and cracks sealed or resealed will be paid for at the Contract Unit Price bid per linear foot (meter). Payment is full compensation for furnishing materials, equipment, tools, labor, and incidentals to complete the work.

Payment will be made under:

Item No. 461	Resealing roadway joints and cracks, type____	Per linear foot (meter)
Item No. 461	Resealing bridge joints, type____	Per linear foot (meter)
Item No. 461	Sealing roadway joints and cracks, type____	Per linear foot (meter)
Item No. 461	Sealing bridge joints, type____	Per linear foot (meter)

461.5.01 Adjustments

General Provisions 101 through 150.

Section 500—Concrete Structures

500.1 General Description

This work consists of manufacturing and using Portland cement concrete to construct structures. See the Contract Plans for the specified color and locations for placing integrally colored concrete.

500.1.03 Submittals

A. Concrete Mix Designs

The Contractor is responsible for all concrete mix designs. Ensure that concrete mixes contain enough cement to produce workability within the water-ratio specified in Table 1—Concrete Mix Table , below.

Design concrete mixes that meet the requirements of the Table 1—Concrete Mix Table , below. The Office of Materials will determine the concrete properties using the applicable method in Section 500 of the Sampling, Testing, and Inspection Manual.

Table 1—Concrete Mix Table

English								
Class of Concrete	(2) Coarse Aggregate Size No.	(1 & 6) Minimum Cement Factor lbs/yd ³	Max Water/Cement ratio lbs/lb	(5) Slump acceptance Limits (in)		(3 & 7) Entrained Air Acceptance Limits (%)		Minimum Compressive Strength at 28 days (psi)
				Lower	Upper	Lower	Upper	
“AAA”	67,68	675	.440	2	4	2.5	6.0	5000

NOTES:

1. Portland cement may be partially replaced with fly ash as provided in Subsection 500.3.04.D.4 or with granulated iron blast furnace slag as provide for in Subsection 500.3.04.D.5.
2. Specific size of coarse aggregate may be specified.
3. Lower limit is waived when air entrained concrete is not required.
4. The mixture will be capable of demonstrating a laboratory compressive strength at 28 days of 1000 psi (7 MPa) + 0.18 R*. Compressive strength will be determined based upon result of six cylinders prepared and tested in accordance with AASHTO T 22 and T 126.

* Where R = Difference between the largest observed value and the smallest observed value for all compressive strength specimens at 28 days for a given combination of materials and mix proportions prepared together.

- 5. **Designed slump may be altered by the Office of Materials when Type “F” water reducers are used.**
- 6. **Minimum cement factor shall be increased by 50 lbs/yd³ (30 kg/m³) when size No. 7 coarse aggregate is used.**
- 7. **When Class A is specified for bridge deck concrete, the entrained air acceptance limits shall be 3.5% to 7.0%.**

Submit all concrete mix designs to the Office of Materials (OM) for review. The Department will approve mixes that contain materials from approved sources and produce concrete that meets these Specifications.

Submit concrete mix design proportions for approval by one of the following methods:

1. Request Approval of Specific Proportions

When requesting approval of specific concrete mix design proportions for classes of concrete, include the following information:

- Source of each material
- Apparent specific gravity of the cement and the fly ash, if used
- Bulk specific gravity (saturated surface dry) of each aggregate
- Percent absorption of each aggregate
- Amount of each material required to produce a cubic yard (meter) of concrete
- Proportions of admixtures per cubic yard (meter) of concrete and any use limitations
- Proposed slump and air content of the design
- Evidence that the proposed mixture complies with Subsection 500.1.03

Concrete mix designs that do not have a proven performance record and have not been used by the Department must meet minimum laboratory strength requirements.

2. Obtain Ready-Mix Design Proportions for commonly used materials

Get approved concrete mix designs from authorized ready-mix concrete plants.

Ready-mix concrete plants approved according to Laboratory Standard Operating Procedure “Quality Assurance for Ready Mix Concrete Plants in Georgia” are authorized to submit concrete mix designs for approval. See QPL 10 for a list of approved plants.

3. Use Laboratory-Designed Proportions for commonly used materials

Use laboratory-designed concrete mix proportions from either of the following sources:

- a. Laboratory-designed proportions are available for commonly used combinations of materials. Request these mixes in writing from the State Materials Engineer. Request specific classes of concrete and specify the source of ingredients.
- b. Select a combination of materials from approved sources and request that the laboratory determine a mix that meets requirements in the Table 1—Concrete Mix Table above. The laboratory will establish proportions for strength and workability under laboratory conditions.

B. Delivery Tickets

Have the concrete plant transmit delivery tickets (DOT Form 525) with each load of concrete delivered to the work site. Give the Engineer one of these delivery tickets.

Ensure that the following information is on the delivery ticket:

- Project designation
- Date
- Time
- Class and quantity of concrete

- Actual batch proportions
- Free moisture content of aggregates
- Quantity of water withheld
- Concrete mixing revolutions

If available forms do not provide the required information, ask the Engineer to provide one.

C. Formwork Plans

The Engineer may require detailed formwork plans for review. If so prepare the formwork plans and submit them to the Engineer. In no case will the Contractor be relieved of responsibility for the formwork plans.

When constructing permanent steel bridge deck forms, submit bar support details and types to the Department for approval before placing the deck form reinforcement.

D. Falsework Plans

Submit, for review by the Engineer, detailed falsework plans for spans under which traffic flows.

The Engineer may require plans for spans that do not accommodate traffic.

E. Shop and Erection Drawings

Submit fabricators' shop and erection drawings to the Engineer for review and approval. Indicate the following in the drawings:

- Grade of steel
- Physical and section properties for permanent steel bridge deck form sheets
- Locations where the forms are supported by steel beam flanges subject to tensile stresses

F. Hauling Vehicle Information

Before hauling starts on new bridges, submit the following information for each vehicle:

- Weight on each axle, empty
- Weight on each axle, fully loaded
- Center-to-center distances of axles
- Center-to-center distances of wheels measured parallel to each axle

G. Cold Weather Concrete Curing and Protection Plan

Secure the Engineer's approval of a "Cold Weather Concrete Curing and Protection Plan" for bridges and structures. Emphasize protection for the underside of bridge decks when using metal forms and include the protection procedures to be used.

Protection procedures shall keep the concrete above 50 °F (10 °C) for 72 hours after placement and above freezing for 6 days after placement. Choose the protection method from Table 2 based on the expected temperature within 48 hours after concrete placement.

Table 2—Cold Weather Protection

Protection Procedure	Expected Temperatures Within 48 Hours
Heated enclosures	Below 25 °F (-4 °C)
Commercial blankets	Below 25 °F (-4 °C)
Batt insulation	Below 25 °F (-4 °C)
Heavy-duty polyethylene	25 °F (-4°C) or above

H. Color Additives

Submit to the Engineer the following:

1. Product Data: Manufacturer’s specifications and instructions for color additives.
2. Samples for Concrete Color Selection: Submit sample chip of specified color indicating color additive number and required dosage rate. Submittals are for general verification of color.

500.2 Materials

Ensure that materials meet the Specification requirements of Table 3:

Table 3—Materials Specifications

Material	Section
Coarse Aggregate (1)	800.2.01
Fine Aggregate Size No. 10	801.2.02
Dampproofing or Waterproofing Material (Bituminous)	826.2.01
Portland Cement (2)	830.2.01
Portland-Pozzolan Cement (2)	830.2.03
Admixtures:	
Air-Entraining Admixtures	831.2.01
Retarding Admixtures	831.2.02
Water Reducing Admixtures	831.2.02
Granulated Iron Blast-Furnace Slag	831.2.03.A.3
Fly Ash	831.2.03.A
Curing Agents	832
Joint Fillers and Sealers	833
Special Surface Coating	836
Linseed Oil	870.2.06.A.
Mineral Spirits	870.2.06.A.4
Water	880.2.01
Graded Aggregate (3)	815.2.01
Graffiti Proof Coating	838.2.01

Material	Section
Concrete used in Bridge Construction	500.3.04.F
1. Use either Class A or Class B coarse aggregate of the designated size, except when using limestone or dolomite in bridge structures. When using limestone or dolomite, use Class A coarse aggregate.	
2. Use Type I or Type II Portland cement or Type IP Portland-Pozzolan cement unless otherwise specified. Do not use air-entraining cement.	
3. The gradation requirements of graded aggregate are modified to require 30% to 45% by weight passing the No. 10 (2.00 mm) sieve.	

Construct bridge sections containing duct enclosures for stressing tendons using concrete with a maximum stone size of No. 7.

Use concrete manufactured at plants that qualify as approved sources according to the Standard Operating Procedure for Ready Mix Concrete. See QPL 10 for a list of approved plants.

For a list of approved deck oil protective surface treatment sources, see QPL 23.

Use colored concrete additive made with pure, concentrated mineral pigments especially processed for mixing into concrete and complying with ASTM C 979.

If adding color additives to the mix at the jobsite, furnish color additives in pre-measured Mix-Ready disintegrating bags to minimize jobsite waste.

Do not use accelerator admixtures containing calcium chloride in colored concrete mix.

500.2.01 Delivery, Storage, and Handling

A. Aggregate Stockpile

Stockpile aggregate as follows:

1. Keep stockpile areas firm, reasonably level, well-drained, clean, and free of sod or foreign matter.
2. Stockpile aggregate separately by type and source.
3. Form stockpiles using methods and equipment that do not cause the aggregate to segregate, become contaminated, or degrade. The Engineer may reject improperly formed stockpiles.
4. Stockpile aggregate long enough for the moisture content to stabilize.
5. Do not use aggregates stored in pits or silos that contain water.

B. Aggregate Handling

Operate aggregate handling equipment carefully to minimize segregation, breaks, spills, contamination, and mixing of the sizes and types of aggregates.

C. Cement Storage

Store cement as specified below. Reject all caked, lumpy, or contaminated cement.

1. Bulk Cement

Use bulk cement unless the Engineer allows bag cement to be used.

Store bulk cement in bins or silos designed for this purpose. Provide moisture-proof storage containers with a mechanism that allows cement to flow freely from the discharge opening.

2. Different Brands

Store and use cement of different brands and types, or from different mills separately.

D. Admixture Storage and Handling

Carefully store and dispense admixtures as recommended by the manufacturer to prevent contamination.

E. Concrete Handling and Placing

Handle and place concrete according to the following:

1. Haul Time Limitations

Ensure that concrete reaches its final position in the forms within one hour after adding the cement to the aggregates. If retarders or water reducers are used, the allowable time limit increases to 1-1/2 hours. Test concrete immediately for acceptance tolerances before placing in forms using limits established in Table 1—Concrete Mix Table.

2. Placement Limitations

After delivering the concrete to the job site or the staging area at the site or after mixing the concrete at the site, transport it carefully to the placement point to prevent excessive slump loss or segregation. Use any of the following equipment:

- Buckets
- Buggies
- Pumps
- Other approved means

F. Form Storage

Store forms off the ground.

G. Precast Unit Handling

Except as noted below, the applicable portions of Subsections 507.2.01, “Delivery, Storage, and Handling,” 507.3.05.A, “Prepare Bearing Areas,” 507.3.05.B, “Erecting PSC Bridge Members,” and 507.3.05.D, “Concrete Finish,” shall govern.

Handle precast, nonprestressed units as follows:

1. Do not lift the units from the casting bed until the concrete reaches a strength of at least 1,500 psi (10 MPa).
2. Do not transport or erect the units until they reach a strength of at least 3,000 psi (20 MPa).
3. Restrict live loads (including erection equipment) on the units until they reach a minimum strength of 4,500 psi (30 MPa).

H. Color Additives

Comply with manufacturer’s instructions. Deliver to site or batch plant in original, unopened packaging. Store color additives in dry conditions.

500.3 Construction Requirements

500.3.01 Personnel

A. Supervision, Personnel, and Skilled Workers

Provide enough supervision, personnel, and skilled workers to do the following:

1. Properly produce, place, and finish concrete in each pour unit according to Subsection 500.3.05.P, Table 5—Minimum Placement Rates or as required by the Plans.
2. Check screed clearances and tolerances before beginning deck pours.
3. Place concrete without delays.

B. Plant Operator Certification

Volumetric proportioning requires that the operator be certified by the Office of Materials.

500.3.02 Equipment

A. Equipment Restrictions

Do not use delivery, conveyance, or vibratory units that leak grout, water, oil, or gas.

Provide enough equipment, tools, and materials to properly produce, place, and finish concrete in each pour unit according to the Subsection 500.3.05.P, Table 5—Minimum Placement Rates or as required by the Plans.

The Engineer may prohibit equipment that delays concrete placement.

B. Volumetric Proportioning Equipment

When concrete ingredients are proportioned volumetrically, obtain the Engineer’s approval for the equipment and its calibration and operation.

Ensure the following:

- The equipment meets the specifications in ASTM C 685.
- The concrete producer conducts calibration tests at least every 6 months.
- The equipment is calibrated for each new concrete mix before production.

C. Batching Plant Equipment

Ensure that batching plants have the following equipment and that the equipment meets the standards listed.

1. Bins

Ensure that bins and bin compartments meet the following standards:

- Adequate capacity for the required concrete production
- Supported on a rigid framework on a stable foundation capable of holding the bins securely
- Designed to discharge efficiently and freely into the weigh hopper
- Positive means of control that slows down and shuts off the material flow when the weigh hopper has the correct quantity.
- Discharging mechanisms that prevent material leaks when closed
- Leak-free aggregate storage bins
- Divided aggregate storage bins for fine aggregate and each size of coarse aggregate
- Partitioned aggregate storage bin compartment that prevents the materials from mixing
- Leak-proof, moisture-proof cement bins with a vibrator or other mechanism to discharge cement

2. Weigh Hoppers

Ensure that weigh hoppers meet the following standards:

- Have suitable containers freely suspended from scales
- Have adequate capacity to maintain the Subsection 500.3.05.P, Table 5—Minimum Placement Rates
- Have a discharge mechanism that prevents material leaks when closed
- Have vents to permit air to escape
- Have vibrators or other equipment that ensures complete and efficient discharge of materials
- Have a dust seal and a port or valve for sampling cement

3. Scales

Scales used for weighing concrete materials shall have accuracy within plus or minus one percent under operating conditions.

Ensure the following:

- When directed by the Engineer, the owner demonstrates the accuracy of the scales.

- Scales are kept clean and in good operating condition.
- The scale operator can clearly see indicating devices.
- The scale operator can easily access controls.

D. Mixers and Agitators

Ensure that mixers and agitators meet the following requirements:

1. General Requirements for Mixers and Agitators

Provide mixers and agitators that meet these requirements:

a. Capacity Plates

Ensure that the mixer or agitator has a legible metal plate or plates attached in an easily visible location. The plates shall indicate the rated capacity in cubic yards (meters) for mixing and agitating.

c. Concrete Production

The mixer shall produce concrete that meets the requirements in the Table 1—Concrete Mix Table .

d. Mixer Performance Test

The mixer or agitator may be required to pass a mixer performance test. Mixer performance will be evaluated at the discretion of the Engineer.

Mixer performance tests will include the following by the OMR:

- 1) Taking samples of concrete at the one-quarter and three-quarter points of the batch discharge
- 2) Measuring the slumps of each concrete sample

If the two slump values differ by more than 2 in (50 mm), do not use the mixer or agitator until it meets the requirements of the test.

The Engineer may permit the equipment to be used if the 2 in (50 mm) tolerance can be met by using a longer mixing time or a smaller batch.

2. Mixing Speed

Follow these guidelines for mixing speed:

- Do not exceed 150 revolutions at mixing speed.
- Discharge all concrete from truck mixers before drum or blades reach 300 revolutions, including revolutions at agitating speed.
- Use the mixing speed defined by the manufacturer for the mixing equipment.
- If the manufacturer’s definition of mixing speed is not available, use a mixing speed of 6 to 18 revolutions per minute.

3. Mixer and Agitator Maintenance

Maintain mixers and agitators as follows:

- a. When mixers and agitators are discharged, remove the entire contents before adding materials for the next batch.
- b. Clean mixers and agitators often to prevent concrete and grout accumulation.
- c. Do not discharge cleaning water into any pipe, catch basin, or structure.
- d. If cement or aggregates accumulate in mixers and agitators when cleaning water is discharged, remove them immediately at no expense to the Department.

4. Mixer Types

Use stationary mixers or truck mixers.

a. Stationary Mixers

Ensure that stationary mixers meet the following standards:

- 1) Combine the concrete ingredients into a homogeneous, uniform mass within the specified time and when loaded to capacity.

- 2) Efficiently and uniformly discharge the concrete within the tolerances allowed in Subsection 500.3.02.D.1.c, "Mixer Performance Test."
- 3) Permit discharge only after the specified mixing time has elapsed using a locking device.

b. Truck Mixers

Ensure that truck mixers meet the following standards:

- Meets the requirements listed in Subsection 500.3.02.D.4.a, "Stationary Mixers"
- Has an approved revolution counting device in good operating condition
- Does not haul more than the rated capacity in cubic yards (meters) as shown on the attached capacity plates

5. Agitator Types

Use truck agitators or truck mixers operating at agitating speed.

Ensure that agitators meet the following requirements:

- a. Keeps the mixed concrete in a homogeneous, uniform mass
- b. Efficiently and uniformly discharges the concrete within the tolerances allowed in Subsection 500.3.02.D.1.c, "Mixer Performance Test"

E. Concrete Buckets

Keep concrete buckets clean and in good working condition.

F. Concrete Buggies

Keep concrete buggies clean and in good working condition.

G. Concrete Pumps

Concrete pumping equipment is subject to the Engineer's approval. Use pumping equipment that has adequate capacity and is suitable for the proposed work.

H. Chutes and Troughs

Do not use chutes longer than 50 ft (15 m) without the Engineer's permission.

Flush chutes and troughs with water after each run. Do not discharge this water into freshly placed concrete or into conveyance unit.

Promptly remove hardened concrete from chutes and troughs.

Ensure that chutes and troughs meet the following requirements:

1. Metal or metal lined
2. Slope not exceeding one vertical to three horizontal
3. Baffles or a series of short lengths placed to reverse the direction of the concrete flow, when used on steep slopes

I. Pipes or Tubes

Use pipes or tubes to place concrete when the operation requires dropping the concrete more than 5 ft (1.5 m). Thoroughly clean the pipes or tubes after each pour.

Use pipes made of metal or other approved material and long enough to deposit the concrete as close to its final position as possible.

J. Vibrators

Provide enough vibratory units, including at least one additional stand-by unit in good working condition, to compact concrete immediately after it is placed. Have a stand-by unit at the site before each pour is started.

On Projects consisting entirely of small pours (10 yd³ [8 m³] or less), the Engineer may waive the stand-by requirement.

Ensure that vibrators meet the following conditions:

- Approved internal rotation-type design
- A power supply that constantly vibrates the concrete at frequencies of not less than 4500 impulses per minute
- A vibration intensity that visibly affects a mass of concrete with a 1 in (25 mm) slump through at least a 18 in (450 mm) radius

K. Screeds

Do not use vibratory screeds (screeds that use a transverse strike-off motion) without the Engineer's approval. Use screeds that are:

- Mechanically operated
- Designed and constructed to screed with the strike-off parallel to the center line
- Readily adjustable
- Capable of maintaining proper adjustment throughout the screeding operation

The two screed types are:

1. Longitudinal Screeds

Unless otherwise noted on the Plans, use longitudinal screeds only on pour lengths of 70 ft (20 m) or less.

2. Transverse Screeds

Use transverse screeds on any pour, unless otherwise noted on the Plans. However, transverse screeds are required on pour lengths above 70 ft (20 m).

Support screeds outside the pour area that will receive a surface finish. Do not use intermediate supports or guides.

Adjust screeds to the camber specified on the Plans. Check the camber as often as necessary.

Have the Engineer approve the following for screeds and their supports:

- Weight
- Durability
- Adjustability
- Accuracy
- Mechanical condition
- Operational results

Furnish the equipment necessary to check screed clearances and tolerances before pouring decks.

L. Underwater Placement Equipment

Place concrete under water using the following underwater placement equipment:

1. Tremie

Use a tremie when depositing concrete in water above 10 ft (3 m) deep. Ensure that tremie is:

- At least 8 inches in (200 mm) diameter
- Constructed in sections with watertight couplings

2. Bottom Dump Bucket

Where the Engineer permits, use a bottom dump bucket in water up to 10 ft (3 m) deep.

Ensure that the bottom of the bucket opens only when it touches the surface that receives the charge and that the top of the bucket has a lid or cover.

M. Fogging Equipment

To supply additional moisture to the concrete, use fogging equipment with the following characteristics:

- A heavy-duty pump capable of delivering 2 gal (7.6 L) of water per minute to a 0.062 in (1.6 mm) diameter tip at an air pressure of 100 psi (700 kPa).
An example of a suitable pump is the Alemite Pump 7878-A.
- The ability to consume approximately 22 ft³/min (0.6 m³/min) of compressed air
- A 3/8 in (10 mm) inside diameter hose long enough to reach all areas of the deck
- An adjustable spray gun and tip to provide various patterns of atomized spray or fog for changing finishing conditions
An example of a suitable spray gun is the Gun Jet No. 43 with a 120-2 Multee Jet Nozzle.

If necessary, substitute other equipment that is capable of equal performance.

500.3.03 Preparation

A. Pre-Pour Conference

Before beginning deck placement operations on each Project, and for individual deck pours of an unusual nature, the Engineer will schedule a pre-pour conference with Project supervisory personnel and a representative of the concrete supplier, if applicable.

Conference topics of discussion include the following:

- Reinforcing steel support method
- Final screed setting check
- Anticipated placement rate
- Personnel number
- Equipment type
- Curing methods
- Adverse weather placement procedures
- Emergency procedures
- Other Work-related details

500.3.04 Fabrication

A. Measure Materials

Measure materials as follows:

1. **Cement.** Weigh bulk cement on scales to plus or minus one percent of the designated weight. If the Engineer allows bag cement, proportion the batch to use only whole bags.
2. **Aggregates.** Weigh all aggregates on scales to plus or minus two percent of the designated weight. Apply the proper corrections for aggregate surface moisture.
3. **Water.** Measure water by volume or weight to within plus or minus one percent.
 - a. Construct the measuring system to be independent of water pressure fluctuation.
 - b. Ensure that measuring systems have outside taps and valves to facilitate plant calibrations.
 - c. You may use recycled wash water provided that it meets the requirements of Subsection 880.2.02.
4. **Admixtures.** Measure admixtures by weight or volume within plus or minus three percent of the required amount.

B. Control Concrete Batching

Control batching as follows:

1. Mix batches of concrete according to the proportions of an approved mix design.
2. Ensure that concrete materials are from the designated sources.
3. Correct the batch weights to account for surface moisture in aggregates.
4. Conduct batching control tests according to the procedures in the Sampling, Testing, and Inspection Manual.

C. Prestressed Concrete Deck Panel Requirements

Do not use prestressed concrete deck panels unless approved by the Engineer.

D. Add Admixtures to Concrete

Additives are required when specified herein or as directed by the Engineer.

1. Air-Entraining Admixtures

- a. All bridge structure concrete uses air-entraining additives, except for seal concrete and non-exposed footings.
- b. The Contractor may use air-entraining additives in other concrete to improve workability when job or material conditions dictate.

When using air-entraining additives as an option to improve workability or when required, do not exceed the upper limit of the entrained air content requirement in the Table 1—Concrete Mix Table .

2. Retarding Admixtures

Use concrete-retarding additives in bridge concrete when the average temperature is above 65 °F (18 °C) (the average of the expected high and the predicted low).

- a. Normally, concrete-retarding additives are not required for bridge curbs, handrails, crosswalks, or other appurtenances constructed separately from the decks.
- b. The Engineer may waive the use of retarders in substructure concrete when concrete can be placed within one hour after batching.

3. Water-Reducing Admixtures

The Contractor may use water-reducing admixtures in Class AA concrete for bridge decks when conditions do not require a retarder. The Contractor may use water-reducing admixtures in other concrete when job or material conditions dictate a reduction in water requirements or when minimal set retardation is desired.

The laboratory may allow Type F water-reducing admixtures when the Contractor requests it. The Contractor may construct bridge sections containing duct enclosures for stressing tendons with concrete using Type F (AASHTO M 194) water reducer as approved by the laboratory.

4. Fly Ash

The Contractor may use fly ash as an additive in concrete to promote workability and plasticity. The Contractor may use fly ash as a partial replacement for Portland cement in concrete if the following limits are met:

- a. Replace no more than 15 percent of the cement by weight.
- b. Replace cement with fly ash at the rate of 1.0 to 1.5 lbs (1.0 to 1.5 kg) of fly ash to 1.0 lb (1.0 kg) of cement.
- c. Ensure that the fly ash mix meets the requirements of Subsection 500.1.03.A, Subsection 830.2.03, [“Portland Pozzolan Cement”](#) and Subsection 831.2.03.A, “Fly Ash”.
- d. Calculate water-cement ratio based on the total cementitious material in the mix including fly ash.
- e. Do not use Type IP cement in mixes containing fly ash.

5. Granulated Iron Blast-Furnace Slag

If high-early strengths are unnecessary, the Contractor may use granulated iron blast-furnace slag as a partial replacement for Portland cement in concrete if the following limits are met:

- a. Replace no more than 50 percent of the cement by weight.
- b. Replace the cement with slag at the rate of 1.0 lb (1.0 kg) of slag to 1.0 lb (1.0 kg) of cement.
- c. Ensure that the slag mix meets the requirements of Subsection 500.1.03.A.3, Subsection 830.2.02, [“Portland Blast-Furnace Cement”](#) and Subsection 831.2.03.A.3, “Granulated Iron Blast-Furnace Slag”

- d. Calculate the water-cement ratio based on the total cementitious material in the mix including granulated iron-blast furnace slag.
- e. Do not use Type IP cement or fly ash in slag mixes.

E. Mix Concrete

1. Central-Mixed Concrete

Mix central-mixed concrete as follows:

- a. Establish the mixing time.

The Engineer will determine the mixing time for central mixed concrete, but the minimum mixing time will be one minute for stationary mixers of up to 1 yd³ (1 m³) capacity. Mixing time may be adjusted in the following situations:

- The Engineer will increase the minimum time by 15 seconds for each additional cubic yard (meter) or fraction thereof.
- For mixers with a capacity above 3 yd³ (2 m³), the minimum mixing time may be 90 seconds if the resulting mixture is homogeneous and meets the requirements of Subsection 500.3.02.D.1.c, "Mixer Performance Test."
- The Engineer may waive mixing time requirements for stationary mixers of improved types or new designs that produce homogeneous concrete in less time than that established for a particular capacity by the foregoing. For these types of mixers, the Engineer may establish a minimum mixing time of one minute.

- b. Start the mixing time when all cement and aggregates have been placed in the mixer.
- c. Add some water to the mixer before adding the cement and aggregates, but ensure all water is in the mixer by the end of the first 1/4 of the specified mixing time.

2. Shrink-Mixed Concrete

Mix shrink-mixed concrete as follows:

- a. Mix the batches as specified in Subsection 500.3.02.D.2."Mixers and Agitators."
- b. Do the initial mixing in a stationary mixer for at least 30 seconds to thoroughly mix the ingredients. Do the final mixing in truck mixers.
- c. Discharge all concrete before the drum or blades exceed 300 revolutions.
- d. Do not allow truck mixing at mixing speed to exceed 100 drum or blade revolutions except as allowed when adding water according to Subsection 500.3.05.M, "Add Water to Concrete."

3. Transit-Mixed Concrete

Mix transit-mixed concrete as follows:

- a. For concrete mixed completely in a truck mixer, place all concrete ingredients into the mixer at the concrete plant except the quantity of water that may be withheld according to Subsection 500.3.05.M, "Add Water to Concrete."
- b. After loading the truck, begin operating at either agitating or mixing speed; however, start the mixing speed within 30 minutes after loading the truck mixer.
- c. Mix the concrete for 70 to 150 revolutions at mixing speed.
For revolutions above those specified for mixing speed, use agitating speed.
- d. Discharge all concrete before exceeding 300 drum or blade revolutions.

4. Colored-Mixed Concrete

- a. Proportion, batch and mix color additives in accordance with manufacturer's instructions. Mix until color additives are uniformly dispersed throughout mixture and disintegrating bags, if used, have disintegrated.
- b. If mixed at batch plant, schedule delivery of concrete to provide consistent mix times from batching until discharge.

F. Concrete Used in Construction

1. Requirements

Use Type I or Type II Portland cement or Type IP Portland-Pozzolan cement for bridge construction, unless otherwise specified.

NOTES:

- 1. Do not use air-entraining cement.**
- 2. Do not use accelerators (24-hour accelerated strength concrete) that contain chlorides in any bridges where the concrete containing the additive will contact the reinforcing steel.**

a. Concrete Types: Use the tabulated results from the Table 1—Concrete Mix Table for the classes and specific requirements for each class of concrete. Use the appropriate class of concrete shown in the Plans or Specifications for each component of a structure, of the type as follows:

- Class AAA—Prestressed concrete
- Class AA1—Precast concrete as called for on the Plans

If approved by the Engineer, you may use this class as high early-strength concrete and may use Type III cement in concrete used for this purpose.

The Engineer may also specify the rate of compressive strength development when this concrete is used

NOTE: The Department will not add compensation to the Contractor for Class AA1 concrete when it is used at the request of the Contractor.

- b. Class AA—Bridge superstructure concrete or precast concrete as called for on the Plans
- c. Class A—General purposes

NOTE: Do not air-entrain Class A concrete deposited in water (seal concrete). Ensure that the concrete has 10 percent additional cement and sufficient water to provide a 6- to 8-in (150- to 200-mm) slump.

- d. Class B—Massive sections or lightly reinforced sections or miscellaneous non-structural concrete
- e. Class CS—(Portland cement concrete subbase). Use this class as a subbase where required by the Plans. Concrete subbase may be composed of a mixture of Portland cement and graded aggregate or Portland cement, aggregate, and sand.

2. Acceptance of Design

Determine laboratory acceptance strength by at least 8 compressive test specimens prepared and cured according to AASHTO T 126.

- a. Make the specimens from two or more separate trial batches.
- b. Make an equal number of specimens from each batch.
- c. Calculate the minimum average strength or acceptance strength (X) as follows:

$$X = f'c + 2.0s$$

Where:

$f'c$ = required minimum compressive strength for each class of concrete from the Table 1—Concrete Mix Table

s = average standard deviation of all 28-day specimens made in the field representing concrete of a given class from all ready-mix plants

Use the standard deviations shown in Table 4:

Table 4—Standard Deviations for Calculating Acceptance Strength

Class of Concrete	Standard Deviation (s)	
	Psi	(MPa)
B	370	(2.5)
A	650	(4.5)
AA	620	(4.3)
AA1	540	(3.7)
AAA	500	(3.4)

500.3.05 Construction

A. Meet General Responsibilities

General construction responsibilities include:

1. Batch, mix, deliver, and place concrete according to the Specifications.
2. Have enough production and placement capacity to continuously mix, place, and finish the concrete in each pour unit during daylight hours.
If necessary, place concrete at night when adequate lighting facilities exist and the Engineer approves of the operations and facilities.
3. If a pour cannot be completed, do the following:
 - a. Form an approved construction joint.
 - b. Remove the partial pour.
 - c. Take other remedial measures directed by the Engineer at no additional expense to the Department.
4. Schedule placement to minimize exposure of freshly poured concrete to potentially harmful drying elements such as wind and sun before curing materials are applied and protect freshly poured concrete from exposure to excess moisture and freezing for a minimum of 24 hours when such weather conditions exist.

B. Construct Falsework

Accept responsibility for the design, construction, protection, and performance of falsework. Repair or remove and replace (as the Engineer directs) concrete, other material, or portions of the structure that are damaged or destroyed due to falsework failure.

Construct falsework for prestressed post-tensioned concrete structures according to the Contract Special Provisions.

Construct falsework for structures other than post-tensioned box girders as follows:

1. Meet Design Criteria

Ensure that falsework structural components that have similar functions in an individual permanent span have the same geometric properties and are made of the same materials.

When designing and centering formwork, treat concrete as a liquid, and use the following weights:

- 150 lbs/ft³ (23.6 kN/m³) for vertical loading
- 85 lbs/ft³ (13.4 kN/m³) for horizontal loading
- 75 lbs/ft² (3.6 kN/m²) live load for deck placement operations

Use the following falsework design criteria:

- Design and construct falsework logically so the Bridge Design Office can analyze it using a commonly accepted structural design theory.
- Avoid exceeding safe working values for material stresses.

- Provide support for the imposed loads, without settling or deforming and a way to compensate for settlement, if it occurs.
2. Support Falsework
Support falsework using one of these methods:
 - Support on piling driven and removed as directed
 - Found on a footing approved by the Engineer
 3. Construct Falsework
Construct and set falsework to provide the finished structure the specified camber and finished grade.
Place “telltales” at locations directed by the Engineer to observe how much the falsework settles.

C. Meet Form Design Criteria

Ensure that forms meet the following design criteria:

- Provide wet concrete and other loads and forces of construction support without bulging between the supports or bracing and without deviating from the lines and contours shown on the Plans.
- Meet the design criteria for falsework in Subsection 500.3.05.B.1, “Meet Design Criteria.”
- Account for the use of retarded concrete.

Ensure that bracing, ties, and supports are placed accurately.

If the formwork appears to be inadequately supported, tied, or braced (before or during concrete placement), the Engineer may require that the Work stop until the defects are corrected.

D. Use Acceptable Form Materials

Except as noted, fabricate forms from the following materials:

- Lumber
- Plywood
- Metal
- Plastic
- Combinations of these

Use material free of defects that materially affect form strength or materially impair the accuracy or appearance of the concrete surface.

Use the form materials as follows:

1. Lumber Forms
Construct wood forms as follows:
 - a. Size and dress the lumber.
 - b. Use lumber at least 1 in (25 mm) thick.
 - c. Use lumber for header forms used as screed supports and for curb face forms at least 2 in (50 mm) thick.
 - d. Avoid using scrap material or doing patchwork.
 - e. Stagger all joints but those between abutting panels.
 - f. Line the lumber used to form outside vertical surfaces of exterior beams or girders with an approved form liner.
 - g. Use chamfer strips mill-produced from high-quality lumber, free of defects.
 - h. Dress and finish chamfer strips on all three sides.
 - i. Size chamfer strips to the proper dimensions.
2. Plywood Forms
Construct plywood forms as follows:

- a. If plywood is the type made for general concrete forms and is at least 5/8 in (16 mm) thick, use it in place of 1 in (25 mm) thick lumber to construct forms, if necessary.
- b. Ensure that plywood used to form open joints and to line forms is at least 1/4 in (6 mm) thick.
- c. When nailing plywood directly to form studs, do not space the studs more than 16 in (400 mm) apart.
- d. Use plywood in full sheets wherever practical. Do not do patchwork with small, irregular pieces.
- e. Have the Engineer inspect and approve plywood sheet layout.

3. Metal or Plastic Forms

Construct metal or plastic forms as follows:

- a. Use metal or plastic to form concrete only if the Engineer approves the forms and if the forms produce satisfactory results.
- b. Use metal forms that produce finished concrete equal to or superior to concrete made from comparable wooden forms.
- c. Countersink bolts and rivets in the surfaces of metal forms that touch concrete.
- d. Grind welds smooth in the surfaces of metal forms to provide a smooth plane surface.

4. Other Material Uses

Use tempered fiberboard for form liners when necessary if it is at least 1/4 in (6 mm) thick. Use tempered fiberboard 1/8 in (3 mm) thick only to form open joints. Support the fiberboard with suitable spacers arranged properly.

Use approved synthetic materials for forming open joints and for other special uses, if necessary.

E. Construct Form Supports

Construct form supports using metal ties, anchors, and hangers as follows:

1. Construct supports that will remain in the finished concrete so they can be removed from the concrete face to a depth of at least 1 in (25 mm) without damaging the concrete.
2. Weld form supports to girder or beam flanges in continuous or cantilever spans only in the flange areas which are in compression.
3. When ordinary wire ties or snap ties are permitted, cut them back at least 3/8 in (10 mm) from the face of the concrete.
4. Design metal tie fittings that minimize the cavities made when they are removed. Fill all cavities after removing metal tie fittings.

F. Construct Temporary Forms

Construct temporary forms as follows:

1. Construct and maintain forms in a mortar-tight condition.
2. Construct forms so that they can be removed easily without damaging the concrete, unless using forms that will remain in place.
3. Build, line, and brace forms so that the formed concrete surface conforms with the dimensions, lines, and grades shown on the Plans.
4. Build headwall forms for skewed pipe parallel to the roadway centerline or at right angles to the radius on curves. Construct headwall forms as follows:
 - a. Lay enough pipe to extend through the headwall form.
 - b. After the concrete is poured and hardened, carefully cut and dress the protruding pipe ends so no ragged edges remain.

The Contractor may choose, as an alternate to the above method, to build a circular form that exactly fits the pipe circumference and face of the headwall form.

5. Construct form liner using plywood or other approved form liner as follows:
 - a. Use form liner in large sheets. Do not do patchwork.

- b. Avoid irregular joint location in form liners.
- c. Have the Engineer inspect and approve the proposed liner layout.
6. Bevel forms at beam copings, girders, and other projections to ease removal.
7. Place chamfer strips to chamfer exposed edges of the concrete by the required amount. Use $\frac{3}{4}$ in (19 mm) chamfers unless otherwise shown on the Plans.
8. Patch with tin or other metal only in those areas of the superstructure lying between and including the inside faces of the exterior beams.
9. When shown on the Plans, splice water stops to form continuous water-tight joints. Hold stops in position while placing concrete.
10. Immediately before erecting forms or just before placing bar reinforcement steel, coat forms with a clear oil or other bond breaker to keep concrete from sticking to the forms.
 - a. Do not allow the substance to stain or soften the concrete surface.
 - b. Do not apply by reaching or pouring through previously placed reinforcement steel.
11. Wait to place concrete in any form until the Department inspects and approves the form.

Inspection and approval does not diminish the responsibility to produce concrete surfaces free of warping, bulging, or other defects.
12. When removing forms, remove chamfer strips, blocks, and bracing.
13. Do not leave any part of a wooden form in the concrete.
14. If concrete surfaces do not meet finish specifications, correct the problems with the following steps, as directed by the Engineer:
 - Repair the defects using approved methods.
 - Remove and replace the affected portion of the Work.

G. Reuse Forms

Reuse forms and form material in good condition and satisfactory as determined by the Engineer. Do not use forms or form materials that are warped, cracked, split, bulging, have separated plies, or have unsatisfactory form liner.

Ensure that used forms are mortar tight and produce a finished concrete equivalent to that produced by new forms.

H. Construct Permanent Steel Bridge Deck Forms for Concrete Deck Slabs

Unless otherwise designated on the Plans, construct and use permanent steel bridge deck forms for concrete bridge deck slabs according to these Specifications. Do not use permanent steel bridge deck forms in panels where longitudinal deck construction joints are located between stringers.

Provide a structurally satisfactory slab when using permanent steel bridge deck forms.

1. Fabricate permanent steel bridge deck forms and supports from steel that conforms to ASTM A 653/653M Designation SS, Grade 80/550, Coating Designation G-165/Z-500 and ASTM A 924/924M.
2. Design permanent steel bridge deck forms as follows:
 - a. Account for the dead load of the following:
 - Form
 - Reinforcement steel
 - Plastic concrete
 - b. Add 50 lbs/ft² (2.4 kN/m²) for construction loads.
 - c. Ensure that the unit working stress in the steel sheet does not exceed 0.725 of the specified minimum yield strength for the material furnished. However, do not allow the unit working stress to exceed 36,000 psi (250 MPa).
 - d. Account for deflection under the weight of the forms, the plastic concrete, and the reinforcement as follows:

- 1) If deflection exceeds 1/180 of the design span or 1/2 in (13 mm), whichever is less, use intermediate supports.
- 2) Do not base deflection on a total load of less than 120 lbs/ft² (5.7 kN/m²).
- e. Base the permissible form camber on the actual dead load condition.
- f. Do not use camber to compensate for deflection that exceeds the above limits.
- g. Compute the form sheets design span using the clear span of the form, plus 2 in (50 mm), measured parallel to the form flutes.
- h. Compute physical design properties according to the requirements of the latest published edition of the American Iron and Steel Institute Specification for the Design of Cold Formed Steel Structural Members.
- i. Ensure that all bottom reinforcement has a minimum concrete cover of 1 in (25 mm) as shown in Figure 1 (Figure 1 metric).

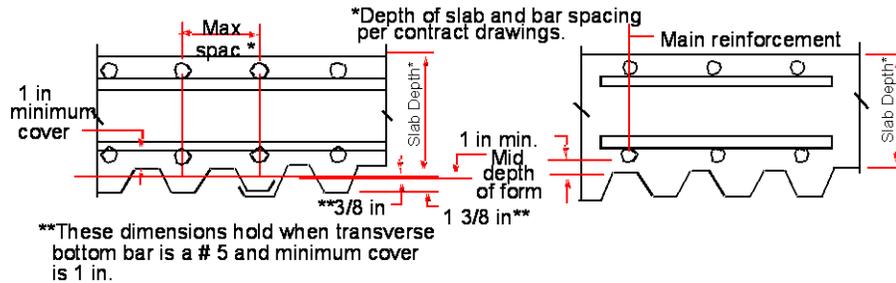

Figure 1

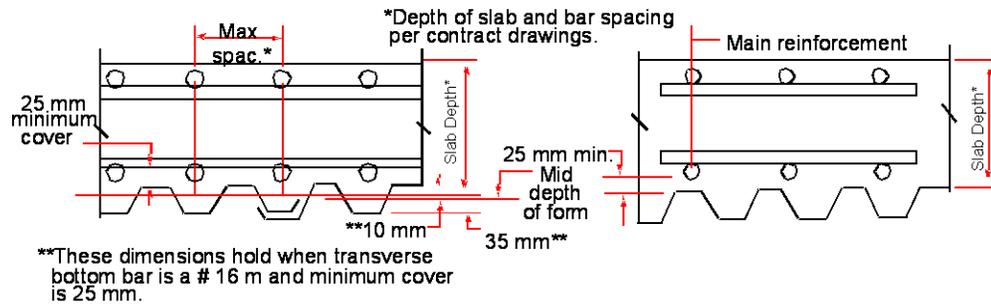

Figure 1 (metric)

- j. Maintain the Plan dimensions of both layers of primary deck reinforcement from the top surface of the concrete deck.
 - k. Do not use precast mortar blocks to support the deck reinforcement.
 - l. Do not treat permanent steel bridge deck forms as lateral bracing for the compression flanges of supporting structural members.
3. Do not weld to flanges in tension or to structural steel bridge elements fabricated from non-weldable steel grades. Have welders certified by the Department weld metal deck forms or supports for metal deck forms.

I. Install Forms

Install and maintain forms in a mortar-tight condition and according to approved fabrication and erection Plans.

Place transverse construction joints at the bottom of a flute. Field drill 1/4 in (6mm) weep holes no less than 12 in (300 mm) on center along the line of the joint.

1. Highway Bridge Forms

Install highway bridge forms using either Method 1 or Method 2:

- **Method 1.** Place forms so the ribs of the forms align with how the bottom transverse reinforcing in the slab is spaced.
- **Method 2.** Place forms with a 1 in (25 mm) minimum clearance between the top of the form and the bottom of the main deck reinforcement. See Figure 1 (Figure 1 metric).

2. Railroad Bridge Forms

Install railroad bridge forms as follows:

- a. Place the forms so the tops of the form ribs adjacent to the beam flange are at the bottom of the deck slab specified by the Plans.
- b. Maintain the full slab depth detailed on the Plans.
- c. Do not allow form ribs to project above the Plan bottom of the deck slab.
- d. Do not place form sheets directly on top of the stringer or floor beam flanges.
- e. Securely fasten form sheets to form supports using self-drilling screw fasteners, not by welding. If the Engineer approves, use fastener pins driven into place by a power tool.
- f. Ensure that form sheets have a minimum bearing length of 1 in (25 mm) at each end.
- g. Do not leave loose sheets or accessories on the deck at the end of a day's work.
- h. Place form supports so that they contact the flange of the stringer or floor beam.
- i. Attach form supports using welds, bolts, clips, or other approved means.
- j. Do not weld form supports to the flanges of non-weldable steel or to portions of the flange subject to tensile stresses.
- k. Ensure that welding and welds comply with AWS D 2.0 for fillet welds. However, 1/8 in (3 mm) fillet welds are permitted.

J. Repair Damaged Forms

Repair permanently exposed form metal to the Engineer's satisfaction if the galvanized coating is damaged.

1. Clean the damaged area.
2. Go over the damaged area with a wire brush.
3. Paint the area with two coats of zinc oxide-zinc dust primer that meet Federal Specification TT-P-641d, Type II and has no color added.
4. Do not touch up minor heat discoloration in weld areas.

K. Construct Runways

Provide runways into a deck pour area for moving buggies. If the Engineer approves, use runways to bridge a previous pour that has not reached the minimum strength or age requirements in Subsection 500.3.05.AF.4, "Live Loads—Pouring Equipment."

Construct and support runways to protect the forms and the reinforcement steel position.

L. Construct Work Bridges

Provide a work bridge on deck pours. Support the bridge outside the area of the pour receiving a surface finish. If two or more spans will be poured on the same day, the Engineer may require two work bridges.

Design and construct work bridges to meet the following:

- Do not allow the bridge to sag into the fresh concrete.
- Construct the bridge so that transverse finish and curing material can be applied easily regardless of the screed type.

M. Add Water to Concrete

Add water to the concrete at the concrete plant. Do not add indiscriminate amounts of water at the job site.

If placement conditions require concrete of a more workable consistency, add small amounts of water at the job site if approved by the Engineer.

Add water at the job site as follows:

1. Determine the quantity of water required to provide the necessary consistency.
The Engineer will not approve additions of water that cause the total amount of water to exceed the maximum water/cement ratio established in the Table 1—Concrete Mix Table .
The Engineer will reject concrete with water added to it that produces a higher slump than specified in the Table 1—Concrete Mix Table .
2. Do not add water to concrete that has begun to set because of excessive mixing or to concrete that has exceeded mixing or haul time limitations.
3. When adding the water, carefully control the conditions.
4. Position the delivery so the measuring operation is not affected.
5. Measure the water carefully.
6. Inject the water into the mixer forcefully to facilitate uniform mixing.
7. Add water before discharging an appreciable amount of concrete.
8. Do not add more water after concrete discharge begins.
9. After adding the water, mix the concrete an additional 30 revolutions.
10. Finish mixing the concrete before the total revolutions at mixing speed exceed 150.

N. Volumetrically Proportion Concrete

Concrete ingredients may be proportioned volumetrically when non-air entrained concrete is used in miscellaneous concrete, non-exposed footings, or culverts smaller than bridge culvert size.

O. Prepare for Concrete Placement

Prepare for concrete placement as follows:

1. Ensure that an adequate supply of concrete will be furnished and placed to meet the requirements specified in Subsection 500.3.05.P, Table 5—Minimum Placement Rates.
2. To ensure a full bond between prestressed concrete deck panels and the cast-in-place concrete, clean the panel before placing the slab concrete.
3. Immediately before placing cast-in-place slab concrete, saturate the prestressed concrete deck panels with water.
4. Immediately before placing concrete in the forms, the concrete will be measured for acceptance tolerances. Acceptance tolerances for each class of concrete are listed in the Table 1—Concrete Mix Table .
Conduct the applicable tests according to the procedures in the Sampling, Testing, and Inspection information.

P. Meet the Minimum Placement Rates

If concrete is not produced, placed, and finished according to the minimum placement rates, the Engineer may reject the pour. Concrete pours of a similar nature and size will not be allowed until the problem is corrected and the placement rate met.

The minimum placement rates are listed in Table 5:

Table 5—Minimum Placement Rates for Bridges, Culverts and Retaining Walls

1. Bridge Substructure

Pour Size in Cubic Yards (Meters)	Minimum Placement Rate in Cubic Yards (Meters) per Hour
0-25 (0-19)	10 (8)
26-50 (20-39)	15 (12)
51-75 (40-59)	20 (15)
76-100 (60-75)	25 (20)
101 and over (76 and over)	30 (25) or as designated on the Plans or in the Special Provisions

The minimum placement rate for columns shall be the same as for culvert sidewalls and wingwalls.

2. Bridge Superstructure

Pour Size in Cubic Yards (Meters)	Minimum Placement Rate in Cubic Yards (Meters) per Hour
0-25 (0-19)	15 (12)
26-50 (20-39)	20 (15)
51-75 (40-59)	25 (20)
76 and over (60 and over)	30 (25) or as designated on the Plans or in the Special Provisions

Pour handrail, parapet, curb, and barriers at a rate satisfactory to the Engineer.

3. Culverts

Structure	Minimum Placement Rate in Cubic Yards (Meters) per Hour
Footings and slabs	Same as for bridge substructures
Sidewalls and wingwalls	Use placement rates so that fresh concrete is not placed on concrete that has attained its initial set. Cover all concrete with fresh concrete within 45 minutes.

4. Retaining Walls

Structure	Minimum Placement Rate in Cubic Yards (Meters) per Hour
Footings	Same as for bridge substructures
Walls	Same as for culvert sidewalls and wingwalls

Q. Place Concrete

Place concrete as follows:

1. Do not allow aluminum to touch the concrete while mixing, transporting, handling, or placing it.
2. Transport, handle, and place concrete quickly so that it reaches its final position in the forms within the haul time limitations in Subsection 500.2.01.E.1, "Haul Time Limitations."
3. Manipulate the delivery or conveyance unit to avoid vibration damaging to partially set concrete.
4. Immediately before placing the concrete, thoroughly clean and wet the forms.
5. Place concrete as close as possible to its final position in the forms.
6. Use chutes, troughs, or tubes to pour the concrete in the forms, without displacing reinforcement steel.
7. Modify or stop using the equipment if chutes, troughs, or tubes cause honeycombed or otherwise inferior concrete.
8. When placing concrete by pumping, operate the pumping equipment so that the concrete is produced in a continuous stream without air pockets.

NOTE: Convey and place concrete by pumping only when specified in the Contract or when authorized by the Engineer.

9. When concrete placement requires dropping the concrete more than 5 ft (1.5 m), use pipes or tubes to place the concrete.
Do not allow concrete to free-fall more than 5 ft (1.5 m) from the pipe or tube.
10. Place concrete in horizontal layers no more than 18 in (0.5 m) thick.
11. Place and compact succeeding batches in each layer before the preceding batch takes its initial set.
12. Place each succeeding layer before the underlying layer sets.
13. Consolidate the concrete to avoid cold joints between layers.
14. If the forms sag or bulge while concrete is being placed, remove the concrete causing the distortion and the concrete in adjoining areas if the Engineer requires. Removal prevents cold joints and displaced or damaged reinforcement.
15. Work the concrete around reinforcement bars without displacing them.
16. Compact concrete using suitable tools and vibration.
17. Vibrate concrete where it is deposited and vibrate other concrete while it is fresh. Vibrate as follows:
 - a. Insert and withdraw vibrators slowly.
 - b. Manipulate vibrators to work the concrete around reinforcement and embedded fixtures and into corners of forms.
 - c. Vibrate sufficiently to compact the concrete but avoid causing the concrete to segregate.
 - d. Stop vibrating before local areas of grout are formed.
 - e. Apply vibrators no farther apart than twice the radius through which the vibration is visibly effective.
 - f. Do not use vibrators or any other means that could cause segregation to move masses of concrete in the forms.
 - g. Do not apply vibrators to sections of concrete that are no longer plastic.
 - h. Vibrate concrete-filled steel grid floors by applying the vibrators to the steel.
 - i. Vibrate concrete for precast or prestressed units as specified above in steps a through g, unless the Engineer approves alternate methods.
 - j. Stop vibration when a mortar line appears on the face of the form and when the coarse aggregate particles are submerged in the concrete mortar.
18. Supplement vibration with spading to ensure smooth surfaces and dense concrete along form faces and in locations difficult to reach with vibrators.
19. After concrete sets initially, do not disturb the forms or the projecting reinforcing bars.

R. Create Construction Joints

Place construction joints according to the Plans or as directed by the Engineer.

If an emergency affects continuous placement, the Engineer will decide if a construction joint is allowed. If allowed, the Engineer will provide instructions about where and how to make the joint.

The Engineer may eliminate certain construction joints if placement, finishing and forming methods can produce satisfactory results.

Create construction joints as follows:

1. Remove mortar splashed on form surfaces and projecting reinforcement steel before concrete reaches its initial set.
 - a. Do not puddle dried mortar chips and dust into the plastic concrete.
 - b. If excess mortar is not removed from reinforcement steel before the concrete reaches its initial set, delay cleaning until the concrete is thoroughly hardened.
2. If joining fresh concrete and hardened concrete, clean the hardened surface of laitance and incompletely bonded, loose, or foreign material.

Ensure that laitance is completely removed from the following:

- Joints between decks and curbs
 - Tops of seal courses
 - Construction joints in concrete exposed to sea water
3. Ensure that the surface of the concrete is dry before pouring the concrete against it.
 4. Immediately before placing fresh concrete, tighten the forms against the existing concrete.
 5. Use tremies or pumps to coat areas where fresh concrete will be poured with mortar or cement grout.
 6. Begin placing concrete immediately after placing the mortar or grout.
 7. Apply enough vibration to blend the material with the concrete at the construction joint.

S. Protect Fresh Concrete

Do not drive pile, blast, or perform other operations that vibrate the formwork or the concrete noticeably before the concrete reaches a strength of 2,000 psi (15 MPa) and is 3 days old.

Protect fresh concrete from rainfall with waterproof material such as tarpaulins or plastic film. Ensure that the waterproof material is ready before pouring and is sufficient to cover the area of the pour.

T. Place Bridge Deck Concrete

Do not use calcium chloride or any other admixture containing chloride salts in concrete placed on permanent steel bridge deck forms.

Ensure that the tolerances are accurate for bar reinforcement placement in cast-in-place concrete so the top clearance to the bar reinforcement complies with Subsection 511.3.05.G.6, "Bridge Deck Slab Tolerances."

Place bridge deck concrete according to the Contract Specifications and as follows:

1. Before pouring decks, set substantial bulkheads or headers and shape them to the required deck surface cross section.
 2. Ensure that pouring sequences, procedures, and mixes comply with the Plans and Specifications.
 3. Pour the deck according to the numbered sequence as follows:
 - a. Unless otherwise shown on the Plans, pour each deck in one continuous operation.
 - b. When dividing deck pours within any one complete unit (a simple span or a continuous or cantilever unit), pour and finish the concrete in the numbered sequence shown on the Plans, beginning with the lowest number.
 - c. Make pours with the same number before pours with higher numbers. Make pours with the same number in any sequence.

The numbered sequence shown on the Plans also applies to sidewalk pours, but it need not apply to curb, parapet, and handrail pours.
 - d. Pour diaphragms between steel or prestressed concrete roadway beams at least 24 hours before pouring the deck slab.
 - e. Unless otherwise authorized by the Engineer, pour all diaphragms within a complete unit before pouring decks.
 - f. When constructing concrete T-Beams, place girder stems in uniform layers before placing slabs.
 - g. If T-Beam spans are supported without intermediate false bents, begin deck placement as soon as the first four stems are placed. After the first four stems, avoid getting more than three stems ahead of the advancing line of the deck pour and lagging by more than the space between stems.
 - h. If T-Beam spans are supported by intermediate false bents, place decks and stems the same as for T-Beam spans supported without intermediate false bents. However, ensure that the slab is placed before a cold joint develops between the stem and slab.
 4. Do not make the deck pour until any previously poured concrete in the complete unit has set for 24 hours.

This requirement may be waived under certain conditions if the succeeding pour can be completed (except for final finishing) within four hours of the initial placement of the day. The Engineer must give written approval for this requirement to be waived.
-

Unless otherwise shown on the Plans, do not place handrail, sidewalks, parapets, and curbs in a complete unit until all the deck slabs in the unit have been poured.

5. Ensure that the pour is the same as the overlap direction (as shown in the shop drawings).
 6. Use the following deck pour method:
 - a. If there is super-elevation, begin deck pours on either the high or the low side.
 - b. Dump each batch against previously placed concrete.
 - c. Pour at a rate that ensures fresh concrete along the advancing line of the pour.
 - d. Vibrate or tamp concrete dumped on fresh concrete to make the grout flow as follows:
 - Forward with or slightly ahead of the concrete
 - Along the bottoms and sides of the forms
 - Around the reinforcement steel
 7. Once the concrete is poured, vibrate it enough to avoid honeycomb and voids, especially at the following locations:
 - Construction joints
 - Expansion joints
 - Valleys and ends of form sheets Screed the concrete as follows:
 - a. Use finishing devices operating parallel to the center line. As pouring proceeds, keep the concrete surface screeded to the required grade.
 - b. Fill depressions ahead of the screed, and keep a small roll of grout on the leading edge of the screed. Perform further screeding with minimum disturbance to the surface already brought to the grade.
 - c. Take care during the placement and screeding to obtain sound concrete at the construction joint located where the slab joins the curb, parapet, or sidewalk.
 - d. Do not place excess grout on the leading edge of the screed and do not allow it to remain in this area.
 - e. Use either a longitudinal screed or a transverse screed.
 - Longitudinal Screed
Before doing the final screeding, place enough concrete in front of the screeding position to deflect the dead load.
 - Transverse Screed
On beam or girder-supported spans with skew angles of 65° or less, place and operate the truss or beam supporting the strike-off parallel to the skew and make the advancing pour line parallel to the skew.
On beam or girder-supported spans with skew angles between 65° and 90° , position the screed either on the skew or at right angles to the bridge center line.
On superstructures supported by non-deflecting falsework and on beam- or girder-supported spans with a total dead load deflection no more than $1/2$ in (13 mm), position the screed at right angles to the bridge center line and make the advancing line of pour at right angles to the bridge center line.
 - f. As the pouring proceeds, keep the concrete surface screeded to the required grade.
 - g. Fill depressions ahead of the screed. Keep a small roll of grout on the leading edge of the screed.
 - h. Continue to screed without disturbing the surface already brought to the required grade.
 - i. Avoid producing unsound concrete where the slab joins the curb, parapet, or sidewalk. Remove excess grout from the leading edge of the screed at these construction joints.
8. Edge joints to be sealed, including dummy joints, as follows:
 - a. Edge before the initial set or after the final set.
 - b. If edging before the initial set, use edging tools of the proper radius as shown on the Plans.
 - c. Carefully remove concrete from pouring operations on adjacent pours to achieve the required rounded edge.
 - d. If edging after the final set, allow the joints to harden. After at least 12 hours, grind joints to approximate the plan radius either by hand or by mechanically operated grinding stones.
 - e. To achieve full and uniform bearing, finish areas that are recessed for receiving joint members.

9. Finish bridge decks as follows:
 - a. As soon as the concrete is hard enough and standing water and moisture sheen disappear, give the concrete a final finish by belting, brooming, or dragging.
 - Belt longitudinally using a wet canvas belt. Limit belting to spans no longer than 40 ft (12 m).
 - Drag transversely or longitudinally with a wet burlap drag.
 - Broom transversely using a stiff-bristled broom.
 - b. Finish the following areas carefully:
 - Gutter lines
 - Joints
 - Drains
 - c. After belting, dragging, or brooming and when shown on the Plans, groove the bridge deck and approach slabs perpendicular to the center line as follows:
 - 1) Do not begin grooving until the bridge deck is cured according to Subsection 500.3.05.Z, "Cure Concrete."
 - 2) If necessary, groove in conjunction with planing required to make the surface corrections specified in Subsection 500.3.06.D, "Bridge Deck Surface Check." Wait until the concrete is hard enough to support the equipment without distorting.
 - 3) Cut grooves into the hardened concrete using a mechanical saw device capable of producing grooves 0.125 in (3 mm) wide, 0.125 in (3 mm) deep, and 0.50 in (13 mm) apart, center-to-center.
 - 4) Extend the grooves across the slab to within 1ft (300 mm) of the gutter lines.

U. Place Concrete Parapet on Bridge Decks

Place concrete barrier or parapets on bridge decks. The slip form method with an approved self-propelled extrusion machine as specified in Section 621 is optional.

V. Place Seal Concrete

Deposit concrete in water only when required by the Plans or when considered necessary by the Engineer.

When depositing the seal concrete, follow these guidelines:

- Keep the water as motionless as possible.
- Place the concrete continuously from beginning to end.
- Ensure that the concrete surface remains as horizontal as possible.

Place seal concrete as follows:

1. Place seal concrete carefully in a compacted mass as near to its final position as possible using a tremie, a bottom dump bucket, or other approved means.
 - a. Use tremies to place seal concrete as follows:
 - 1) Support tremies so that the discharge end can move freely over the entire top surface of the work.
 - 2) Support tremies so that they can lower rapidly to stop or retard the flow of concrete.
 - 3) At the beginning of the work, close the discharge end to keep water out of the tube.
 - 4) Keep the tube sealed.
 - 5) Keep the tremie tube full to the bottom of the hopper.
 - 6) When dumping a batch into the hopper, induce concrete flow by slightly raising the discharge end and keeping it within the previously deposited concrete. This maintains a seal and forces the concrete to flow into position by hydraulic head.
 - b. Use bottom-dump buckets to place seal concrete as follows:
 - 1) Ensure that the bottom-dump bucket is level full.
 - 2) Open the bucket only when it rests on the surface that will receive the charge.

- 3) In lowering and raising the bucket, do not move the water unnecessarily.
- c. When approved by the Engineer, place seal concrete by pumping.
2. Wait at least 24 hours after placement to begin dewatering seal concrete, unless the Engineer determines a longer waiting period is necessary.
3. Remove laitance from the seal concrete before placing the footing.
4. Bore seals under spread footings the entire depth of the seal as specified for foundations in Subsection 211.3.05.C, "Boring of Foundations and Seals."
5. If laitance buildup on seals under spread footings exceeds 1/4 in/ft (20 mm/m) of seal depth, the Engineer may decide to core the seal to determine acceptability.
6. When placing concrete exposed to sea water, control the water content to produce concrete of maximum density and create construction joints and prepare their surfaces according to the requirements of Subsection 500.3.05.R, "Create Construction Joints."

W. Pour CS Concrete

Pour CS concrete as follows:

1. Meet CS concrete depth and surface finish requirements.
 - Ensure that the minimum depth is the same as shown on the Plans.
 - Do not vary the depth variation more than 1 in (25 mm).
 - Ensure that the surface finish is generally smooth and uniform.
 - Smooth or fill float marks, voids, and other deformities exceeding 1/2 in (13 mm) before placing approach slabs.
2. To prevent bonding:
 - a. Lay clean polyethylene sheeting uniformly over the CS concrete in the approach slab area before placing the slabs.
 - b. Use new, unused polyethylene sheeting free of holes, rips, and tears.
 - c. Use polyethylene bond-breaking material at least 8 mils (0.2 mm) thick with an overlap of at least 6 in (150 mm).
3. Maintain polyethylene sheeting in good condition throughout the construction process.
Repair or replace sheeting deemed unsatisfactory as directed by the Engineer.
4. Cure CS concrete with the polyethylene sheeting used for bond breaking.

X. Pour Concrete in Cold Weather

When pouring concrete in cold weather, keep the concrete temperature at the point of delivery at least 50 °F (10 °C). Do not use accelerator-containing chlorides.

Mix and pour concrete in cold weather as follows:

1. Keep concrete materials at the right temperatures.
 - Do not use materials in concrete mix that contain frozen lumps.
 - Do not incorporate water and aggregates into the mix with temperatures more than 150 °F (65 °C).
 - If aggregates or water temperatures are above 100 °F (40 °C), discharge the aggregates and water into the mixer and allow the temperatures to equalize before adding the cement.
 - Heat aggregate with steam, hot water coils, or other methods that do not damage the aggregates. Do not heat aggregates with direct flame.
2. Protect the poured-concrete.
 - Keep concrete above 50 °F (10 °C) for at least 72 hours after placement.
 - Protect concrete from freezing for 6 days after placement.

Y. Pour Concrete in Hot Weather

Reduce hazards and difficulties related to placing and finishing concrete in hot weather before pouring. The Engineer may require measures to prevent concrete workability reduction, losses from cement hydration, evaporation, drying, or elevated concrete temperatures.

1. Place Concrete

Cool forms and reinforcement with water immediately before placing concrete. Meet the minimum placement rates specified in Subsection 500.3.05.P, Table 5—Minimum Placement Rates.

2. Keep Concrete Cool

Keep concrete cool as follows:

- a. Keep the concrete used for construction at no more than 90 °F (32.2 °C) when measured at the point of discharge from the delivery unit.
- b. If the concrete temperature might exceed 90 °F (32.2 °C) during concrete placement, begin placement when the air temperature cools if the Engineer requires.
- c. Cool the aggregates by fogging or other means that do not affect moisture content.
- d. Use chipped or crushed ice in the mix as a portion of the mixing water on a pound (kilogram) basis. If using ice, ensure that the ice melts before the batch is discharged from the mixing unit.
- e. If necessary, cool water by refrigeration to provide a lower concrete temperature.

3. Finish Concrete

Do not “splash on” water to aid screeding or finishing operations.

For bridge decks, fog the surface when required, according to Subsection 500.3.05.Z.3, “Bridge Deck Curing.”

If needed, use wind screens to prevent thermal or shrinkage cracks caused by rapid concrete surface drying.

Z. Cure Concrete

Concrete curing is an integral part of the concrete placement operation. Improperly cured concrete will be considered defective.

If the Engineer determines that curing procedures do not comply with these Specifications, stop placing concrete. Resume concrete placement after taking remedial measures to ensure proper curing.

Begin curing unformed surfaces when the water sheen disappears from the surface or immediately after applying the surface finish. Continue curing for 5 days.

Cure the formed surfaces after removing the forms. Remove them within 5 days after placing concrete. Continue curing until the concrete is 5 days old (from the time it is poured).

Cure concrete surfaces exposed to air using methods that prevent premature drying or moisture loss. Ensure that curing conditions are the same throughout separate curing areas.

Use either or a combination of the two methods specified for curing concrete except bridge decks. Cure bridge decks as described in Subsection 500.3.05.Z.3, “Bridge Deck Curing.”

Cure colored concrete in accordance with manufacturer’s instructions.

1. General Curing—Supplying Additional Moisture

Do not use a method that causes the concrete to be alternately wet and dry.

Cure concrete properly by supplying additional moisture through ponding, sprinkling, or fogging and then retaining the moisture as follows:

- a. Use cotton mats, burlap, sand, hay, or straw coverings.
Cover with at least 2 in (50 mm) of sand. Cover with at least 3 in (75 mm) of hay or straw.
- b. Do not use sawdust or coverings that cause unsightly discoloration of concrete.
- c. Place coverings after completing the finishing operations when there is no danger of surface damage.

- d. Keep coverings moist continuously.
2. General Curing—Preventing Moisture Loss
- Keep concrete moist before and during the rubbing from the Type III—Rubbed Finish.
- Start curing immediately after the rub using approved waterproof paper, plastic sheets, or membrane-forming curing compounds, except when curing compounds are prohibited.
- a. Waterproof Paper or Plastic Sheets
- Ensure that the sheets and paper meet the requirements of AASHTO M 171 and use them as follows:
- Use the widest possible widths.
 - Lap adjacent sheets at least 6 in (150 mm).
 - Seal the laps with tape, mastic, glue, or other approved methods to form a waterproof cover of the entire area.
 - Keep the curing material from being displaced by wind.
 - Immediately replace or repair sheets or paper that tear, break, or become damaged during the curing period.
- b. Membrane-Forming Curing Compounds
- Use as the curing agent AASHTO M 148, membrane-forming curing compounds, Type 1-D, Class A or B, or Type 2, Class A or B, white pigmented. Use the curing agent as follows:
- Do not use membrane-forming curing compounds on bridge decks or prestressed concrete bridge members, or in construction joint areas.
 - When the water sheen disappears from the concrete surface, apply the curing compound uniformly to unformed areas.
 - Apply the compound to formed surfaces if the forms are removed during the 5-day curing period.
 - Cure the areas to be rubbed with liquid membrane-forming compounds for curing concrete, Type 1-D, Class A or B (non-acrylic).
 - Apply curing compound with fine-spraying equipment.
 - Thoroughly agitate the compounds just before using them.
 - Spray the surface again immediately after the first application at right angles to the first application.
- Apply at least 1 gal (1 L) for each 150 ft² (3.7 m²) of surface.
- Do not apply curing compound to the following:
 - Joints where a concrete bond is required
 - Reinforcement steel
 - Joints where joint sealer will be placed
 - Close the surface to pedestrian or vehicular traffic for 7 days unless the surface is protected by planks, plywood, or a layer of sand at least 1 in (25 mm) thick.
- Do not place this protection until at least 12 hours after applying the curing compound.
3. Bridge Deck Curing
- Cure bridge deck concrete as follows:
- a. Immediately after the water sheen disappears and the surface finish is applied, fog the surface to keep a film of water on the surface.
 - b. If surface damage occurs, delay fogging.
 - c. Keep the surface wet until after applying the sheet curing covers.
 - d. Thoroughly soak curing covers on the fabric side.
 - e. As soon as the concrete sets enough to prevent damage, apply the covers with the white-poly side up.
 - f. Use two-layer sheet curing material for bridge concrete according to AASHTO M 171.

For the bottom layer, use a polyethylene film. For the top layer, use a white, burlap polyethylene sheet or a white, co-polymer-coated, absorbent, non-woven synthetic fabric.

- g. Ensure that sheet curing material for bridge concrete meets Specification requirements for reflection and moisture retention and has no holes or tears.
 - h. Use enough sheet curing material to cover the deck surface.
 - i. Place the curing covers so that adjoining sheets overlap at least 18 in (450 mm).
 - j. Weight all laps and side edges to prevent cover displacement before curing is completed.
 - k. Weight and overlap covers so the curing sheets maintain intimate contact with the concrete surface.
 - l. If there is no moisture under the curing covers during the 5-day curing period, apply additional moisture.
4. Parapet, Sidewalk, End Post, and Curb Face Curing

The surface of parapets, sidewalk, end post, and horizontal and vertical faces of curbs are not considered part of the bridge deck. Cure these structures using the general curing methods in Subsections 500.3.05.Z.1, “General Curing—Supplying Additional Moisture,” and 500.3.05.Z.2, “General Curing—Preventing Moisture Loss,” unless the surfaces will receive a special surface coating (Subsection 500.3.05.AB.4, “Type III—Special Surface Coating Finish”).

Do not cure surfaces receiving a special surface coating with membrane-forming curing compounds.

Do not cure surfaces receiving protection surface treatment (75 percent boiled linseed oil and 25 percent mineral spirits solution) with membrane-forming curing compounds that contain acrylics.

AA. Prevent Plastic Shrinkage Cracking

Take precautions to prevent plastic shrinkage cracking of concrete by doing the following:

- Provide wind screens
- Provide fogging equipment
- Apply temporary wet coverings before moisture loss begins

The Engineer will evaluate the effects of plastic shrinkage cracks and will require repair of cracks that create structural defects and corrode reinforcement steel.

AB. Finish Concrete

Concrete surface finishes are classified according to whether the surfaces are formed or unformed. Refer to Table 6.

When other Sections of the Specifications for concrete work state that the requirements of Section 500 apply, finish the concrete according to the other sections.

Table 6—Concrete Finish Types

Surface	Finish Type
Formed	Type I—Ordinary Formed Surface Finish
	Type II—Special Formed Surface Finish
	Type III—Rubbed Finish
	Type III—Special Surface Coating Finish
Unformed	Type IV—Floated Surface Finish
	Type V—Sidewalk Finish
	Type VI—Stair Tread Finish

Except for bridge deck finishes, which are covered in Subsection 500.3.05.T, “Place Bridge Deck Concrete,” step 9, finish all structural concrete surfaces with one or more of the finishes described here, unless otherwise shown on the Plans.

1. Type I—Ordinary Formed Surface Finish

Complete formed concrete surfaces with this finish. However, leave concrete exposed directly to sea water undisturbed unless the Engineer requires additional work. See Subsection 500.3.05.V, “Place Seal Concrete,” step 6.

Achieve a Type I finish as follows:

- a. Immediately after removing the forms, remove fins and surface irregularities.
- b. Fill or point up the following:
 - Cavities produced by forms or ties
 - Holes
 - Broken corners or edges
 - Defects
 - Honeycombed edges
- c. Remove and patch honeycombed areas to sound concrete.
- d. Use patch mortar that consists of the same sand and cement as the concrete. Use the sand and cement in the same ratio as in the concrete.
Use epoxy mortars in areas where heat generation and moisture will not decrease patch performance.
- e. Cure the patches using one of the general curing methods specified in Subsection 500.3.05.Z.1, “General Curing—Supplying Additional Moisture” and 500.3.05.Z.2, “General Curing—Preventing Moisture Loss.”
- f. Produce a sound and uniform finish.
- g. If the Type I finish is not satisfactory, give the surfaces a Type III—Rubbed Finish where the Engineer considers it necessary to achieve a uniform and pleasing appearance.

2. Type II—Special Formed Surface Finish

Give a Type II finish to the following:

- Exposed portions of pipe headwalls and culverts
- Parapets and wingwalls
- Ends of culvert slabs and walls

Achieve a Type II finish as follows:

- a. Use a form liner unless the forms are made of plywood or steel.
- b. Rub only when necessary if the surface has a pleasing, uniform appearance after completing the Type I finish and blending all pointed and patched areas.
- c. If the surface finish is not satisfactory, give surfaces the Type III—Rubbed Finish where the Engineer considers it necessary to achieve a uniform and pleasing appearance.

3. Type III—Rubbed Finish

Apply a Type III finish to bridge areas checked in the table of Bridge areas Requiring a Type III Finish, below and to exposed areas of retaining walls, unless the Plans specify otherwise.

Achieve a rubbed finish as follows:

- a. Begin the first rub immediately after removing forms, completing the Type I finish, and ensuring that all patches are thoroughly set, but before applying the required curing compound.
If finishing is postponed or there is not enough labor to keep it up-to-date, the Engineer will order a stop to any other work until the finishing is satisfactory.
- b. Rub chamfered surfaces only once, but not during the first rubbing. Rub chamfered surfaces during either the second or the final rubbing.
- c. To rub, wet the moist concrete on the curing surface with a brush and rub with a medium-coarse carborundum stone or equal abrasive until a paste comes to the surface.
Keep the entire concrete surface moist during rubbing to assure adequate curing.

- d. Continue rubbing until all form marks and projections disappear, leaving a smooth, dense surface with no pits or irregularities.
- e. Spread the paste material carefully and uniformly over the entire surface and leave it.
- f. No earlier than 24 hours after the first rub, do the final rub with a fine carborundum stone or equal abrasive, leaving a smoothly textured surface that is uniform in color.
- g. Finish the final rub before applying protective surface treatment required by the Plans.
- h. Do not “whitewash” finished areas by using separately mixed grout or paste on the rubbing stone or by spreading it on the surface to be rubbed.
- i. Thoroughly clean and blend into the surrounding surfaces any areas that are disfigured by drips from concrete placement or rubbing.

Bridge Areas Requiring a Type III Finish (X)								
	Single Bridge Over Stream	Multiple Bridges Over Stream	Single Bridge Over Railroad	Multiple Bridges Over Railroad	Single Bridge Over Traffic Artery	Multiple Bridges Over Traffic Artery	Railroad Bridge Over Traffic Artery	Pedestrian Bridge Over Traffic Artery
All exposed substructure areas, except tops and bottoms of caps. (5)					X	X	X	X
Outside surface of any exterior concrete beam, Lt. or Rt. (1), (2)		X		X				
Outside surface of any exterior concrete beam, Lt. and Rt. (1), (3)					X	X	X	X
Vertical surfaces of overhangs, curb, or sidewalk.	X	X	X	X	X	X	X	X
All vertical surfaces outside of exterior beam, Lt. or Rt. (2)		X		X				
All vertical surfaces outside of exterior beam, Lt. or Rt. (3)					X	X	X	X
End bent cap beyond outside beam or girder.	X	X	X	X				
End bent end walls beyond outside beam or girder.	X	X	X	X	X	X	X	X
End posts and end bent wingwalls all exposed surfaces.	X	X	X	X	X	X	X	X
Traffic face of curbs.	X	X	X	X	X	X		X
Entire handrails and posts, hand rail parapet, and barriers. (4), (5)	X	X	X	X	X	X	X	X
All other locations specified on Special Provisions.	X	X	X	X	X	X	X	X

Notes:

- (1) —Including Prestressed Concrete Bridge Members.
- (2) —“Lt. or Rt.”—Rub the applicable surface when it can be seen from any adjoining bridge.
- (3) —“Lt. and Rt.”—Rub the applicable surfaces on both sides of centerline of each bridge.
- (4) —rubbing of bottom surface of rail not required.
- (5) —Bottoms of caps and handrails shall be given a Type II finish.

For bridges using PSC Beams or PSC Deck Units, a Type III Special Surface Coating Finish shall be used where a Type III finish is required for exterior beams. The Type III Special Surface Coating Finish shall also be used on the exterior vertical faces of the parapet, barrier, and overhangs where PSC Beams or PSC Deck Units are used.

4. Type III—Special Surface Coating Finish

A Type III—Special Surface Coating Finish may be substituted for a Type III—Rubbed Finish.

The special surface coating finish consists of either a Class A or a Class B coating system, applied to produce a masonry-like textured finish on concrete surfaces.

For contiguous structures, whether in the same Contract or in separate Contracts, use the same brand of special surface coating.

If contiguous structures are in separate contracts, coordinate the Work with the other Contractor so that coating is applied as near as possible to the same time.

If contractors cannot coordinate Work, the one who finishes the work last shall use the same brand or shall recoat all contiguous areas to provide a uniform appearance.

Achieve a special surface coating finish as follows:

- a. Ensure that surface coating material meets the requirements of Section 836.
Select coating material from the QPL 17.
 - b. Do not use form oils that affect the bonding of surface coatings.
 - c. Do not use wax-based or other curing compounds incompatible with surface coatings.
Have the coating manufacturer or the laboratory determine compatibility.
 - d. Use the coating color required in Section 836.
 - e. On surfaces that will receive a coating finish, do not cure with membrane-curing compound or remove forms with bond-breaking agents or excessive oil.
 - f. Apply coatings as follows:
 - Class A coatings at a rate that develops a 1/16 in (1.5 mm) thick coating.
 - Apply Class B coatings at a maximum rate of 60 ft² per gallon (1.5 m² per liter).
 - Ensure that the temperatures of the air, concrete, and compound are above 50 °F (10 °C).
 - Apply a test section as directed by the Engineer to determine the acceptance of a coating under field conditions.
 - Apply the coatings using a method that produces an acceptable finish, such as spraying, rolling, or a combination of these.
 - g. Protect coated surfaces from rain or freezing temperatures for 24 hours after application.
 - h. Ensure that the final coating produces a smoothly textured surface that is uniform in color, thickness, and appearance.
 - i. Remove and reapply coatings that chip, crack, blister, peel, or present an unsatisfactory appearance.
 - j. If the final appearance is unsatisfactory, apply a rubbed finish to slip-formed and formed walls and barriers.
5. Type IV—Floated Surface Finish

Use a Type IV finish only on the horizontal surfaces of the following:

- Curbs and sidewalks
- Tops of caps and footings
- Surface of slope paving
- Other similar structures

Apply the Type IV finish as follows:

- a. After compacting the surface and screeding to the correct cross sections, float the surface with a wood float.
 - b. While floating the surface, bring enough mortar to the surface to achieve the desired finish, but do not reduce the wearing quality of the surface.
 - c. Make the final finish with a wood float or stiff-bristle broom.
 - d. If brooming, make the marks transverse to the traffic.
6. Type V—Sidewalk Finish
- Apply a Type V finish as follows:
- a. After placing and compacting the concrete, strike it off and give it a Type IV finish.

- b. Use an edging tool on all edges and along expansion joints unless the Plans require chamfers.
 - c. Mark off sidewalk surfaces in blocks with suitable grooving tools when required by the Plans or the Engineer.
 - d. Extend the rubbed finish on the traffic face of the curb to include the horizontal area of sidewalk between the curb corner and the longitudinal sidewalk groove.
7. Type VI—Stair Tread Finish
Achieve a Type IV finish using a stiff-bristled broom.

AC. Remove Forms

Do not remove forms and their supports, including falsework, until the Engineer approves. Use a removal method approved by the Engineer. Approval does not relieve responsibility for the safety of the Work.

1. Form Removal Time

Use a removal time shown on the Plans or specified by the Engineer.

Use Table 7 to help establish when forms can be removed safely. However, do not count days where the temperature at any time during the day is at or below 40 °F (4 °C), unless the cold weather concrete protective measures described in Subsection 500.1.03.G, “Cold Weather Concrete Curing and Protection Plan” were used.

Table 7—Estimate of Form Removal Time

Form	Time Required
Bottom of beams	10 days
Bottom of caps, trestle pile bents	4 days
Bottom of all other caps	7 days
Overhangs and slabs, including culverts	7 days
Columns and retaining walls	18 to 48 hours
Sides of beams, posts, rails, caps, footings, wingwalls, and parapets	12 to 24 hours
Bottoms of cast-in-place rails and diaphragms	48 hours
Front face of curbs	3 hours

If using high-early strength concrete, the Engineer may reduce the time limitations if the concrete develops satisfactory strengths.

2. Form Removal Method

Remove forms and falsework without injuring the concrete surface or overstressing the concrete members.

Ensure that the stress from the weight of the removal process is transferred gradually and uniformly to the concrete.

At the Contractor’s request, time of removal may be controlled by field tests on cylinders, subject to the following conditions:

- a. No tests will be performed until concrete is at least 3 days old.
- b. Required strengths will be shown on the Plans, as noted elsewhere in these Specifications, or as determined by the Engineer.
- c. The Engineer may specify a minimum time in conjunction with minimum strength requirements.
- d. Falsework and forms for culverts may be removed at such time as 75% of the concrete design strength is achieved.

AD. Apply Protective Surface Treatment

When the Plans specify a protective surface treatment, apply a boiled linseed oil mixture of 75 percent boiled linseed oil and 25 percent mineral spirits by volume to the concrete surfaces.

Use linseed oil that meets the requirements of ASTM D 260, Type I or Type II. Use a quality commercial mineral spirit that passes infrared spectroscopic analysis to the satisfaction of the laboratory.

Unless otherwise noted on the Plans or the manufacturer's recommendations, apply the mixture as a preservative seal coat to the top surfaces of bridge decks, curbs, and sidewalks and to the inside vertical faces of curbs, parapets, and end posts. Protect metal handrailing and metal handrail posts from treatment.

Apply the protective surface treatment as follows:

CAUTION: Because the linseed oil-petroleum spirits mixture has a low flash point and is readily flammable, protect the mixture from fire, especially cigarettes and sparks. Prohibit traffic from the treated area until the Engineer determines the concrete has regained its dry appearance.

1. Do not place the protective surface treatment until concrete work, including final rubbing, is completed and expansion joint sealing compound is placed.
2. Do not apply the treatment until the concrete is at least 14 days old.
3. Unless otherwise permitted by the Engineer, apply the treatment when the temperature of the concrete and air is at least 50 °F (10 °C).
4. Apply in time to allow the treatment to dry thoroughly before allowing traffic, including haul traffic, on the structure. If the structure meets the following exceptions, apply the treatment after using the structure for hauling.
 - Temperature limitations prohibit application.
The Engineer will send a written notification to the Contractor (or Bridge Contractor) if temperature requirements prohibit application.
 - The structure is absolutely required for hauling to complete a Contract.
Request a written approval from the Engineer if hauling across a structure before the treatment is placed.
5. If applying the treatment after using the structure for hauling, thoroughly clean the surfaces to be treated to allow the treatment to penetrate completely.
6. If there are separate bridge and roadway Contracts, have the roadway Contractor clean the surfaces immediately upon request by the Engineer.
7. Prepare the surface for the treatment as follows:
 - a. Clean off oil, grime, and loose particles that prevent the mixture from penetrating.
 - b. Ensure that the concrete surfaces have at least 48 hours to dry after rainfall or wet cleaning operations.
 - c. Immediately before applying the treatment, direct an air blast over the surfaces to remove dust.
 - d. Mask the exposed plates of joints.
8. Apply the mixture by hand or by spraying in one application at the rate of 1 gal (1 L) of mixture per 37.5 yd² (8.5 m²).
 - a. Thoroughly clean the inside of spraying equipment before putting the surface treatment in.
 - b. Keep spray nozzles within 18 in (600 mm) of the concrete unless otherwise directed by the Engineer, Plans, or manufacturer.

AE. Apply Graffiti-Proof Coating

When the Plans specify a graffiti-proof coating, apply the coating system to concrete surfaces or over special surface coatings. Use material that complies with Section 838.

Apply the coating as follows:

1. Clean loose particles, dirt, grease, oil, and other foreign particles off the surface.
2. Apply the coating according to the manufacturer's recommendations for:
 - Weather conditions
 - Material preparation

- Coating application
- Number of coats

AF. Expose New Concrete to Loads

Prohibit dead or live loads during or after construction except as described in this section. If using high early strength concrete, the Engineer may reduce time limitations if the concrete develops adequate strength.

1. Dead Loads on the Substructure

After pouring footings, do not begin work on columns or piers for at least 12 hours.

After pouring columns, do not begin cap construction for at least 24 hours.

Do not place beams on caps or place falsework and forming for concrete T-Beam construction before the cap concrete reaches a minimum strength of 2,500 psi (17 MPa).

2. Dead Loads on the Superstructure

If necessary, stockpile construction materials on decks within a complete unit (a simple span or continuous or cantilever unit) if the following conditions exist:

- The deck concrete of the complete unit reaches its 28-day cylinder strength.
- The deck concrete is at least 10 days old.
- The curbs are at least 5 days old.

The Engineer must approve the location, height, and spread of the loads.

On composite-design bridges (those that have prestressed concrete beams or steel beams with shear connectors), do not pour curbs, parapets, or sidewalks until the deck concrete reaches a minimum strength of 1,500 psi (10 MPa) or is at least 3 days old.

3. Dead Loads on Concrete Box Culverts

Do not backfill any section of a concrete box culvert until the last concrete placed in that section is at least 14 days old, unless early cylinder breaks indicate otherwise.

If early cylinder breaks indicate that design strength has been achieved, backfill sections of culverts when the concrete placed last is at least 7 days old.

4. Live Loads—Pouring Equipment

Do not allow power-operated concrete buggies to cross a deck until the concrete reaches a minimum strength of 1,500 psi (10 MPa) or is at least 3 days old.

Allow hand-operated buggies to cross after the concrete is 24 hours old.

5. Live Loads—Mixing and Lifting Equipment

Do not place mixers on a deck in a complete unit (a simple span or continuous or cantilever unit) until the deck concrete of the complete unit reaches its 28-day cylinder strength and is at least 10 days old.

When deck concrete reaches its 28-day cylinder strength and is at least 10 days old, allow mixer trucks on the unit during the curb concrete pour only if the pour is completed within 45 minutes of being started.

Do not allow any equipment on the unit for 5 days after curb pours.

The Engineer may allow concrete placement procedures that use heavy lifting equipment on the decks if the following conditions exist:

- The deck concrete reaches its 28-day cylinder strength.
- The deck concrete is at least 14 days old.
- The curbs on the deck are at least 10 days old.

6. Live Loads—Hauling over Bridges

Use a new bridge for hauling only if no other practical haul routes are available and only if the Engineer permits it.

- a. Govern hauling by the restrictions and requirements listed in Table 8. If any of the restrictions and requirements are violated, the Engineer will limit loads to the following:

- Single 32,000 lb (14 515 kg) axle when the bridge design loading is HS 20-44 and/or Military Loading
- Single 24,000 lb (10 886 kg) axle when the bridge design loading is HS 15-44 or H 15-44

Table 8—Weight Limits for Hauling on New Bridges

Axle Criteria	Bridge Design Loading	
	HS 20-44 and/or Military Loading	HS 15-44 or H 15-44
Maximum Axle Load Per Axle	60,000 lbs (27 216 kg)	44,000 lbs (19 958 kg)
Maximum Axle Load on Dual Axles Per Axle	45,000 lbs (20 412 kg)	33,000 lbs (14 969 kg)
Maximum Total Load	100,000 lbs (45 360 kg)	73,000 lbs (33 113 kg)

- b. Ensure that bridge concrete, including curbs, parapets, barriers and sidewalks, is at least 14 days old and has a minimum compressive strength of 3,000 psi (20 MPa).
- c. Apply the linseed oil special protective treatment, if required see (Subsection 500.3.05.AD, “Apply Protective Surface Treatment”).
- d. . After applying the protective treatment (if required), apply water-repellent silicone materials to the handrail, handrail posts, end posts, and curb faces before hauling begins.
- e. Do not allow more than one vehicle at a time on a simple or multiple-span unit.
- f. Ensure that vehicle speeds, loaded or unloaded, do not exceed 5 miles/hr (8 km/hr) when the following loads occur:
 - Bridges designed for HS 20-44 and/or Military Loading:
 - Loads on single axles exceed 32,000 lbs (14 515 kg)
 - Loads on each dual axle exceed 24,000 lbs (10 886 kg)
 - Bridges designed for HS 15-44 or H 15-44 loading:
 - Loads on single axles exceed 24,000 lbs (10 886 kg)
 - Loads on each dual axle exceed 16,000 lbs (7257 kg)

When axle loads do not exceed these loads, ensure that vehicle speeds are 15 mph (24 kph) or less.

- g. Place temporary guides on beams so wheels will track directly.
- h. Keep earth approaches smooth and level with the bridge floor or approach slab to minimize impact. Stabilize sandy and other unstable soils (at no expense to the Department) with crushed stone or other suitable material for at least 10 ft (3 m) from the end of the bridge or approach slab.
- i. Protect the ends of bridges or approach slabs with a timber strip at least 4 in (100 mm) wide, cut to rest on either the paving rest of the bridge end or the pavement subgrade at the end of the approach slab. Keep the strip in place for protection during incidental hauling. Remove it before constructing the adjacent pavement. Keep the top of each timber strip flush with the top of the concrete surface. Fit the strip tightly against the end of the bridge or approach slab. If the timber strip is displaced, stop hauling until the strip is reset or replaced.
- j. Clean spills off the bridge floor.

AG. Complete Corrective Work

After the Department gives the deck surface a Ride Quality Test described in Subsection 500.3.06.E, “Ride Quality Test,” complete corrective work at no cost to the Department and before doing the final surface texturing.

Complete corrective work as follows:

1. Plane the deck according to Section 431.
2. Limit concrete removal by planing so that the final bar cover is not less than the Plan cover minus 1/2 in (13 mm).
3. If the final bar cover limits cannot be met, perform the corrective work as directed by the Engineer.

4. Ensure that the final riding surface complies with this Specification and the requirements for a grooved finish.
5. If necessary, use a bump grinder to correct bumps with a profile base line of 5 ft (1.5 m) or less.
6. Have planed decks retested as described in Subsection 500.3.06.E, “Ride Quality Test,” to ensure that the ride quality meets the requirements of this Specification.

AH. Plane the Deck

Schedule the ride quality test at least 5 days before needed by contacting the Office of Materials. Ensure that the area to be tested is clean and clear of obstructions.

When possible, delay expansion joint installation and temporarily bridge the joint to operate Lightweight Profiler and planning equipment across the joint.

Planning responsibilities are shown in Table 9:

Table 9—Planning Responsibilities

Area Planed	Person Responsible
Bridge decks	Bridge Contractor
Approach slabs constructed under the bridge Contract	Bridge Contractor
Approach slabs constructed under the roadway Contract	Roadway Contractor

AI. Perform Retaining Wall Incidentals

Retaining wall incidentals are as follows:

1. Drainage

Unless otherwise shown on the Plans or in the Special Provisions, ensure that drainage for retaining walls is either Alternate A or Alternate B on Georgia Standards 4948 and 9031-L.

Ensure that the Number 10 concrete sand complies with Subsection 801.2.02, “Fine Aggregate for Portland cement Concrete of All Types and for Mortar” and has a permeability coefficient of at least 100 ft (30 m) per day.

The Engineer may waive the grading requirement for Number 10 concrete sand if the permeability coefficient of the material does not exceed 500 ft (150 m) per day.

Omit the drainage blanket and stone for retaining walls only when the height does not exceed 6 ft (1.8 m).

When the Plans specify different drainage details, furnish, place, or build the various items according to the Plan requirements.

2. Waterproofing and Dampproofing

When waterproofing and dampproofing are specified in the Plans, comply with the requirements of Sections 530 and 531.

AJ. Place Utility Installation Hardware

When the Plans require placing utility installation hardware, the utility company involved will furnish the items.

Place the items as directed on the Plans or Shop Drawings. All other work, including painting as required, is the utility company’s responsibility.

AK. Widen Bases and Pavement

When using narrow sections of Portland cement concrete to widen existing bases or bases and pavements, use Class B concrete as shown on the Plans or as directed by the Engineer.

AL. Open the Structure to Traffic

Open a structure to traffic other than haul traffic after all concrete in the decks, parapets, or curbs (sidewalks) reaches its 28-day cylinder strength and is at least 14 days old.

500.3.06 Quality Acceptance

A. Strength Requirement Tests

When job site test specimens fail to meet the strength requirements in the Table 1—Concrete Mix Table , determine the Final Acceptance or rejection of concrete in place by coring or non-destructive testing.

At the Contractor’s request, the Department will determine the removal time for forms by conducting field tests on cylinders.

Tests are subject to the following:

1. Tests will be performed when the concrete is at least three days old.
2. The Plans will show the required strengths.
3. At the Contractor’s request, the Engineer may specify a minimum time with minimum strength requirements.

B. Honeycombed Area Check

If there are honeycombed areas that extend beyond the reinforcement steel, the Engineer may reject the entire pour with the honeycombed area.

C. Bridge Deck Slab Concrete Inspection

The Engineer will carefully observe the construction methods used during all phases of the bridge deck slab construction. These phases include the following:

- Metal form installation
- Reinforcement location and fastening
- Concrete item composition
- Mixing procedures
- Concrete placement and vibration
- Bridge deck finishing

Provide the needed facilities for the Engineer to safely and conveniently inspect the concrete.

The concrete inspection procedure is as follows:

1. After the deck concrete has been in place for at least two days, the Engineer will sound a hammer on at least two areas of the deck for each slab pour. This test checks for concrete soundness and form bonding.
The two areas will encompass at least 10 percent of the total area of the deck pour.
2. The Engineer will sound other areas of the deck randomly.
3. If the Engineer doubts the soundness of an area, or if the Engineer decides that the concrete placement procedures used call for an inspection of the underside of the deck, remove at least one section of the forms for each span in the Contract.
4. Remove the form section after the pour is strong enough and when the Engineer desires to provide visual evidence that the concrete mix and the placement procedures are acceptable.
5. Remove another form section if the Engineer decides changes in the concrete mix or in the placement procedures warrant additional inspection.
6. Where form sections are removed, do not necessarily replace the forms, but repair the adjacent metal forms and supports neatly and securely.
7. When the form is removed, the Engineer will examine the concrete surfaces for cavities, honeycombing, and other defects.
8. If the Engineer finds irregularities but determines that the irregularities do not justify rejection of the Work, repair the concrete as the Engineer directs and give it an ordinary surface finish according to the Contract Specifications.

9. If the concrete where the form is removed is not acceptable, remove additional forms as necessary to inspect and repair the slab.
10. Modify the construction methods as required by the Engineer to create satisfactory slab concrete.
11. Remove or repair all unsatisfactory concrete as the Engineer directs.

If the construction methods used and the inspection results indicate that the slabs have sound concrete, the Engineer may moderate the amount of random sounding and form removal after a substantial amount of slab has been constructed and inspected.

D. Bridge Deck Surface Check

After the final strike-off of the concrete and as close behind the final strike-off as possible, the Engineer will check the surface with a 10 ft (3 m) straightedge.

Attach the straightedge to a broom-type handle for easy control and use.

Bridges and approach slabs must meet a 1/8 inch in 10 ft (3 mm in 3 m) straightedge check made longitudinally and transversely.

E. Ride Quality Test

After the bridge decks and approach slabs are completed, the Department will perform a Ride Quality Test using the Lightweight Profiler and a profile index value determined according to GDT 134.

The Department will conduct the test as follows:

1. Obtain Profile Index Values for bridge decks and approach slabs for:
 - State roads with four lanes or more
 - State roads with 2 lanes where the current traffic count is 2,000 vehicles per day or higher
 - Other roads designated on the Plans
 - Bridges and approach slabs must meet the straightedge check limits described in Subsection 500.3.06.D, "Bridge Deck Surface Check."
2. Obtain profiles in the wheel paths and in safety areas to within 6 ft (1.8 m) of barrier or curb lines.
3. Average the profile index values for bridge decks including the approach slabs for the left and right wheel path for each lane.

The average value must not exceed 15 in/mile (235 mm/km) for each lane.

After the test is complete, correct individual bumps or depressions that exceed 2/10 in (5 mm) from the blanking band on the profiler trace.

The deck surface must then meet a 1/8 inch in 10 ft (3 mm in 3 m) straightedge check made transversely.

Correct bridge decks and approach slabs that do not pass the Ride Quality Test as described in Subsection 500.3.05.AG, "Complete Corrective Work."

500.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

500.4 Measurement

This work is measured for payment either per cubic yard (meter), per Lump Sum, or per linear foot (meter), whichever is shown on the Plans.

- **Seal Concrete.** The quantity of seal concrete to be measured for payment is calculated using the horizontal seal dimensions specified on the Plans.
- **Grooving.** Grooving on bridge decks and approach slabs, completed acceptably according to Subsection 500.3.05.T, "Place Bridge Deck Concrete," step 9.c, will be measured and paid for by the square yard (meter). Payment is full compensation for furnishing the necessary equipment and performing the Work.

- **Class B Concrete.** Class B concrete used for base and pavement widening will be measured and paid for by the cubic yard (meter) complete in place and accepted.

500.4.01 Limits

A. Measurement for Separate Payment

There will be no separate measurement and payment for the following:

1. On permanent steel bridge deck forms for concrete deck slabs:
 - Extra reinforcing
 - Extra concrete
 - Other costs incurred because of the requirements of this Specification

All costs are included in the Lump Sum prices bid for superstructure concrete and superstructure reinforcement.

B. Payment per Cubic Yard (Meter)

Measurement limits on payment per cubic yard (meter) are:

1. Bridges, Concrete Culverts, Headwalls, and Retaining Walls

The quantity of concrete measured for payment is the algebraic summation of the Base Pay Quantity and authorized quantity changes.

If additional quantities are necessary because of any of the following, these quantities are measured separately for payment:

- Rocks were removed carefully but additional quantities are needed because footing depth and keyway dimension are irregular from unanticipated rock removal.
- Voids or crevices exist within the spread footing area.
- The Engineer authorized filling trenches cut in rock outside footing areas to ease dewatering.

These additional quantities will be paid as filler concrete per cubic yard (meter).

2. Seals

When the Plans do not require a seal but a seal becomes necessary, or when the Plans do not show seal dimensions, the maximum pay dimensions in each direction will be the Plan dimension of the structural footing plus 3 ft (1 m), with 18 in (600 mm) on each side.

If the Contractor uses lesser dimensions, measurement is based on the lesser dimensions. Concrete placed beyond the maximum pay limits are not measured.

C. Payment per Lump Sum

For Lump Sum payment, determine the quantities required before submitting the bid.

The concrete quantity must conform to the Plan dimensions. Measurement is made as a unit, complete in place, and includes the following:

- Diaphragms
- Sidewalks
- Concrete parapets

Measurement does not include concrete in the following items that will be paid for separately:

- Concrete handrailing
- Barriers
- Prestressed bridge members.

Payments for parapets placed by slip-form method is included in the Lump Sum price bid for superstructure concrete.

Unless otherwise shown on the Plans, the cost of steel joints and metal bearing assemblies used in structures where there is no structural steel Pay Item are included in the Contract Price for superstructure concrete.

D. Retaining Wall Incidentals

Retaining wall incidentals will be measured for payment as follows:

1. Drainage Systems

Drainage items required by Special Plans are measured for payment by the unit specified on the Plans only when they are set up as specific Pay Items and are paid for separately. Otherwise, their costs are included in the Contract Price for concrete.

Payment is full compensation for the costs of excavation and backfill necessary to place the drainage items required by Special Plans.

The following are not measured for separate payment. Costs are included in the Contract Price for concrete.

- Sand blankets
- Crushed or broken stone
- Weep holes

2. Miscellaneous

The following are not measured for separate payment. Costs are included in the Contract Price for concrete.

- Expansion material
- Rubber or polyvinyl plastic water stops

E. Utility Installation Hardware

The cost of placing utility hardware items is included in the Contract Price for the class of concrete the items are placed in.

500.5 Payment

This Work will be paid for at the Contract Price per cubic yard (meter), per Lump Sum, or per linear foot (meter), each complete in place and accepted.

Payment is full compensation for all things, including incidentals, and direct and indirect costs, to complete the Work.

Payment will be made under:

Item No.	Item	Payment
500	Superstructure concrete class____, Bridge no.____	Per lump sum
500	Concrete handrailing (designation)	Per linear foot (meter)
500	Class____concrete	Per cubic yard (meter)
500	Class____concrete, high-early strength	Per cubic yard (meter)
500	Seal concrete	Per cubic yard (meter)
500	Class B concrete base or pavement widening	Per cubic yard (meter)
500	Class____concrete including reinforcement steel	Per cubic yard (meter)
500	Class A concrete—filler	Per cubic yard (meter)
500	Class____concrete—retaining wall	Per cubic yard (meter)
500	Grooved concrete	Per square yard (meter)
500	Concrete barrier	Per linear foot (meter)

500.5.01 Adjustments

A. Contractor Costs

Assume the following costs:

1. Costs related to rejected concrete and removing rejected concrete
2. Costs of forming an approved construction joint, removing a partial pour, or completing other remedial measures requested by the Engineer unless the fault lies solely with the Department
3. Costs of repairing, removing, and replacing falsework as directed by the Engineer
4. Costs of repairing, removing, or replacing forms
5. Costs of air-blown mortar to repair honeycombed areas, if required by the Engineer
6. Costs of using a higher class of concrete to widen existing bases or bases and pavements

B. Ride Quality Testing

The Department will conduct ride quality testing of bridge decks and approach slabs only twice per bridge at no cost to the Contractor.

The Department will conduct additional ride quality testing at the cost of \$500 per test.

C. Plastic Shrinkage Crack Repair

The Engineer will determine how to repair cracks caused by plastic shrinking. Repair cracks at no cost to the Department.

D. Plan Quantities

For all bridges (except seal concrete), concrete culverts, headwalls, and retaining walls, the quantities shown on the Contract Plans, including Standard Plans, will be considered the Base Pay Quantity.

For seal concrete, the Plan quantities are approximate and are for estimating purposes only. The quantities will not be considered as Base Pay Quantities.

Calculated additions or deductions will be applied to the Base Pay Quantity when the Engineer makes authorized changes. Changes include, but are not limited to, authorized changes in the following:

- Footing dimensions
- Lengthening or shortening of concrete culverts
- Correcting Plan Quantities
- Dimension errors
- Multi-barrel culvert wall thicknesses
- Lengthening or shortening bridge columns
- Raising or lowering foundations

Calculations of the Base Pay Quantity and any changes will be made as follows:

1. No deductions will be made for the volume of concrete used by scorings, panels, and chamfers if the individual areas are less than 1 in² (625 mm²).
The volume of concrete in fillets of the same area will be neglected.
2. The volume of structural steel and of steel and concrete piling encased in concrete will be deducted.
3. The volume of timber piling encased in concrete will be deducted on the basis of 0.8 ft³/linear foot (0.07 m³/linear meter) of pile.
4. No deduction will be made for the volume of concrete displaced by the following:
 - Steel reinforcement
 - Shear connectors

- Floor drains (unless they are paid for as separate Pay Items)
- Incidentals such as expansion material
- Joint sealing compound
- Utility thimbles and hangers

E. Filler Concrete

Filler concrete, measured as described in Subsection 500.4.01.B.1, “Bridges, Concrete Culverts, Headwalls, and Retaining Walls,” will be paid at 40 percent of the Contract Price per cubic meter for Class A Concrete or Class AA Concrete.

F. Seal Concrete

If there is no Contract Price for seal concrete, payment will be per cubic yard (meter), measured as described in Subsection 500.4.01.B.2, “Seals,” and will be paid at 60 percent of the Contract Price per cubic yard (meter) for Class A concrete.

G. Lump Sum Payment Adjustments

Adjust the payment as follows:

1. Authorized Change Adjustments

When authorized changes are made as described in Subsection 500.5.01.D, “Plan Quantities,” the lump sum payment may be adjusted on a pro rata basis or according to Section 104 and as determined by the Engineer.

The Plans show tabulated quantities as a service. This does not relieve any responsibility to conform to Plan details.

2. Optional Plan Feature Adjustments

If exercising an optional Plan feature, the Base Pay Quantity will not be changed if it is the only quantity change involved.

However, if other changes are necessary, the quantity change resulting from the optional feature will be considered in the necessary quantity adjustments.

3. Falsework for Post-Tensioned Box Girder Bridge Adjustments

When the falsework is completed for post-tensioned box girder bridges, 20 percent of the Lump Sum superstructure concrete price will be paid.

Additional payments made as the concrete is placed must be adjusted for the payment for falsework. In other words, payment for concrete placed will be based on 80 percent of the superstructure bid price.

4. When Metal Deck Forms are used and have been placed, payment in the amount of 5% of the Lump Sum Superstructure Concrete price will be made. For Post-Tensioned Box Girder Bridges, this percentage (5%) will apply to that part of the superstructure concrete in the top slab of the box only.

Section 501—Steel Structures

501.1 General Description

This work includes furnishing and building with structural steel and miscellaneous metals to the lines, grades, and dimensions shown on the Plans or established by the Engineer.

The work does not include bearing devices for prestressed concrete bridge members, utility installation hardware, or any metal covered under another Pay Item.

501.1.01 Definitions

HTS Bolts: High Tensile-Strength bolts.

501.1.03 Submittals

A. Pre-Inspection Documentation

Furnish documentation required by the latest ANSI/AASHTO/AWS D 1.5 under radiographic, ultrasonic, and magnetic particle testing and reporting to the State's inspector before the quality assurance inspection.

B. Shop Drawings

Prepare Shop Drawings for structural steel and other metal materials to be fabricated. Show the details necessary for shop fabrication and field erection.

1. **Description.** Use the standard sheet size of the Department's Bridge Office. Submit at least two complete sets of preliminary prints marked "NOT FOR FIELD USE" to the Department's Bridge and Structural Design Engineer (the Bridge Engineer) for review before fabricating materials.

As an option, shop drawings may be submitted on plan sheet sizes of 12" x 18" (305 mm x 457 mm) or 11" x 17" (279 mm x 432 mm) for review and approval. Information contained on these sheets must be legible.

After shop drawings have been approved, submit an electronic file that is compatible with Bentley Microstation J (Version 7) Cadd operating system, or an electronic file in Adobe Acrobat Portable Document Format (.pdf) to the Engineer. For bridges carrying railroads only, after shop drawings have been approved, submit one full size set of reproducible drawings to the Department.

2. **Review Process.** After the preliminary prints have been reviewed and revisions have been made, submit 5 or more complete sets of the final drawings to the Bridge Engineer. The Bridge Engineer will mark each drawing with a conditional approval stamp and return one stamped set to the fabricator. Furnish the Bridge Engineer with as many additional sets of final prints as required.

The Bridge Engineer's review and conditional approval of Shop Drawings is a service for the Contractor. The Department assumes no responsibility for the accuracy of the drawings, and the Contractor will not be relieved of any responsibility for conforming to the Specifications and Plans.

3. **Railway Structures.** For structures carrying railway traffic and for other structures when specifically designated, furnish the Bridge Engineer a full set of permanent reproducibles of the final Shop Drawings.
4. **Welded Construction.** On Shop Drawings for welded construction, use the standard welding symbols of the American Welding Society. Explain special conditions in notes or details. Show the sequence and techniques for areas where shrinkage stress and distortion control is necessary.
5. **Changes and Substitutions.** Do not change a Shop Drawing after it has been conditionally approved unless the Bridge Engineer gives written consent. List and symbolize revisions on each drawing.
Obtain written consent from the Bridge Engineer before substituting materials with dimensions and weights other than those shown on the Plans. Make changes associated with an approved substitution at no expense to the Department.
6. **Alternate Locations of Splices and Connections.** If splices or connections are desired at locations other than those shown on the Plans, submit a proposal and Shop Drawings to the Bridge Engineer to get written approval before proceeding.
7. **Steel Identification.** Upon request, furnish an affidavit certifying the identification of steel is maintained throughout fabrication.

On the Shop Drawings, show the grade of steel to be used and identify each piece. Give pieces made of different types or grades of steel different assembly or erection marks.

Maintain the identity of the mill test report number when assembly-marking individual pieces and when giving cutting instructions to the shop.

C. Fabrication Schedule

Ensure that the fabricator submits a proposed fabrication schedule to the State Materials Engineer that includes the following:

- Correct project number, including county
- Bridge number
- Starting date
- Estimated completion date

D. Quality Control Program

Before fabrication begins, submit the fabricator's written Quality Control program to the Office of Materials for approval. This program and its personnel will be subject to verification when the Department's Materials Engineer deems necessary.

Even with a State inspection, continue to perform Quality Control (QC) on all nonfracture-critical and fracture-critical members and components.

E. Mill Orders and Shipping Statements

Furnish the number of copies of mill orders and shipping statements covering fabricated materials and related miscellaneous materials the Engineer directs. Show the weights of individual members on the statements.

F. Mill Test Reports

Furnish the Engineer two certified, legible copies of mill test reports that show the results of physical tests and complete ladle analyses for each heat and grade of steel ordered. Refer to the ASTM designation of tests used. Furnish mill test reports at no expense to the Department.

G. Welding Procedures

Before structural steel fabrication begins, submit welding procedures to the Engineer for review and approval.

H. Electrode Testing

Furnish a manufacturer’s certification showing that the material requirements used for manufacturing the tested electrodes and furnished electrodes were the same for each lot of electrodes on the Project.

I. Falsework

If required, prepare and submit falsework plans for the Engineer’s review. Continue to assume the responsibility to produce safe falsework. When erection is completed, remove falsework to the Engineer’s satisfaction.

J. Camber Diagram

Furnish the Engineer a diagram showing the camber at each splice point for each girder. Base the diagram on measurements taken during shop assembly. In the case of partial shop assembly, base the camber diagram on theoretical calculated values.

501.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Structural Steel	851.2.01
Cold-Finish Carbon Shafting	854.2.06
Steel Castings	854.2.07
Paints	870
Steel Bolts, Nuts, and Washers	852.2.01
Anchor Bolts	852.2.02
High Tensile-Strength Bolts, Nuts, and Washers	852.2.03
Shear Connectors	512
Elastomeric Pads	885.2.01
Plain Cotton Duck	881.2.01
Rubber-Impregnated Cotton Duck	881.2.02
Self-Lubricating Bronze Bearing and Expansion Plates Galvanizing and Bushings	857.2.03 ASTM A 153/A 153M

1. **Fasteners.** Use fasteners in their lubricated, as-delivered condition. Use black bolts oily to the touch. With galvanized assemblies, use nuts with a clean, dry lubricant that contrasts with the color of the zinc coating.

2. **Self-Lubricating Bronze Plates.** Use cast-bronze plates of the type shown on the Shop Drawings, unless otherwise shown on the Plans.

501.2.01 Delivery, Storage, and Handling

A. Fasteners

Store fasteners to protect them from dirt and moisture. Take from storage only enough fasteners to install and tighten during a work shift. Return unused fasteners to protective storage at the end of the shift.

B. Structural Steel Members

1. Delivery

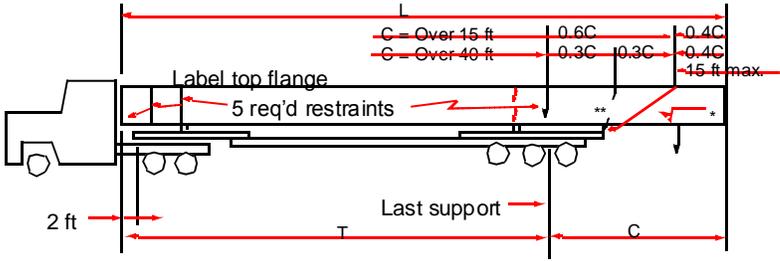

Load, transport, and unload girders without excessive stress or damage.

The Engineer will observe the delivery of beams or girders and will immediately notify the Contractor of damaged or unsatisfactory material before the material is unloaded or as soon as the damage is discovered.

If members are improperly handled, the Inspector may withhold or remove the final stamp of approval.

Use Figure 1, Figure 2, and the following loading specifications and shipping details for truck, rail, or barge transportation.

- a. Use chains and chain binders to secure beams and girders during shipping only if using a protective shield to prevent gouging flanges and if providing adequate bracing to prevent bending the top flanges.
- b. Keep the center of gravity of beams, girders, and heavy haunch sections as low as possible.
- c. Use access roads to safely deliver beams and girders to the site.

$C = 0.2L$ min.
 $C = 0.3L$ max.

For short beams or girders supported on a flat bed the min. C may be disregarded.

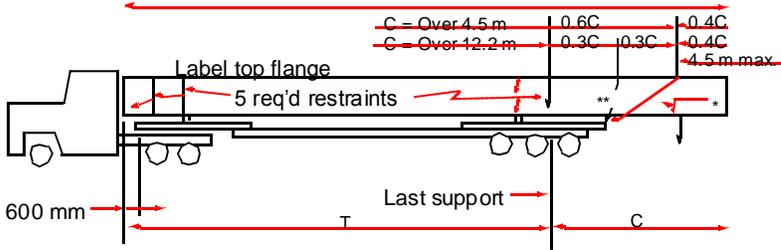

* If $C =$ over 15 ft use additional restraint here.

** If $C =$ over 40 ft use another restraint here.

$0.4C$ may be increased to 15 ft to cut down or restraint length, or where angle is too flat.

Beam of overhang ends shall be restrained against flapping horizontally and vertically.

Figure 1

$C = 0.2L$ min.
 $C = 0.3L$ max.

For short beams or girders supported on a flat bed the min. C may be disregarded.

* If $C =$ over 4.5 m use additional restraint here.

** If $C =$ over 12.2 m use another restraint here.

$0.4C$ may be increased to 4.5 m to cut-down or restraint length, or where angle is too flat.

Beam of overhang ends shall be restrained against flapping horizontally and vertically.

Figure 1 (metric)

Table of Dimensions—Feet					
1	Min. C & T		Remarks	Max. C & T	
75	15	60		22.5	16.0
80	16	64		24	17.0

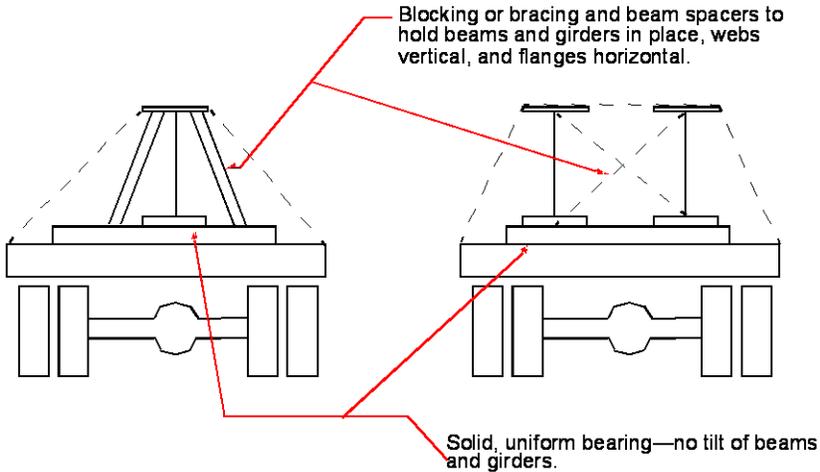

Figure 2 (metric)

2. Storage

Handle structural steel during storage in the same manner as during fabrication. See Subsection 501.2.01.B.2.a, “General” and Subsection 501.2.01.B.3, “Handling.”

a. General

Place beams and girders with their webs vertical. Shore, brace, or clamp beams and girders to resist lateral forces during storage. Keep steel free from dirt, oil, grease, or other contaminants and protect it from corrosion. Pitch trough sections to provide water drainage.

Do not stack beams and girders on each other.

Place long members on supports close together to prevent damage from deflection.

The Engineer will observe the storage and handling of beams or girders and ensure that they are satisfactory before erection.

b. Supports

The material on which the beams and girder supports are placed shall be firm, well-drained, unyielding, and not allow excessive or uneven settlement when the supports are loaded.

Store beams and girders on platforms, skids, or other supports on the ground above high-water elevation.

Shore supports with firm, well-drained unyielding material. Use material that settles evenly when the supports are loaded.

Support beams and girders adjacent to the bearings and at intervals of no more than 25 ft (7.5 m). Use enough intermediate supports to prevent damage from deflection.

3. Handling

Handle steel members with clamps, plate hooks, or devices to avoid nicks, gouges, or depressions. Do not use chains and chokers to handle steel members unless using a protective shield between the chain or choker and the member.

a. Beam and Girder Pick Up

Use spreader bars to lift beams and girders over 50 ft (15 m) in length.

- One-point pick ups are allowed for beams and girders less than 50 ft (15 m) long.
- Use two-point pick ups so the amount of overhang and distance between hooks does not exceed the distances in the following table:

Beam Size	30 in (760 mm) WF	33 in (840 mm) WF	36 in (920 mm) WF	Plate Girders
2-point pick-up distance between hooks linear feet (meters) maximum	74 (22)	80 (24)	85 (26)	100(30)
2-point pick-up overhang linear feet (meters) maximum	25 (7)	28 (8)	30 (9)	35 (10)
WF = Wide Flange				

If using pick-ups that cause long overhangs, attach lines at beam ends to control movement.

b. Beam and Girder Protection

Keep webs of beams and girders vertical while handling. Never drop, throw, or drag beams and girders.

Do not allow beams or girders to bend about the weak axis, even under their own weight. When shipping beams or girders upside-down, use caution when turning them over for shipment and turning them right-side up at their destination. Use enough blocking and pick-up points to prevent excess stress on the girder.

501.3 Construction Requirements

501.3.01 Personnel

A. Fabricators

Employ structural steel fabricators certified under the AISC Certification Program, Category III—Major Steel Bridges.

B. Welders

Qualify field welders according to ANSI/AASHTO/AWS D 1.5. Employ certified welders who possess a current welding certification card issued by the Department's Office of Materials.

501.3.02 Equipment

A. Tension Measuring Device

Have a tension measuring device at all job sites where High Tensile-Strength bolts are installed and tightened. Use the tension-measuring device to:

- Confirm the proper snug tight and final installation bolt tension
- Calibrate wrenches properly
- Ensure the bolting crew understands the importance of proper bolt tensioning

At least once a year, have an approved testing agency calibrate the tension-measuring device to confirm its accuracy.

B. Wrenches

If using the calibrated wrench method to tighten HTS bolts, calibrate the wrench at least once each working day for each diameter, length, and grade of bolt to be installed. Recalibrate the wrench when adding or deleting the air hose, changing compressors, or performing similar tasks.

Use the wrench in job-site tightening under the exact conditions that it was calibrated. Recalibrate wrenches if a significant difference is noted in the surface condition or level of lubrication of the bolt threads, nuts, or washers.

C. Ovens

Use electric drying ovens approved by the Engineer to dry electrodes according to ANSI/AASHTO/ AWS D 1.5.

D. Lifting Equipment

Use proper lifting equipment that can carefully handle steel members without bending, twisting, damaging, or excessively stressing parts. Use cranes that have at least a two-part line for lifting.

The Department will terminate shop inspection if lifting equipment is operated or maintained in a hazardous manner.

E. Erection Equipment

Proposed erection equipment is subject to the Engineer's review. Even with this review, assume responsibility for providing adequate and safe equipment and for carrying out the work according to the Plans and Specifications. Begin erection only after the Engineer's review.

501.3.03 Preparation

A. Installation Method Testing for Bolted Construction

Before beginning the bolting operation, the Engineer will verify the Contractor's installation method. Verification will determine if the method used (calibrated wrench or turn-of-nut) will produce the correct bolt tension in the HTS structural bolts of the completed connection.

If the method is successful, the total clamping force of bolts will be transferred to the connected members and will resist slipping through friction.

Do not use bolts tightened during installation method tests or use other previously used HTS structural bolts in the work.

1. Verification Procedures for Both Methods

Test both methods of tightening (calibrated wrench or turn-of-nut) with the following procedures:

- a. Select three assemblies (bolt, nut, and washer) from each diameter, length, and grade to be installed.
- b. Install each bolt, nut, and washer into the tension-measuring device.
- c. Install enough spacers or washers so that at least 3 but not more than 5 full threads are between the nut face and the underside of the bolt head.
- d. Use the same type of element (nut or bolt head) as will be used in the work. Place a hardened washer under the turned element.
- e. Snug tighten each assembly using the procedure that will be used in the work.
- f. After snug tightening, place appropriate marks on the end of the bolt stick out and nut, bolt head and tension calibrator, or drive socket and tension calibrator.

2. Calibrated Wrench Method Verification

a. Impact Wrench

When using an impact wrench:

- 1) Tighten each of the three assemblies beyond snug tight.
- 2) Adjust the wrench to cut out at a tension no less than 5 to 10 percent higher than the appropriate tension shown in Table A: Required Fastener Tension.

Bolts tightened to this cut-out point should consistently develop the required minimum tension. This cut-out point shall be the actual job-site setting.

b. Manual Torque Wrench

When using a manual torque wrench:

- 1) Tighten each of the three assemblies beyond snug tight.
- 2) Note the torque required to induce a bolt tension 5 to 10 percent higher than the appropriate tension shown in Table A: Required Fastener Tension.
- 3) Measure torque with the nut in rotation.
- 4) Average the three tests to find the minimum torque to use for job-site installation tightening.
- 5) If the torque wrench produces erratic results, do not use that wrench.

3. Turn-of-Nut Method Verification

When using the turn-of-nut method, tighten the three assemblies beyond snug tight to the appropriate rotation shown in Table B: Nut Rotation from Snug Tight. Ensure that at this rotation, the minimum bolt tension is 5 to 10 percent higher than the appropriate tension shown in Table A: Required Fastener Tension.

Table A: Required Fastener Tension		
Nominal Bolt Diameter and Thread Pitch	Minimum Tension (1) in kips (kN)	
	ASTM A325 (A 325M)Bolts	ASTM A490 (A 490M) Bolts
1/2	12	15
5/8 (M 16 x 2)	19 (91)	24 (114)

Table A: Required Fastener Tension		
Nominal Bolt Diameter and Thread Pitch	Minimum Tension (1) in kips (kN)	
	ASTM A325 (A 325M)Bolts	ASTM A490 (A 490M) Bolts
3/4 (M20 x 2.5)	28 (142)	35 (179)
7/8 (M22 x 2.5)	39 (176)	49 (221)
1 (M24 x 3)	51(205)	64 (257)
1-1/8 (M27 x 3)	56 (267)	80 (334)
1-1/4 (M30 x 3.5)	71(326)	102(408)
1-3/8	85	121
1-1/2 (M36 x 4)	103 (475)	148 (495)

(1) Equal to 70 percent of specified minimum tensile strengths of bolts (as specified in ASTM Specifications for tests of full-size A 325 (A 325M) and A 490 (A 490M) bolts with UNC (metric) threads loaded in axial tension) rounded to the nearest kip (kN).

Table B: Nut Rotation(1) from Snug Tight			
Bolt Length (measured from underside of head to end of bolt)	Both faces normal to bolt axis	One face normal, one faced sloped not more than 1:20	Both faces sloped not more than 1:20
4 x bolt diameter or less	1/3 turn	1/2 turn	2/3 turn
Greater than 4 but no more than 8 x bolt diameter	1/2 turn	2/3 turn	5/6 turn
Greater than 8 but no more than 12 x bolt diameter	2/3 turn	5/6 turn	1 turn

(1) Nut rotation is relative to bolt, regardless of the element (nut or bolt) being turned. For bolts installed by 1/2 turn or less, the tolerance of plus 30 degrees, minus 0 degrees applies. For bolts installed by 2/3 turn and more, a tolerance of plus 45 degrees, minus 30 degrees applies.

501.3.04 Fabrication

A. Straightening Material

Ensure that rolled material is straight to the mill tolerances provided in ASTM A 6/A 6M before it is laid off or worked. Use straightening methods that do not injure the metal. Sharp kinks and bends will be cause for rejection the material.

B. Using Stock Material

The fabricator may use stock materials for minor Items whose quantity for the Project is less than the minimum required for mill rolling if the following requirements are met:

1. Mill test reports show that the stock material meets the requirements of the Specifications.
2. The stock material is identifiable by heat number and mill test report so the Inspector can determine if the material meets the required Specification.

Instead of these requirements, the Engineer may take representative stock samples and test them at the Contractor's expense.

C. Identifying Steel

Provide a system of assembly-marking individual pieces and the issuance of cutting instructions to the shop that will maintain identity of the mill test report number.

Before cutting or placing individual pieces of steel in stock for later use, mark the pieces with the following:

- Mill test report number
- Heat number
- Color code, if any

Transfer heat numbers and color codes only in the presence of the Inspector.

Color code steel pieces according to ASTM A 6/A 6M Specification identification. Establish and record an individual color code for steels not included in the A 6/A 6M Specification.

If steel is subject to fabrication that might erase a painted color code mark before assembly, stamp it with a steel die or attach a tag.

D. General Procedures

1. **Marking Steel.** Mark finished beams or girders with the following:

- Erection mark or match mark according to the erection diagram on the shop drawings.
- Weight, if a member weighs more than 3 tons (3 Mg).

2. **Edge Planing.** Plane sheared edges of plates more than 5/8 in (16 mm) thick to a depth of 1/4 in (6 mm).

3. **Re-Entrant Cuts.** Fillet re-entrant cuts, notch free, to a radius of at least 3/4 in (19 mm).

4. **Oxygen Cutting.** Steel may be oxygen-cut if the following is obtained:

- Smooth surface free of notches and cracks
- Accurate profile using a mechanical guide

Ensure that oxygen cutting conforms with AWS D 1.5. Oxygen-cut by hand only where approved.

After cutting, round the corners of oxygen-cut surfaces to a 1/16 in (2 mm) radius by grinding.

5. **Cambering.** The camber shown on the Plans is that required after completely fabricating the member, including attaching cover plates and shear connectors. Do not use cambering methods that will induce stresses that may impair the service life of the member.

- Obtain camber for plate girders by cutting both edges of the web after the shop web splices are complete and have been inspected.
- Apply heat no hotter than 1,150 °F (620 °C) to adjust deviations from the camber ordinates (shown on the Shop Drawings) caused by web distortion from either of the following:
 - Oxygen cutting
 - Weld metal shrinkage
- Obtain camber for rolled beams with approved heat-cambering methods.

6. **Finishing Bearing Surfaces**

Ensure that the surface finish of bearings, base plates, and other bearing surfaces in contact with each other or with concrete meets the ANSI surface roughness requirements, defined in ANSI B 46.1 Part 1, as follows:

Surface	Finish Requirement
Steel slabs	ANSI 2,000 (50 µm)
Heavy plates in contact in shoes to be welded	ANSI 1,000 (25 µm)
Milled ends of compression members and milled or ground ends of stiffeners and fillers	ANSI 500 (12.5 µm)
Bridge rollers and rockers	ANSI 250 (6.3 µm)
Pins and pin holes	ANSI 125 (3.2 µm)
Sliding bearings	ANSI 125 (125 µm)

Finish surfaces that contact metal or masonry as specified below.

- a. **Sole and Bearing Plates.** Ensure that sole and bearing plates have full contact when assembled. Straighten warped or deformed plates before machining; then do one of the following to the surfaces of plates contacting masonry:
 - 1) Machine the surfaces to an ANSI 2,000 (50 µm) surface roughness rating value.
 - 2) Straighten the surfaces so that the maximum clearance under a straightedge placed across the bearing surface in any direction is 1/16 in. (2 mm)
- b. **Cast Pedestals and Shoes.** Machine the surfaces of cast pedestals and shoes that contact metal surfaces.
- c. **Bearing Assemblies.** Finish fabricated bearing assemblies according to Subsection 501.3.04.D.6, “Finish Bearing Surfaces.”
 Perform final machining after the assembly is completely fabricated. If the completed assembly must be heat-treated, perform final machining after the heat treatment.
- d. **Plates in Contact with Elastomeric Pads.** Ensure that the plates are straight and free of loose mill scale. Do not machine-finish the surface in contact with the elastomeric pad.
- e. **Direction of Cut.** Machine the faces of movable surfaces and their opposing contact surfaces so that the finish cut is in the direction of the expected movement, unless using non directional finishing equipment.
- f. **Abutting Joints.** In compression members (and tension members when specified on the Plans), face the abutting joints and bring them to even bearings. When facing joints is not required, ensure an opening of 1/4 in (6 mm) or less.

7. Annealing and Stress Relieving

After heat treatment, machine-finish, bore, and straighten the structural members required by the Plans to be annealed or normalized. Perform full annealing and normalizing according to ASTM A 919 and the following:

- a. During heating and cooling, keep the furnace temperature uniform so the temperature difference between any two points on a member does not exceed 100 °F (40 °C).
- b. Record each furnace charge to identify the pieces in the charge and show the temperatures and schedule used. The method of recording the treatment operation procedures is subject to the Inspector’s approval.
- c. Provide proper instruments, including recording pyrometers, to determine member temperatures in the furnace.
- d. When the Contract requires, stress-relieve welded bridge shoes, pedestals, and other similar weldments according to AWS Specifications.

8. Component Fabrication

- a. **Beam and Girder Ends**

Fabricate the ends of beams and girders to be vertical in the final erected position, unless otherwise shown on the Plans.

b. End Connection Angles

Build end connection angles to the exact length shown on the Plans, measured between the heels of the connection angles. The allowed tolerance is plus 0 to minus 1/16 in (plus 0 to minus 2 mm).

Where continuity is required, face end connections. Ensure that the connection angle thickness after facing is no less than 3/8 in (10 mm) or the amount shown on the Plans.

c. Steel Joints

At the shop, shape the plates, angles, or other structural shapes to conform to the section of the concrete deck. Ensure that painting and other fabrication requirements conform to the Specifications for these Items.

d. Bent Plates

Ensure that unwelded, cold-bent, load-carrying, rolled steel plates meet the following requirements:

- 1) The bend lines are at right angles to the rolling direction.
- 2) The plate will not crack during bending.

Minimum bend radii, measured to the concave face of the metal, for all grades of steel used in this specification, are shown in the following table:

Thickness "T" in Inches (Millimeters)	Minimum Bend Radii
Up to 1/2 (12)	2 T
Over 1/2 to 1 (12 to 25)	2-1/2 T
Over 1 to 1-1/2 (25 to 38)	3 T
Over 1-1/2 to 2-1/2 (38 to 60)	3-1/2 T
Over 2-1/2 to 4 (60 to 100)	4 T

- Low-alloy steel in thicknesses over 1/2 in (12 mm) may require hot bending for small radii. If a shorter radius is essential, bend plates hot at 1,200 °F (650 °C) or less. Ensure that hot-bent plates have bend lines at right angles to the rolling direction.

- 3) Round the corners of plates to a radius of 1/16 in (2 mm) before bending.

e. Stiffeners

Ensure that bearing stiffeners and stiffeners used as supports for concentrated loads have full bearing on the flanges they transmit load to or the flanges they receive load from. Mill or grind the bearing surfaces of stiffeners.

On weldable steel in flange compression areas, the Contractor may weld stiffeners as shown on the Plans.

Ensure that stiffeners not located at points of concentrated loads fit tightly enough to keep water out after painting, unless otherwise shown.

f. Pins

Turn pins accurately to the dimensions shown on the Shop Drawings. Ensure that pins are straight, smooth, and flawless. The pins may be forged and annealed or of cold-finished, carbon steel shafting.

Furnish two pilot nuts and two driving nuts for each size of pin, unless otherwise specified.

g. Pin Holes

Bore pin holes in members so they are:

- True to the specified diameter
- Smooth
- Straight
- At right angles to the axis of the members
- Parallel with each other, unless otherwise required

Produce the final surface with a finishing cut. Bore holes in built-up members after completing bolting or welding.

Ensure that pin hole diameters meet the following requirements:

Pin Diameter	Pin Hole Diameter
5 in (125 mm) or less	Must not exceed pin diameter by more than 1/50 in (0.50 mm)
Larger than 5 in (125 mm)	Must not exceed pin diameter by more than 1/32 in (0.75 mm)

h. Threads

For structural steel construction, use threads for bolts and pins that conform to the Unified Screw Threads ANSI B1.13 (Metric Screw Threads, ANSI B 1.13M), Class 2A for external threads, and Class 2B for internal threads except pin ends with a diameter of 1 3/8 in (35 mm).

i. Unfinished and Turned Bolts

1) Bolts

Do not use ribbed bolts. Use unfinished bolts or turned bolts that conform to ASTM F 568M Class 4.6. Use bolts with single self-locking nuts or double nuts unless otherwise shown.

Use turned bolts with an ANSI surface roughness rating of 125 (3.2 μm).

2) Washers

Use beveled washers when bearing faces have a slope of more than 1 to 20 with respect to a plane normal to the bolt axis.

3) Heads and Nuts

Use hexagonal heads and nuts with standard dimensions for bolts of nominal size specified or of the next larger size. Provide a washer under the nut.

Use threads with a diameter equal to the body or nominal diameter of the bolt specified. For turned bolts, threads shall be entirely outside of the holes.

j. Anchor Bolts

Use anchor bolts of the size and shape specified on the Plans.

9. Coating Machine-Finished Steel Surfaces

Coat the following with rust-inhibiting grease or with other approved corrosion-preventive compounds:

- Opposing surfaces of sliding bearings
- Mating convex and concave surfaces of curved plates and rocker bearing assemblies
- Sliding surfaces opposite self-lubricating bronze surfaces
- Pins and pinholes

Coat other machined surfaces with one coat of the shop primer specified on the Plans. Include convex faces of rockers and sole plates at fixed bearings of spans that have line bearings on steel plates.

10. Shop Painting

Perform shop painting according to Section 535, especially Subsection 535.3.05.C, "Paint New Steel Structures," step 5.

E. Bolt Holes

Produce bolt holes as follows:

1. Full-Size Punched Holes

The Contractor may use full-size punched holes if these conditions exist:

- A member is composed of 5 or less separate thicknesses of metal, and

- The metal thickness of any one part is 3/4 in (19 mm) or less for structural steel, or 5/8 in (16 mm) or less for high-strength steel.

Poor hole matching will be cause for rejection. Punch holes as follows:

- a. Punch holes 1/16 in (2 mm) larger than the nominal diameter of the bolts.
- b. Do not punch full-sized holes on field connections of main members.
- c. Ensure that the die diameter for punched or subpunched holes does not exceed the punch diameter by more than 1/16 in (2 mm).
- d. Cut holes clean to avoid torn, ragged edges.
- e. Enlarge holes by reaming.

2. Subpunched and Subdrilled Holes

Subdrill holes 3/16 in (5 mm) smaller than the nominal diameter of the bolts.

After assembly, ream the holes if any one of the conditions exists:

- A member is composed of more than 5 separate thicknesses of metal.
- The metal thickness of any one main part is greater than 3/4 in (20 mm) for structural steel or 5/8 in (16 mm) for high-strength steel.
- When required according to Subsection 501.3.05.E.1, “Normal Assembly,” step b.

Instead of subpunching and subdrilling, the Contractor may drill holes from the solid after assembly. However, whether drilling from the solid or subdrilling and subpunching, ensure the following:

- a. Holes are no more than 1/16 in (2 mm) larger than the nominal diameter of the bolts.
- b. Holes for turned bolts are subpunched or subdrilled.
- c. Holes are carefully reamed after assembly to provide a light-driving fit with the bolt.

3. Accuracy of Punched, Subpunched, and Subdrilled Holes

Accurately full-size punch, subpunch, or subdrill holes so that after assembly but before reaming, holes meet the following requirements:

- A cylindrical pin 1/8 in (3 mm) smaller than the nominal diameter of the punched hole can enter perpendicular to the face of the member in at least 75 percent of the adjacent holes in the same plane without drifting.
- A pin 3/16 in (5 mm) smaller than the nominal diameter of the hole can pass through the hole.

If either of these requirements is not met, the faulty pieces will be rejected.

4. Reamed and Drilled Holes

Ensure that reamed and full-sized drilled holes are cylindrical, perpendicular to the member, and 1/16 in (2 mm) larger than the nominal diameter of the bolts. Ream and drill holes as follows:

- a. Direct reamers using mechanical means when practical.
- b. Ream and drill with twist drills.
- c. Remove burrs on outside surfaces. Disassemble parts, if required, to remove burrs caused by drilling or reaming.
- d. For connecting parts that require reamed or drilled holes, do the following:
 - 1) Assemble the connecting parts.
 - 2) Hold them securely while reaming or drilling.
 - 3) Match-mark them before disassembling.

5. Accuracy of Reamed and Drilled Holes

After drilling and reaming holes, ensure that at least 85 percent of the holes in any group have no offset greater than 1/32 in (0.75 mm) between adjacent thicknesses of metal. Make sure the remaining holes are not elongated or show an offset greater than 1/16 in (2 mm) between the adjacent thicknesses of metal.

6. Fitting Up

Before reaming, drilling, or bolting, ensure that the pieces forming built-up members are:

- Straight
- Close-fitting
- Clean
- True to the required dimensions
- Free from twists, bends, open joints, burrs, and other defects resulting from faulty fabrication or workmanship
- Well-pinned
- Firmly drawn together

Before shop bolting material with full-size punched holes:

- a. Ensure that holes are no more than 1/16 in (2 mm) larger than the nominal diameter of the bolt.
Holes may be spear-reamed if necessary to clear and clean them for entering bolts.
- b. Carefully adjust end connection angles and similar parts to the correct position and firmly hold them in place until bolted.
- c. Fit up connections securely before placing bolts.
- d. Ream or drill unfair holes (holes that prevent the bolt from entering).

F. High Tensile-Strength Bolt Connections

This section covers the shop and field connections of structural joints using High Tensile-Strength bolts tightened to a specified tension. Use HTS structural bolts that meet the requirements of Subsection 852.2.03, “High Tensile-Strength Bolts.” Furnish the bolts, nuts, and washers according to Subsection 852.2.03.

To seat parts solidly, keep joint surfaces (including those adjacent to the bolt heads, nut, or washers) free of scale (except tight mill scale), dirt, burrs, metal spatters, and other defects. Ensure that joint contact surfaces are free of oil, grease, paint, lacquer, galvanizing, rust, and other matter. Refer to the requirements of Subsection 535.3.05.C, “Paint New Steel Structures” step 5.

Install fasteners with a hardened washer under the nut or bolt head, whichever is the element turned in tightening.

- When the slope of the bolted-part surfaces contacting the bolt head and nut do not exceed 1:20 (with respect to a plane normal to the bolt axis), use a flat washer.
- When the slope of an outer face of the bolted parts exceeds 1:20, use a smooth, beveled washer.
- If necessary, clip washers on one side to a point no closer than 85 percent of the bolt diameter from the center of the washer.

When a joint assembly is complete, ensure that each bolt has a tension 5 to 10 percent above the required minimum value shown in Table A: Required Fastener Tension.

G. High Tensile-Strength Bolt Tightening Methods

Tighten HTS bolts with either the Calibrated Wrench Method or the Turn-of-Nut Method. For both methods, conduct the final rotation of the nut or bolt (whichever is the turned element) from a snug-tight condition according to Table B: Nut Rotation from Snug Tight.

Snug tight is the tightness achieved when the plies of the joint are in firm contact. Obtain this with a few impacts of an impact wrench or with full effort using an ordinary spud wrench. Ensure that the snug tightening procedure produces 10 to 30 percent of the required fastener tension shown in Table A: Required Fastener Tension.

1. Calibrated Wrench Method

Install bolts in the connection holes with a hardened washer under the turned element and bring the bolts up to snug tight (described above) as follows:

- a. Snug tighten systematically from the most rigid part of the connection to the free edges as follows:
 - 1) Start the tightening pattern at the center of the pattern near the end of each member being spliced.
 - 2) Work toward the edges of the splice plate.
 - b. After the initial snug tightening, systematically tighten the bolts again as necessary using a similar tightening pattern until all bolts are simultaneously snug tight and the connection is fully compacted.
 - c. Following snug tightening, tighten the bolts in the connection using a calibrated wrench (either air impact or manual torque). Systematically tighten from the most rigid part of the joint to its free edges.
 - d. After the first pass, systematically tighten the bolts again to ensure that bolts that may have relaxed from tightening adjacent bolts are tightened to the prescribed amount.
 - e. Operate impact wrenches until the wrench cuts out at the setting established by calibration.
If using a manual torque wrench, measure the target torque with the turned element in motion.
 - f. During installation in the assembled steel work, verify that the wrench adjustment selected by the calibration does not rotate the nut or bolt head from snug tight more or less than that permitted in Table B: Nut Rotation from Snug Tight.
2. Turn-of-Nut Method
- When bolts are too short to fit in the tension calibrating device, use the Turn-of-Nut Method in the actual work. Install bolt connection holes with a hardened washer under the turned element and bring the bolts up to snug tight (described above) as follows:
- a. Snug tighten the bolts using steps a and b of the Calibrated Wrench Method.
 - b. Following snug tightening, tighten the bolts in the connection by the applicable amount of rotation specified in Table B: Nut Rotation from Snug Tight.
 - c. During the tightening operation, do not rotate the part not turned by the wrench.
 - d. Tighten systematically from the most rigid part of the joint to its free edges as follows
 - 1) Start the tightening pattern at the center of the pattern near the end of each member being spliced.
 - 2) Work toward the edges of the splice plate.

H. Welded Construction

Ensure that welded construction conforms to the requirements below. Electroslag or electragas welding is prohibited.

1. **Insufficient Welds.** Repair, remove, or replace welds that do not meet the requirements of the Specifications using methods permitted by 3.7 of ANSI/AASHTO/AWS D 1.5 Specifications. If the weld is unacceptable, the Engineer will reject the entire piece.
After welding repairs are made, the Engineer will have the repaired areas retested to determine if the repairs meet Specification requirements.
2. **Unauthorized Welds.** Obtain the Engineer's approval before making temporary or permanent welds not shown on the Plans or permitted by the Specifications.

I. Alterations to AASHTO Paragraphs

Ensure that welded construction conforms to the American Welding Society (AWS) "Bridge Welding Code" ANSI/AASHTO/AWS D 1.5 (including revisions) except as modified by these Specifications and AASHTO. Exceptions to the ANSI/AASHTO/AWS specifications are noted below.

1. **Paragraph 3.5.2.** Instead of Paragraph 3.5.2, apply the following requirements:
 - a. Before cutting ends to length, shop assemble ends of members to be field connected by welding in the laydown position (placed to grade from bearing to bearing).

- b. To align field splices vertically, match-cut adjoining ends while in the laydown position and matchmark the ends at the center point of the web section.
 - c. Check rolled shapes with ends to be field welded before beginning fabrication in order to take into consideration allowed mill tolerances on web-center-line-to-flange measurements. Pair shapes to provide the best possible alignment.
2. **Paragraph 3.10.1.** Instead of Paragraph 3.10.1, apply the following requirements:
- a. Remove slag from welds immediately after completing each weld. Do not further clean or paint welds to be encased in concrete.
 - b. For welds connecting swaybracing members to steel piling that are to be painted according to Subsection 535.3.05.E, “Paint Steel H-Piling, Metal Shell Piling, and Steel Swaybracing” and Subsection 535.3.05.F, “Apply Special Protective Coatings to Steel Piling, Steel Swaybracing, and Concrete Piling,” remove the slag and do not clean any further.
 - c. Clean and paint other welds as specified below.
 - d. After removing slag and after completing visual, ultrasonic, or magnetic particle inspection, either blast-clean or scrub welds with water and a stiff brush. Ensure that weld areas are clean and free of spatter, rust, loose scale, oil, and dirt.
 - e. Prime welds on the same day they are cleaned, using the prime coat specified on the Plans or in the Special Provisions. When using water to clean, ensure that the surface is dry before painting. Clean and prime welds as soon as practical after the weld is accepted and before the weld area rusts.

3. **Paragraph 4.30.1.** Instead of Paragraph 4.30.1, apply the following requirements:

After welding studs to beams, visually inspect the studs and give a random number of them a light blow with a hammer. Strike the following with a hammer and bend them 15 degrees from the correct installation axis:

- Studs that do not show a full 360-degree weld fillet.
- Studs that do not ring when given a light blow with a hammer.
- Studs that have been repaired by welding.

In case of a defective or repaired weld, bend the stud 15 degrees in the direction that places the defective portion of the weld in the greatest tension.

Replace studs that crack (either in the weld, base metal, or the shank) during inspection or subsequent straightening. See paragraph 4.30.4.

On studs that must be replaced, the Contractor may manually weld the stud with the following fillet welds:

Stud Size	Fillet Weld
3/4 in (19 mm)	Full 360 degrees–1/4 in (6 mm)
7/8 in (22 mm)	Full 360 degrees–5/16 in (8 mm)
1 in (25 mm)	Full 360 degrees–5/16 in (8 mm)

501.3.05 Construction

A. Straightening Material

The Engineer may permit straightening of plates, angles, other shapes, and built-up members if the straightening is minor and can be accomplished in the field. Use only methods that do not injure the metal.

- 1. **Heat Straightening.** When the Engineer allows it, heat-straighten metal as follows:
 - a. Ensure that parts to be heat-straightened are free of stress and external forces. The exception is stresses from the mechanical means used to apply the heat.
 - b. Carefully apply a limited amount of localized heat under supervision:

- 1) Heat the area to no more than 1150 °F (620 °C) as measured by temperature-indicating crayons, liquids, or bimetal thermometers.
- 2) Cool the metal slowly after heating.

After the metal cools naturally to 600 °F (315 °C), the Contractor may use air-mist spray cooling.

- c. After straightening a bend or knuckle, have the Engineer carefully inspect the metal surface for evidence of fracture and for general acceptability.

B. Erection

Proposed erection methods are subject to the Engineer's review. Even with this review, assume responsibility for providing adequate and safe methods and for carrying out the work according to the Plans and Specifications. Begin erection only after the Engineer's review.

1. Assemble Parts in the Field

Before assembly, clean surfaces that will permanently contact each other.

Assemble parts accurately, following the match marks, according to the Plans and the erection diagram shown in the Shop Drawings.

Do not hammer if it will injure or distort the members.

Ensure that fitting-up and drifting done during field assembly and connection meet the requirements of Subsection 501.3.04.E.6, "Fitting Up."

2. Erect Beam and Girder

Before making field connections (bolting or welding) on continuous beams or girders, adjust splice joints to the correct elevations and slopes and properly align the beams.

The Contractor may make beam and girder splices on the ground if using the proper blocking to give adjoining sections the correct relative slopes.

3. Place Anchor Bolts and Adjust Nuts

Unless otherwise shown on the Plans, provide formed holes for anchor bolts. Set the bolts using an approved nonshrinking mortar. Place anchor bolts as follows:

- a. After erecting structural steel, drop the bolt into the dry hole to ensure that it fits properly.
- b. Remove the bolt and fill the hole approximately two-thirds full with an approved nonshrinking mortar the consistency of thick paint.
- c. With even pressure or light hammer blows, force the bolt down until:
 - 1) Mortar rises to the top of the hole.
 - 2) The anchor bolt nut and washer rest firmly against the metal flange, plate, shoe, or pedestal.
 - 3) The bolt has the correct projection above the top of the concrete bearing area.
- d. Remove excess mortar flushed from the hole down to the concrete bearing area.
- e. Clean holes or slots and metal surfaces in order to field paint surfaces properly and to allow moving parts to expand and contract without restraint.
- f. Tighten nuts on anchor bolts that pass through beam and girder flanges or through sole plates attached to flanges as follows:
 - 1) At both fixed and expansion ends, tighten nuts and bolts to bear on the washer and then back off one full turn.
 - 2) Draw nuts on other anchor bolts down to a tight fit.
 - 3) Do not burr anchor bolt threads.

- g. Adjust the horizontal locations of the anchor bolts relative to the midpoint of slotted holes in bottom beam flanges according to the ambient temperature at bolt placement. This allows the beam and its attached bearing components to expand or contract in the future.
- h. Do not grout anchor bolts within a complete unit until beam splicing within the unit is complete.

4. Erect Steel Joints

Erect steel joints so that the surface in the finish grade plane (laterally and longitudinally) is true and free of warping. Keep joints from moving out of their correct position during concrete placement.

Cut loose temporary connections as soon as possible to avoid restraining expansion and contraction.

Note that openings shown on the Plans are based on an erection temperature of 60 °F (15 °C). Make corrections in the opening size for the actual erection temperature, and maintain the required opening.

5. Connect Pins

Furnish pilot and driving nuts at no additional cost to the Department. Drive pins so that members take full bearing. Provide pin nuts and run them up tight. Burr the threads at the face of the nut.

6. Misfits

Correct misfits by reaming, cutting, and chipping during erection.

Immediately report to the Engineer errors that occur in shop fabrication or deformations from handling and transportation that prevent assembling and fitting up parts properly. The Engineer must approve the correction method.

Assume responsibility for misfits, errors in fabrication, and damage. Make corrections or replace parts at no additional cost to the Department.

C. Finishing Bearing Areas

1. Steel on Concrete

Unless otherwise required, level and finish bearing areas with a Type IV—Floated Surface Finish according to Subsection 500.3.05.AB.5, “Type IV—Floated Surface Finish.”

- a. Finish so that steel joint members, shoes, and bearing plates have full and uniform bearing.
- b. Correct improperly finished areas by approved means.
- c. Ensure that shoes and plates are on the correct alignment and elevation.
- d. Unless otherwise provided, place shoes and plates on layers of canvas (cotton duck) and red primer that conforms with Subsection 870.2.01.A.1, “No. 1A, Red Primer” as follows:
 - 1) Coat the bearing area surface with red primer.
 - 2) Place three layers of at least 8 oz (227 g) duck and coat each layer’s top surface with red primer.
 - 3) Position shoes or plates on the top layer of duck while red primer is still plastic.
 - 4) Instead of red primer—saturated duck, the Contractor may substitute thin pads of an approved type and thickness.

2. Steel on Steel

Prepare bearing areas as follows:

- a. Ensure that sole and bearing plates, rockers, and shoes that are designed to bear on one another fit with full bearing.
- b. Keep contact areas free of dirt, grit, and other foreign matter.
- c. Prepare machined surfaces that have been shop-coated according to Subsection 501.3.04.D.9, “Coating Machine-Finished Steel Surfaces” and that will be exposed after erection as follows:
 - 1) Remove the shop coating.

- 2) Replace the coating with the same paint system used on structural steel components.
3. Steel on Self-Lubricating Bronze Plates
Prepare machined surfaces that have been shop-coated according to Subsection 501.3.04.D.9, “Coating Machine-Finished Steel Surfaces” and that will be in contact with self-lubricating bronze plates or bushings as follows:
 - a. Remove the shop coating.
 - b. Coat the surface with stick lubricant or liquid furnished by the manufacturer of the self-lubricating bronze material.
4. Steel on Elastomeric Pads
Place elastomeric pads on concrete bearing areas that have the Type IV—Floated Surface Finish specified in Subsection 500.3.05.AB.5, “Type IV—Floated Surface Finish,” unless otherwise required.
Ensure that plates that will contact elastomeric pads meet the “no paint” requirements of Subsection 535.3.05.C.5.e, “Plates That Touch Elastomeric Pads.”

D. Field Painting

Field paint according to Section 535 using the paint system required by the Plans or Special Provisions. See also Subsections 501.3.05.C.2, “Steel on Steel,” and 501.3.05.C.4, “Steel on Elastomeric Pads.”

E. Assembly

Allow only enough drifting during assembly or field connections to bring the parts into position. Ensure that drifting does not enlarge or distort holes.

Follow these requirements when shop assembling components.

1. Normal Assembly
Do normal shop assembly as follows:
 - a. Unless otherwise specified, and before reaming, assemble each individual, full-length continuous beam, tower face, bent, rigid frame, or plate girder in the shop.
 - b. Subpunch or subdrill and ream bolt holes in field connections and splices according to Subsection 501.3.04.E.1, “Full-Size Punched Holes,” and Subsection 501.3.04.E.2, “Subpunched and Subdrilled Holes,” while assembled in the shop.
 - c. Obtain approval of the assembly, including the camber, alignment, accuracy of holes, and faced joints.
 - d. On holes for the field connections of the ends of floor beams and stringers, do one of the following while members are assembled:
 - Subpunch and ream the holes
 - Ream to a steel template
2. Complete Assembly
When the Contract requires, make the complete shop assembly of an entire structure or a portion of it, including the floor system.
3. Partial Assembly
When authorized by the Engineer or Inspector, modify the shop assembly requirements above to permit partial shop assembly as follows:
 - a. For plate girders, continuous beams, rigid frames, and columns of bents and towers, assemble at least three abutting sections.
 - b. When the Plans require that the ends of compression members be faced, assemble these members with faced ends in full bearing.

4. Reaming and Drilling Through Templates

Ream and drill through templates as follows:

- a. Use steel templates with hardened steel bushings in holes accurately dimensioned from the center lines of the connection (inscribed on the template) and from the finished end of the template.
- b. Use center lines to accurately locate the template from the milled or scribed ends of members.
- c. Use exact duplicate templates to ream matching members or the opposite faces of any one member.
- d. Accurately locate templates for connections on like members so that like members are duplicates and require no match-marking.
- e. Full-size ream or drill field connections through templates after locating the templates by position and angle and bolting the templates firmly in place.
- f. When using templates to ream field connections of web members of a bent, tower, or girder, do the following:
 - 1) Face or scribe at least one end of each web member normal to the long axis of the member.
 - 2) Accurately set the templates at both ends from the faced or scribed end.

5. Match-Marking

According to the erection diagram, match-mark connecting parts assembled in the shop to ream holes in field connections.

501.3.06 Quality Acceptance

A. Testing and Inspection

1. Heat Number Testing

The Department will sample and test each heat number that structural steel is furnished from to fabricate main members.

To facilitate this testing, ship one piece from each heat of main member structural steel to the fabrication site. Provide pieces long enough to take a properly oriented, representative, 4 x 12 in (100 x 300 mm) sample. This may require that the extra length pieces be 4 or 12 in (100 or 300 mm) longer, depending on testing orientation requirements.

2. Fastener Assembly Testing

Upon receiving HTS fastener assemblies (bolts, nuts, and washers), notify the Inspection Services Branch of the Office of Materials. The branch will verify that the Contractor has the documentation required by Subsection 852.2.03, "High Tensile-Strength Bolts" and sample the assemblies as necessary.

3. Bolted Construction Inspection

The Inspector will check the following before or during the bolting operation. Provide the Inspector easy access to the areas of the member to be inspected.

The Inspector will:

- a. Verify that bolt tension calibrators have been calibrated within the last year. Ensure that the manual torque wrenches have been calibrated at least daily for each diameter, length, and grade as shown in this Specification.
- b. Ensure that bolts are routinely installed to the proper tensions. After inspection, no further evidence of proper bolt tension is necessary.

If installation tension verification is necessary subsequent to installation and tightening of bolts, notify the Inspection Services of the Office of Materials.

- c. Monitor the surface condition and storage of bolts, nuts, and washers. See Subsection 501.2.01.A, "Fasteners," for storage requirements.
- d. Ensure that each bolting crew member understands the procedure for snug-tightening the joint and can demonstrate this knowledge by tightening a fastener in a bolt-tension calibrator.

- e. Witness the installation method verification procedure and ensure that the same conditions exist during the job-site tightening.
- f. Witness fastener installation to ensure proper tightening. This monitoring will verify that plies of connected material are drawn together and that the procedure for snug tightening is followed.
- g. Witness the final tightening procedure and mark at least two bolts in each connection to verify that further tightening (from the snug tight position) produces the rotation specified in Table B: Nut Rotation from Snug Tight.

4. Material Application and Traceability Verification

In addition to the requirements specified in Subsection 501.3.04.C, “Identifying Steel,” the fabricator shall demonstrate by written procedures and by actual practice a material application and traceability method for the main stress-carrying elements of a shipping piece. The method must be visible at least through the fit-up operation.

The traceability method shall verify proper material application as it relates to the following:

- Material specification designation
- Heat number
- Material test reports for special requirements

5. Mill and Shop Inspection

Give two weeks’ notice to the Department’s State Materials Engineer (the Materials Engineer) before beginning mill or shop work so that inspection arrangements can be made. Inspection at the mill or shop is intended to facilitate work and avoid errors and does not relieve the Contractor of the responsibility for imperfect material or work quality.

Do not roll or fabricate material until:

- You inform the Materials Engineer where the orders have been placed.
- The inspection is arranged or waived.

Furnish the facilities necessary for the inspection of materials and work quality in the mill and shop. Allow Inspectors free access to the necessary mill and shop locations, and cooperate with the Inspector during inspection.

Shop inspection is required for steel and other metal materials being fabricated.

Inspectors will do the following:

- a. Determine if steel members, member components, or other fabricated steel components meet the Plans and Specifications.
- b. Identify the steel by color code and correlate its heat numbers obtained from certified mill test reports

NOTE: Do not cut steel or apply prime paint until the Inspector completes this step.

- c. Check fabrication, especially the grade of steel, dimensions, welding, and bolting
- d. Perform necessary non-destructive testing to determine conformance with the Specifications and Plans.
- e. Reject materials or work that does not meet the Specifications.

NOTE: Even if the Inspector accepts materials or members, they can be rejected later if found defective. Promptly replace or repair rejected material or members at no additional cost to the Department.

B. Quality of Work and Finish

Provide quality work and finish on shop work. Ensure that shearing, flame cutting, and chipping are neat and accurate. Neatly finish all parts of the work.

C. Welded Construction

1. Inspection

An Inspector will be assigned to the fabrication shop for as much time as the State Materials Engineer deems necessary. The State's Inspector or authorized representative will inspect fabrication phases that include, but are not limited to, the following:

- Certification and transfer of heat numbers and grade steel
- Dimensions and assembly
- Inspection and testing of shop welds
- Non-destructive testing
- Painting
- Random sampling
- Stamp of shop inspection

2. Quality Control

Assume the following quality control responsibilities for non-fracture critical and fracture critical members and their components:

- a. Perform 100-percent nondestructive radiographic or ultrasonic testing of full penetration welds before offering the welds to the State for quality assurance inspection.
- b. Perform magnetic particle testing of fillet welds according to ANSI/AASHTO/AWS D 1.5.

3. Qualification

Qualify shop weld procedures and welders according to ANSI/AASHTO/AWS D 1.5. The Engineer may accept tests conducted by other states as evidence of qualification. In the absence of approved shop weld procedures, welding operator and welder qualifications, qualify with the State Materials Engineer as follows:

- a. In the presence of the Engineer's representative, prepare test plates according to ANSI/AASHTO/AWS D 1.5.
- b. Requalify according to ANSI/AASHTO/AWS D 1.5 or whenever the Engineer requires. A new welding procedure qualification is not needed at the start of each new Project.

4. Testing

Furnish labor and equipment to do the following:

- Position welds for magnetic particle testing
- Help transport ultrasonic equipment
- Provide the Inspector easy access to testing areas

The Inspector's access to work in the shop and field is top priority.

The Department of Transportation, in its routine quality assurance inspection, will ultrasonic or magnetic-particle test approximately 25 percent of the welds.

If testing indicates faulty work, the Inspector will immediately notify the Contractor of the necessary corrective work. Ensure that welders are available to repair faulty work as soon as practical.

- a. **Non-destructive Testing.** If weld cracking occurs, non-destructive testing for Final Acceptance of fillet and groove welds may be delayed to:
 - Within 24 hours after welding has been completed for material 2 in (50 mm) or less
 - Within 48 hours after welding has been completed for material over 2 in (50 mm).

The fabricator may use, at its expense, nondestructive testing methods other than those specified to examine weld passes or completed welds. Refer to ANSI/AASHTO/AWS D 1.5.

- b. **Ultrasonic Testing.** Unless otherwise specified on the Plans or in Special Provisions, test butt welds in main members by the ultrasonic method.

In addition to the testing requirements of the Plans, Specification, and Special Provisions, the Engineer may require ultrasonic testing if the quality of the work warrants it.

5. Walkways for Field Testing

When field testing, provide a continuous walkway between the center-most line of stringers from one of the approach fills to the farthest row of splices as follows:

- a. Provide crosswalks connecting with the center line walkway at each butt-welded splice or bolted connection on each row of stringers.
- b. Rest working platforms on the top side of the bottom flange with supporting braces fitting flush against the web.
- c. Provide at least 18 in (450 mm) of clearance on each side of the welded splice or bolted connection. Ensure that the top of the working platform is no more than 3 in (75 mm) above the top side of the bottom flange.
- d. Construct walkways and working platforms of sound materials. If constructing with wood, use wood free of excessive knots or knots that could cause an unsafe condition.
- e. Construct walkways at least 20 in (500 mm) wide and long enough to permit each end to rest on a fixed part or member of the bridge.
- f. Ensure that walkways have a vertical support at least every 10 ft (3 m).
- g. Construct working platforms at least 36 in (900 mm) wide and long enough to permit each end to rest on a fixed part or member of the bridge.
- h. When a deck already exists from the end bent out to the splices, do not construct a separate walkway unless the deck reinforcement steel has been put in place.
- i. Do not allow deck forms to be placed within 18 in (450 mm) of splices until the welds or bolted connections have been inspected and accepted.

6. Tolerances

For built-up members, the requirements of paragraph 3.5.1.7 of ANSI/AASHTO/AWS D 1.5, as modified, apply except at ends to be field connected by welding. The combined warpage and tilt tolerances shall be one-half that specified.

For rolled shapes, apply mill practice tolerances (ASTM A 6/A 6M) except at ends to be field connected by welding. The combined warpage and tilt tolerances shall be one-half that specified.

Use the above tolerances unless there are deviations that are additive when measured at the toe. In this case, ensure that the maximum offset between adjoining flanges does not exceed 1/4 in (6 mm).

501.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

501.4 Measurement

Structural steel will be measured either per pound (kilogram) or per Lump Sum.

- **Per pound (kilogram) basis.** The quantity of structural steel to be measured for payment will be the net weight of metal in the completed and accepted structure.

A unit weight of 490 lbs/ft³ (7850 kg/m³) will be used to calculate the net weight of steel. The weights of rolled shapes or plates will be computed based on their nominal weight per foot (meter) as listed in standard handbooks such as the AISC Manual of Steel Construction.

- **Lump sum basis.** When the Plans specify a Lump Sum basis, this work will be measured as an accepted Lump Sum quantity, complete in place. Tabulated quantities are shown on the Plans as a service, but they do not relieve the Contractor of conforming to Plan details. If the Plan details and tabulated quantities differ, the Plan details will govern. The Contractor shall determine the actual quantities required before submitting a bid.

501.4.01 Limits

A. Qualification

Assume the cost of qualification tests and test sample preparation required under these Specifications. This cost is considered incidental to The Work.

B. Testing

Ultrasonic or magnetic-particle testing by the Department of Transportation under its quality assurance inspection rate of approximately 25 percent of welds will be performed at no cost to the Contractor.

The Contractor shall assume the cost of additional ultrasonic or magnetic-particle testing above the 25 percent rate to determine the extent of weld defects and to check corrected work. The rate for this extra testing will be \$75 per hour for the Inspector, equipment, travel, and subsistence.

If the Contractor is equipped with satisfactory ultrasonic or magnetic-particle inspection equipment, the Contractor may test the Work corrected in the shop at no additional expense to the Department, but the Engineer will interpret the ultrasonic and magnetic-particle inspection.

501.5 Payment

This work will be paid for at the Contract Price per pound (kilogram) of structural steel or per Lump Sum, each complete in place. The Contract Price for structural steel includes the costs of labor and equipment and the direct or incidental costs of furnishing easy access for inspection and testing.

Payment will be made under:

Item No. 501	Structural steel, Bridge No. _____	Per lump sum
Item No. 501	Structural steel	Per lb (kg)
Item No. 501	Structural steel-swaybracing	Per lb (kg)

501.5.01 Adjustments

A. Payment Conditions

The cost of steel joints and metal bearing assemblies used in structures with no structural steel Pay Item shall be included in the Contract Price for superstructure concrete, unless otherwise shown on the Plans.

When authorized changes are made, the Lump Sum payment will be adjusted on a negotiated basis.

On projects with multiple bridges, payments will be applied on an individual bridge basis.

Upon satisfactory completion of the erecting, bolting, and welding of structural steel for the bridge, 95 percent of the Contract Price, either per Lump Sum Basis or per pound (kilogram) basis, will be included for payment on the next statement.

Steel spans are considered satisfactorily erected when they are placed in their final positions on the substructure, properly spaced, and anchored down. Bolting is considered satisfactorily complete when defective welds are repaired and found satisfactory by additional inspection.

Upon satisfactory completion of field painting, the remaining 5 percent of the Contract Price will be included for payment on the next statement.

Material allowance payments of structural steel will be determined and paid for in accordance with the requirements of Section 109.

Section 502—Timber Structures

502.1 General Description

This work consists of constructing timber bridges and other timber structures complete in place.

502.1.01 Definitions

General Provisions 101 through 150.

502.1.02 Related References

A. Standard Specifications

Section 501—Steel Structures

Section 520—Piling

Section 645—Repair of Galvanized Coatings

Section 852—Miscellaneous Steel Materials

B. Referenced Documents

AWPA Standard M4, “Standard for the Care of Preservative Treated Wood Products”

502.1.03 Submittals

General Provisions 101 through 150.

502.2 Materials

All materials shall meet the requirements of the following Specifications:

Material*	Section
Lumber and Timber	860
Piling and Round Timber	861
Preservative Treatment of Timber Products	863
Miscellaneous Metals	858
Structural Steel	851
Plain Cotton Duck	881
Miscellaneous Steel Materials	852
Paint	870

*Insofar as practicable, all cutting, framing, and boring of treated timber shall be done before treatment.

A. Miscellaneous Hardware

Galvanize the following items according to Subsection 852.2.04.B.3, “Galvanizing”:

- Bolts
- Nuts
- Washers
- All hardware including (but not limited to) special couplings, dowels, and spikes

Repair damaged galvanized coatings according to Section 645.

Nails may be black or galvanized.

B. Structural Purposes and Grades

Lumber and timber meeting the requirements given in Table 1 of Section 860, “Lumber and Timber”, shall be used for the structural purposes shown therein.

502.2.01 Delivery, Storage, and Handling

A. Handling Timber

Handle timber carefully without dropping it, breaking the outer fibers, bruising it, or piercing it with tools.

Handle timber with non-metallic slings.

B. Storing Materials

Place all stored material in well-drained locations and keep these locations free from weeds and rubbish.

Comply with the following material-specific storage guidelines:

1. Untreated Timber and Piling

Store untreated materials as follows:

- a. Open stack the materials at least 12 in (300 mm) above the ground.
- b. Pile the materials so water can run off them to prevent warping.
- c. Protect the materials with durable waterproof covering approved by the Engineer.

2. Treated Timber and Piling

Close stack treated materials at least 12 in (300 mm) above the ground and pile them to prevent warping.

3. Timber After Fabrication

Store this timber so the members do not change dimensions before they are assembled.

4. Hardware and Miscellaneous Metal

Place metal material in covered storage and protect it from rust and other damage.

502.3 Construction Requirements

General Provisions 101 through 150.

502.3.01 Personnel

General Provisions 101 through 150.

502.3.02 Equipment

General Provisions 101 through 150.

502.3.03 Preparation

General Provisions 101 through 150.

502.3.04 Fabrication

General Provisions 101 through 150.

502.3.05 Construction

A. Making Field Repairs and Applying Treatments and Coatings

Make field repairs and apply treatments and coatings as follows:

1. Repair and Apply Treatments to Treated Timber

Carefully trim cuts and abrasions in creosoted timber or piles and treat them with either of the following:

- Two hot applications of 60 percent creosote oil mixed with 40 percent roofing pitch
- Two thorough brush coats of hot creosote oil followed by a covering of hot roofing pitch

For field treatment of other preservatives, see AWPA Standard M4 entitled, “Standard for the Care of Preservative Treated Wood Products.”

a. Bolt Holes

Treat bolt holes with creosote oil using an approved, manufacturer-recommended, pressure bolt hole treater. After the treatment, plug unfilled holes with creosoted plugs.

b. Temporary Holes

When the approved use of temporary forms or braces results in nail or spike holes in treated timbers or piles, fill these holes by driving galvanized nails or spikes flush with the surface or by plugging as specified in Subsection 502.3.05.A.1.a, “Bolt Holes.”

c. Countersunk Holes

Treat these holes with hot creosote oil before placing the bolts. After placing the bolts, fill the holes with hot roofing pitch.

2. Apply Treatment to Pile Heads

See Subsection 502.3.05.J, “Repair and Treat Timber Piling,” step 5.

B. Framing

Cut and frame lumber and timber to a close fit so the joints will have an even bearing over the entire contact surface. The Department does not permit shimming or open joints.

Match-mark timbers requiring an exact fit.

1. Meet Workmanship Requirements

Ensure that workmanship meets the following standards:

a. Nails and Spikes

Drive nails and spikes hard enough to set their heads flush with wooden surfaces. Replace bent nails or spikes.

The Department considers deep hammer marks on wooden surfaces poor workmanship. The Department may reject the work with these characteristics.

b. Steel Plates and Structural Shapes

Workmanship on steel plates and structural shapes shall meet the requirements of Section 501.

2. Drill Holes for Bolts, Dowels, Rods, and Lag Screws

Drill holes with the following diameters to receive these hardware items

Hardware	Hole Diameter
Round drift bolts and dowels	1/16 in (2 mm) smaller than the diameter of the hardware
Square drift bolts and dowels	Same as the smallest dimension of the hardware
Machine bolts	Same as the diameter of the hardware
Rods	1/16 in (2 mm) larger than the diameter of the hardware
Lag Screws	No larger than the body of the screw at the base of the thread

Countersink holes wherever smooth faces are required.

3. Use Bolts and Washers

Use washers of the size and type specified on the Plans under bolt heads and nuts to prevent them from contacting the wood.

After completely adjusting the nuts, do the following:

- a. Cut the excess length off of bolts projecting more than 1 in (25 mm) beyond the nuts.

- b. Burr the bolt threads.
- c. Coat the bolt ends with galvanizing repair compound according to Section 645.

C. Constructing Timber Substructures

Construct the timber substructure as follows:

1. **Drive the Pile Bents.** See Section 520.3.05.E, “Drive Piling.”
2. **Place the Caps.** Place timber caps so the bearing on their supports is evenly secured and their ends are evenly aligned. Drift bolt the caps to piles and posts.
3. **Bolt the Bracing.** Bolt timber braces where they intersect with piles and posts.

D. Constructing Timber Superstructures

Construct the timber superstructure as follows:

1. **Install Stringers.** Install stringers using these guidelines:
 - Where stringers bear over the width of floor beams and caps, size the stringers to a uniform grade.
 - Ensure that lapped ends of treated stringers contact each other.
 - Neatly and accurately frame cross-bridging between stringers.
 - Securely toenail the cross bridging by driving at least two nails in each end.
2. **Lay Single Plank Floors.** Lay these floors using these guidelines:
 - Lay planks with the adjacent planks drawn together tightly.
Lay the plank so the thickness of adjacent planks varies by no more than 1/16 in (2 mm).
 - Spike each plank to each joist or nailing strip using at least two spikes.
The spike length shall be at least 3 in (75 mm) greater than the thickness of the planks.
 - Carefully grade the plank thickness.
3. **Lay Laminated or Strip Floors.** Lay these floors using these guidelines:
 - Dress strips to a uniform thickness of no more than 3 in (75 mm) and to a uniform width when specified on the Plans.
 - Place strips on the edge and at right angles to the roadway center line.
 - Spike each strip to the adjacent strip at 2 ft (600 mm) intervals by staggering succeeding spike locations 8 in (200 mm) from preceding locations.
Ensure that the spike length is sufficient to pass through two strips and at least halfway into the third.
 - Toenail strips to the stringers with 20 d (4 mm) nails.
Instead of toenailing, the Contractor may drive spikes vertically through the strip if they penetrate the stringer at least 3 in (75 mm).
4. **Frame and Erect Hub Guards and Railings.** Accurately frame and erect hub guards, scupper blocks, joist blocks, and railings to true line and grade. Use these guidelines when erecting hub guards and railings:
 - Dress hub guards, scupper blocks, railings, and rail posts on all four sides.
 - Securely spike the scupper blocks in place.
 - Bolt the hub guards through the scupper blocks, floor planks, and, if required, through the outside joists or nailing pieces.
 - Lay hub guards in sections at least 12 ft (3.7 m) long.

502.3.06 Quality Acceptance

General Provisions 101 through 150.

502.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

502.4 Measurement

A. Structural Metal

Plates and structural shapes required on the Plans will be measured for payment as specified on the Plans only when set up as a Specified Pay Item. Measurement will then be made as provided in Subsection 501.4, "Measurement," and the cost shall not be included in the Contract prices for lumber and timber.

Otherwise, no separate measurement for payment will be made, and the cost shall be included in the Contract prices for lumber and timber.

B. Lumber and Timber

Lumber and timber will be measured per thousand feet(cubic meter) board measure (MBM). Quantities in the structure will be computed based upon nominal sizes and the actual length in place.

502.4.01 Limits

A. Timber Piling

Timber piling shall be furnished, driven, and measured as a Pay Item under Section 520 unless otherwise specified.

B. Splices

No additional measurement will be made for splices except for overlaps shown on the Plans.

C. Hardware

No separate measurement for payment will be made for items such as the following:

- U-bolts
- V-bolts
- Oval head bolts
- Special couplings
- Bolts
- Nuts
- Washers
- Dowels
- Nails
- Spikes
- Other hardware.

The cost of these items shall be included in the Contract Unit Price bid for timber.

502.5 Payment

A. Structural Metal

The quantity of structural metal (determined as described below in Subsection 502.4.A "Structural Metal", will be paid at the Contract Price according to Subsection 501.5, "Payment" for Steel Structures.

B. Lumber and Timber

Lumber and timber will be paid for at the Contract Unit Price bid per thousand feet board measure (MBM) (cubic meter), complete in place and accepted. The payment will be full compensation for material, labor, and equipment necessary to complete the Work as shown on the Plans and as described in this Specification. Payment includes incidentals and all costs, both direct and indirect.

Payment will be made under:

Item No. 502	Bridge timber (untreated)	Per MBM (cubic meter)
Item No. 502	Bridge timber (treated)	Per MBM (cubic meter)

502.5.01 Adjustments

General Provisions 101 through 150.

Section 503—Four Hour Accelerated Strength Concrete

503.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 504—Twenty-Four Hour Accelerated Strength Concrete

504.1 General Description

This work consists of manufacturing and placing accelerated strength concrete designed to produce a compressive strength of 2,500 psi (17 MPa) within 24 hours.

Except as modified in this Specification, the provisions of Section 500 shall apply to concrete produced and placed under this Specification.

504.1.01 Definitions

General Provisions 101 through 150.

504.1.02 Related References

A. Standard Specifications

Section 109—Measurement and Payment

Section 500—Concrete Structures

B. Referenced Documents

AASHTO M 194, Type E, Table I

504.1.03 Submittals

A. Approve Chemical Admixture for Concrete

Ensure that the manufacturer submits an affidavit that the chemical admixture for concrete meets the requirements of AASHTO M 194, Type E, Table I.

B. Establish Concrete Mix Proportions

Choose one of the following two procedures for establishing concrete mix proportions for concrete placed under this Specification.

Notify the Engineer of the chosen procedure at least 45 days before placing the concrete.

1. Concrete Mix Proportions Established by the Contractor

The Contractor may propose specific concrete mix design proportions for concrete placed under this Specification. In this case, the Contractor shall meet these requirements:

- a. Ensure that all materials are from approved sources or from materials stored or stockpiled at the site.
- b. Have all materials tested before they are used.
- c. Have the laboratory verify that the proposed proportions will produce concrete that develops 2,500 psi (17 MPa) within 24 hours.

Proposed mixes may be approved without laboratory design study when they include commonly used material combinations.

2. Concrete Mix Proportions Established by the Department

The Contractor may choose to have the Department establish the concrete mix proportions. However, the Department's approval of the design mix does not relieve the Contractor of the responsibility to produce concrete with the specified compressive strength of 2,500 psi (17 MPa).

The Department will establish the proportions as follows:

- a. The Contractor shall notify the Office of Materials of the proposed sources of all materials.
- b. The Department will establish the job mix proportions from materials representative of the materials proposed for use, provided all materials conform to their respective Specifications.
- c. The Office of Materials will determine the following based upon materials intended for use:
 - Minimum cement content
 - Required water content
 - Quantities of aggregate
 - Addition rates of admixtures
- d. The Department will make the proportions available as public information within one month after the Contractor proposes the material sources.
- e. The Department will not allow materials to be substituted after releasing an approved design unless the Office of Materials approves of the substitution.

The Department will base job mix design proportions upon the following table:

Minimum Cement cwt/cu yd (kg/ m³)	Maximum Water Cement Ratio lbs/ lbs (kg/kg)	Minimum Compressive Strength at 24 Hours psi (MPa)	Air Content (%)	Slump Range inch (mm)
7.52 (446)	0.45	2500 (17)	3 to 6	2 to 5(50 to 125)

The Department will accept initial design admixture meeting the requirements of materials established in this Specification. However, the Department will not approve any combination of admixture and cement that produces undesirable characteristics of set time or strength development.

504.2 Materials

All materials shall meet the requirements of the following Specifications:

Section 504-Twenty-Four Hour Accelerated Strength Concrete

Material	Section
Portland Cement (Type I or Type III)	830.2.01
Air-Entraining Admixtures	831.2.01
Coarse Aggregate, Class A or B, Gravel or Stone	800.2.01
Fine Aggregate, Size No. 10	801.2.02
Chemical Admixtures	831.2.02
Calcium Chloride	884.2.01
Water	880.2.01

The concrete acceleration admixtures may be either of the following:

- Calcium chloride
- A chemical admixture

The Engineer must authorize chemical admixtures before they are used for concrete. Admixtures will be approved only if an acceptable concrete design is established in the laboratory with materials representative of those proposed for use.

Do not use accelerators containing chlorides in prestressed concrete; or, in bridges or box culverts when the concrete containing the additive will contact the reinforcement steel

504.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

504.3 Construction Requirements

General Provisions 101 through 150.

504.3.01 Personnel

A. Quantity of Personnel

Provide enough labor to place, consolidate, and screed each batch of concrete within one hour after introducing the cement and first mixing water into the mix.

Do not place concrete when there are not enough personnel to meet this requirement.

504.3.02 Equipment

A. Quantity of Equipment

Provide enough equipment to place, consolidate, and screed each batch of concrete within one hour after introducing the cement and first mixing water into the mix.

Do not place concrete when there is not enough equipment to meet this requirement.

B. Portable Mixers

The Engineer may approve portable mixers when placement quantities at a given location are less than one cubic yard (meter).

504.3.03 Preparation

General Provisions 101 through 150.

504.3.04 Fabrication

General Provisions 101 through 150.

504.3.05 Construction

A. Batch and Mix Materials

1. Transit-Mixed Concrete

When transit-mixed concrete is used for concrete containing an acceleration admixture, do the following:

- a. At the plant, mix the concrete ingredients, excluding the acceleration admixtures and 3 gal (15 L) of withheld water per cubic yard (meter) of concrete, at mixing speed for 35 revolutions of the drum.
- b. Mix the concrete enroute to the job site at an agitating speed of no more than three revolutions per minute.
- c. At the job site, add the acceleration admixture and withheld mixing water to the concrete according to these requirements:
 - 1) The Engineer will approve the method of adding the acceleration admixture and withheld mixing water.
 - 2) The Contractor shall measure the admixture into the concrete with an accuracy of plus or minus three percent.
 - 3) The Contractor shall not add accelerating admixture to concrete that has attained the age of 45 minutes as measured from the beginning of the initial mixing at the plant.
- d. Mix the concrete for 40 additional revolutions at mixing speed.

2. Central-Mixed Concrete

When central-mixed concrete is used for concrete containing an acceleration admixture, do the following:

- a. Shrink-mix all concrete ingredients, excluding acceleration admixture and 2 gal (10 L) of withheld water per cubic yard (cubic meter), in the central mixer.
- b. Mix the above ingredients enroute to the job site at agitating speed.

All other provisions of Subsection 504.3.05.A.1, "Transit-Mixed Concrete," shall apply for adding the acceleration admixture and mixing the concrete at the job site.

B. Cure Concrete

Cure the concrete according to Subsection 500.3.05.Z, "Cure Concrete," except that the Engineer may waive the concrete curing period when test results indicate the compressive strength exceeds 2500 psi (17 MPa).

All provisions of Subsection 500.3.05.X, "Pour Concrete in Cold Weather," shall apply except that the protection requirements in step 2 of Subsection 500.3.05.X may be suspended when test results indicate the compressive strength exceeds 2500 psi (17 MPa).

504.3.06 Quality Acceptance

A. Compressive Strength Testing

Compressive strength testing are conducted as follows:

- 1. Georgia DOT personnel will cast four test cylinders for each day of concrete placement.
- 2. Georgia DOT personnel will store the cylinders on or adjacent to the pour in a moist condition.
- 3. Minimum compressive strength shall be according to either of the following for an average of two specimens

Strength development at 24 hours	2,500 psi (17 MPa)
Strength development at 3 days	3,500 psi (24 MPa)

504.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

504.4 Measurement

Twenty-four-hour accelerated strength concrete will be measured for payment by the square yard (meter) or cubic yard (meter) as indicated on the Plans and in the Proposal.

Section 504-Twenty-Four Hour Accelerated Strength Concrete

- Square yard (meter) measurements shall be as defined in Section 109.
- For structure concrete, cubic yard (meter) measurements will be the algebraic summation of the Plan quantity and any authorized quantity changes.

504.4.01 Limits

General Provisions 101 through 150.

504.5 Payment

Twenty-four-hour accelerated strength concrete will be paid for at the Contract Unit Price bid either by the cubic yard (meter) or square yard (meter) as shown on the Plans or in the Proposal.

Payment will be made under:

Item No. 504	Twenty-Four-Hour Accelerated Strength Concrete	Per cubic yard (meter)
Item No. 504	Twenty-Four-Hour Accelerated Strength Concrete	Per square yard (meter)

504.5.01 Adjustments

General Provisions 101 through 150.

Section 505—Corrugated Steel Bridge Plank

505.1 General Description

This work consists of installing bridge flooring of corrugated steel complete in place and according to the Plans and Specifications.

505.1.01 Definitions

General Provisions 101 through 150.

505.1.02 Related References

A. Standard Specifications

Section 870—Paint

B. Referenced Documents

General Provisions 101 through 150.

505.1.03 Submittals

General Provisions 101 through 150.

505.2 Materials

All materials shall meet the requirements of the following Specifications:

Material	Section
Corrugated Steel Plank for Bridges	852.2.04
Paint	870

505.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

505.3 Construction Requirements

505.3.01 Personnel

General Provisions 101 through 150.

505.3.02 Equipment

General Provisions 101 through 150.

505.3.03 Preparation

General Provisions 101 through 150.

505.3.04 Fabrication

A. In-Shop Fabrication Requirements

Fabricate plank from steel plate of the thickness shown on the plans. Form the plank to a minimum size of at least 13 in (330 mm) wide by 2 in (50 mm) deep with at least two complete corrugations. The section modulus per inch (millimeter) shall be equal to or greater than that shown on the Plans.

1. Holes for Welded Attachment to Beams

Shop-punch holes for welded attachment to beams and space the holes as shown on the Plans.

2. Painting

Shop painting shall be of the paint type and the number of coats shown on the Plans.

505.3.05 Construction

A. Installing Plank

Install the corrugated steel bridge plank as follows:

1. Place the plank as shown on the Plans.

2. Ensure that the bottom corrugations have full bearing on supporting members.

3. Hold the bottom corrugations in full contact with the supporting members until they are securely connected according to the details shown on the Plans.

B. Welding

All welds shall be of the type and size, and be placed at the location shown on the Plans. All welding shall meet the requirements of Subsection 501.3.06.C, "Welded Construction."

C. Field Painting

Apply the type of paint and the number of coats shown on the Plans according to Section 535.

505.3.06 Quality Acceptance

General Provisions 101 through 150.

505.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

505.4 Measurement

This work will be measured for payment in square feet (meters), including laps of accepted planks.

505.4.01 Limits

General Provisions 101 through 150.

505.5 Payment

This work will be paid for at the Contract Price per square foot (meter) for corrugated steel bridge plank complete in place.

Payment will be made under

Item No. 505	Corrugated Steel Bridge Plank	Per square foot (meter)
--------------	-------------------------------	-------------------------

505.5.01 Adjustments

General Provisions 101 through 150.

Section 506—Expanded Mortar

506.1 General Description

This work consists of making and placing expanded mortar composed of a special Portland cement concrete and an aluminum powder additive.

506.1.01 Definitions

General Provisions 101 through 150.

506.1.02 Related References

A. Standard Specifications

- Section 800—Coarse Aggregate
- Section 801—Fine Aggregate
- Section 830—Portland Cement
- Section 835—Aluminum Powder
- Section 880—Water

B. Referenced Documents

- General Provisions 101 through 150.

506.1.03 Submittals

General Provisions 101 through 150.

506.2 Materials

All materials shall meet the requirements of the following Specifications:

Material	Section
Portland Cement, Type I	830.2.01
Coarse Aggregate, Class A or B Stone, Size No. 89	800.2.01
Fine Aggregate, Size No. 10	801.2.02
Water	880.2.01
Aluminum Powder	835.2.01

506.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

506.3 Construction Requirements

506.3.01 Personnel

General Provisions 101 through 150.

506.3.02 Equipment

General Provisions 101 through 150.

506.3.03 Preparation

A. Using Expanded Mortar for Shear Keys

When using expanded mortar for shear keys on precast bridge decks, thoroughly clean and saturate the recesses in the precast decks with clean water before placing the mortar.

506.3.04 Fabrication

General Provisions 101 through 150.

506.3.05 Construction

Mix and use expanded mortar according to the following:

A. Proportion Expanded Mortar

Ensure that the expanded mortar consists of a fresh mixture of the composition given in the following table:

Proportions for Expanded Mortar				
Pounds (kilograms) of Portland Cement	Lbs(kgs) of Saturated Surface Dry Aggregate per Bag of Cement		Maximum Water per Bag of Cement	Quantity of Aluminum Powder
	Fine	Coarse		
94 (42.6)	140 (63.5)	140 (63.5)	6 gal (22.7 L)	1 level tsp. (5 mL)

B. Mix Expanded Mortar

Mix the materials as follows:

1. Mix the materials dry, either in a clean mixer or in a clean, tight box until a uniform mixture is produced.
2. Add enough water to produce the desired consistency, but do not add more water than specified in the "Proportions for Expanded Mortar" table in Subsection 506.3.05.A.

C. Use Expanded Mortar

Begin using the expanded mortar according to the temperature requirements in the following table:

Temperature	Required Action
> 90 °F (> 32 °C)	Use mortar within 15 minutes after mixing.
70 °F to 90 °F (21 °C to 32 °C)	Use mortar within 30 minutes after mixing.
40 °F to 70 °F (4 °C to 21 °C)	Use mortar within 30 minutes after mixing.*
*Mortar may require additional aluminum powder to secure the required expansion. Additional amounts shall range from 0% at 70 °F (21 °C) to 100% at 40 °F (4 °C) in a straight-line proportion.	

D. Place Expanded Mortar

Place the expanded mortar as follows:

1. Expanded Mortar for Shear Keys
 - a. Completely fill the shear key with mortar.
 - b. Rod the mortar into a dense, homogenous mass.
 - c. Float the mortar off flush with the surface of the precast decks.
 - d. Moist cure the mortar continuously for a minimum of three days.
2. Placement Restrictions

Do not place the mortar until after the entire bridge has been erected and all units are in final alignment.

Do not allow traffic on the bridge decks until 5 days after the expanded mortar is placed.

506.3.06 Quality Acceptance

General Provisions 101 through 150.

506.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

506.4 Measurement

Expanded mortar is not measured for separate payment.

506.4.01 Limits

General Provisions 101 through 150.

506.5 Payment

Expanded mortar will be paid for at the Contract Price for concrete of the same Class as the concrete the mortar comes in contact with, and the Contractor shall include the cost of expanded mortar in the Contract Price for such concrete.

506.5.01 Adjustments

General Provisions 101 through 150.

Section 507—Prestressed Concrete Bridge Members

507.1 General Description

This work consists of furnishing prestressed concrete bridge members, complete in place, except as noted for piling in this Specification. The work includes all items and work necessary to complete the erection according to the Plans and Specifications. All prestressed concrete bridge member nominal lengths shown on the plans are horizontal dimensions. The contractor will be responsible for adjusting the lengths, as necessary, to account for the final erected position of the member. Fabricate the ends of all members to be vertical in the final erected position. Slope bearing assemblies to accommodate the erected position of the member.

507.1.01 Definitions

PSC: Prestressed concrete. Prestressed concrete may be designated “PSC” in Specifications and on Plans and other documents.

507.1.02 Related References

A. Standard Specifications

Section 109—Measurement and Payment

Section 500—Concrete Structures

Section 501—Steel Structures

Section 506—Expanded Mortar

Section 520—Piling

Section 865—Manufacture of Prestressed Concrete Bridge Members

B. Referenced Documents

General Provisions 101 through 150.

507.1.03 Submittals

A. Erection Drawings

Furnish erection drawings to the Department only when the units are not interchangeable with respect to the following:

- Transverse placement within a span
- Longitudinal reversal within a span

The drawings shall cover superstructure unit placement, including bearing components.

B. Shop Drawings

Submit shop drawings to the Department on standard Plan size 22 in x 36 in (550 mm x 900 mm) sheets showing complete beam details of the following:

- Nonprestressed reinforcement
- The method of retaining depressed strands in place
- Calculations for determining the strand elongation required to produce the specified pretensioning force
- Detensioning schedule
- Increased length of beam due to vertical alignment

As an option, shop drawings may be submitted on plan sheet sizes of 12” x 18” (305 mm x 457 mm) or 11” x 17” (279 mm x 432 mm) for review and approval. Information contained on these sheets must be legible.

After shop drawings have been approved, submit an electronic file that is compatible with Bentley Microstation J (Version 7) Cadd operating system, or an electronic file in Adobe Acrobat Portable Document Format (.pdf) to the Engineer. For bridges carrying railroads only, after shop drawings have been approved, submit one full size set of reproducible drawings to the Department.

507.2 Materials

All materials and manufacturing methods shall meet the requirements of Section 865. Reference is also made to the following:

Material	Section
Plain Steel Bars—Threaded Ends	853.2.05
Anchor Bolts	852.2.02
Bronze Bushings, Bearings, and Expansion Plates	857
Structural Steel	851.2.01
Elastomeric Pads	885.2.01
Plain Cotton Duck	881.2.01
Rubber Impregnated Cotton Duck	881.2.02
Paint	870

Substitute materials according to Subsection 865.2.01.B.3, “Substitution of Reinforcement” and Subsection 865.2.01.B.4, “Substitution of Strands.”

507.2.01 Delivery, Storage, and Handling

A. General Delivery, Storage, and Handling

See Subsection 865.2.01, “Prestressed Concrete Bridge Members.” Replace members damaged in handling or storage (at no additional expense to the Department) unless the Engineer determines that the member is usable.

B. Handling PSC Beams

In handling PSC beams, the Contractor shall ensure that beams maintain an upright position at all times and shall pick up beams at their pickup and support points (see Subsection 865.2.01.B.14.e, “Beams”).

Disregarding this requirement could cause a bridge member to collapse.

507.3 Construction Requirements

507.3.01 Personnel

General Provisions 101 through 150.

507.3.02 Equipment

General Provisions 101 through 150.

507.3.03 Preparation

General Provisions 101 through 150.

507.3.04 Fabrication

See Subsection 865.2.01.B, “Fabrication.”

507.3.05 Construction

A. Prepare Bearing Areas

Requirements for preparing steel bearing areas for PSC bridge members will be the same as those specified in Section 501 for Steel Structures, listed below. Other requirements are also noted below:

1. Steel on Concrete

See Subsection 501.3.05.C.1, “Steel on Concrete.”

2. Steel on Steel

See Subsection 501.3.05.C.2, “Steel on Steel.”

3. Steel on Self-Lubricating Bronze Plates

See Subsection 501.3.05.C.3, Steel on Self-lubricating Bronze Plates.”

4. Steel on Elastomeric Pads

See Subsection 501.3.05.C.4, Steel on Elastomeric Pads.”

5. Concrete on Concrete

For concrete caps that PSC deck units will bear directly on, prepare bearing areas as follows:

- a. Finish the concrete caps with the Type IV—Floated Surface Finish specified in Subsection 500.3.05.AB.5, “Type IV—Floated Surface Finish.”
- b. Cover the caps with asphalt-saturated felt as noted on the Plans.

The Contractor may use felt of a lighter weight than that required on the Plans by increasing the number of layers proportionally.

6. Concrete on Timber Piling

For treated timber piles that will support PSC caps, prepare bearing areas as follows:

- a. Cut off the pile heads.
- b. Have the piles field treated as specified in Subsection 520.3.05.J, “Repair and Treat Timber Piling.”
- c. Protect the piles according to the applicable Specifications.

B. Erecting PSC Bridge Members

Erect bridge members according to the handling requirements in Subsection 507.2.01, “Delivery, Storage, and Handling,” and as follows. Refer questions concerning structural requirements to the Engineer.

1. Beams

Erect beams as follows:

- a. Erect beams in conformity with true longitudinal alignment and transverse placement as shown on the Plans or as directed by the Engineer.
- b. Ensure that the locations of fixed and expansion ends are as shown on the Plans or as directed by the Engineer.
- c. Do not weld in place structural steel bearing devices that will rest directly upon elastomeric pads while the devices are bearing against the pads.

2. Caps

Erect PSC caps as follows:

- a. Align and grade the caps according to the Plans.
- b. Drift the caps to the timber pile heads according to the Plans.
- c. Proportion and mix expanding mortar according to Section 506.

An approved mortar may be substituted for the expanded mortar as long as it is nonshrinking and commercially produced.

- d. Fill the drift pin holes with the expanding mortar according to Section 506.

3. Deck Units

Erect PSC deck units (such as flat slabs and double tees) that will bear directly on caps so that all sections have a smooth, uniform bearing on the caps.

- a. **Aligning Deck Units.** Base the final deck unit alignments on the alignment of the traffic faces of the exterior section curbs.
- b. **Shimming.** If shimming is necessary to achieve proper riding surface, grade, or proper bearing uniformity, use steel shims and cut them to the following dimensions:
 - The same shape as the area to be shimmed
 - The thickness required to produce the required elevation and load distribution
- c. **Restrictions.** If the Engineer approves deck erection procedures that involve placing heavy lifting equipment on the decks, do not place the equipment until the cap drift pin mortar reaches 3000 psi (20 MPa).

4. Shear Keys

Pour expanding mortar into shear keys between deck units as follows. The mortar shall meet the requirements of Section 506.

- a. Erect the entire bridge.
- b. Ensure that all units are in final alignment.
- c. Pour the mortar in the shear keys.
- d. Continuously moist cure the keys for at least three days.
- e. Keep traffic off the structure for at least 5 days.

5. Anchor Bolts and Nut Adjustment

Place anchor bolts and adjust nuts according to Subsection 501.3.05.B.3, "Place Anchor Bolts and Adjust Nuts."

6. Deck Grading

Make sure PSC bridge members are 45 days old before grading the bridge deck for screeding.

C. Tighten Diaphragm Bars

Tighten diaphragm bars as follows:

1. Bring the diaphragm bar nuts to a snug fit against the beams.
2. Pour the diaphragm.
3. Allow the diaphragm concrete to age at least 5 days and reach at least 1,500 psi (10 MPa).
4. Tighten the nuts fully.
5. Cut off the excess bar length.
6. Place an approved grout in the recessed area provided for the bar's nut and washer.

D. Concrete Finish

Use the Type III—Special Surface Coating Finish on PSC bridge members according to Subsection 500.3.05.AB and as follows:

- Beams -- Outside faces of certain exterior beams as indicated on the table of "Bridge Areas Bridge Areas Requiring a Type III Finish", in Subsection 500.3.05.AB.

- Deck Units -- Traffic and top faces of curbs on exterior units and the outside faces of certain exterior beams as specified in the table of “Bridge Areas Requiring a Type III Finish”, in Subsection 500.3.05.AB..

507.3.06 Quality Acceptance

General Provisions 101 through 150.

507.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

507.4 Measurement

A. Prestressed Concrete Piling

Prestressed concrete piling shall be furnished, driven, and measured as a Pay Item under Section 520.

B. Beams

Accepted PSC beams will be measured in linear feet (meters) of each different type designation of beam.

Linear measurements will be the nominal lengths shown on the Plans.

Beam type designations will be shown on the Plans and will be related to any of the following:

- Cross sectional area and prestress tendons
- AASHTO type
- Special design

C. Deck Units

Accepted PSC deck units (such as flat slabs and double tees) will be measured for payment per span of each different nominal span length.

D. Caps

Accepted PSC caps will be measured for payment per each cap.

E. Prestressed Concrete Box Beams

PSC box beams will be measured for payment by the linear foot (meter) of beam of each vertical depth and by the number of strands in the beam.

507.4.01 Limits

No separate measurement will be made for any of the following:

- Painting, rubbing, anchor, and bearing components, as well as diaphragm bar assemblies on accepted PSC beams
- Individual deck units on which curb sections are located
- Material used in anchor components, shear key pours, and construction expansion joints
- Drifting components, anchor components, and asphalt-saturated felt for PSC caps
- Grouting between PSC box beams
- Furnishing and installation of diaphragm bar assemblies and anchor and bearing components

507.5 Payment

Payment will be made under:

Section 507-Prestressed Concrete Bridge Members

Item No. 507	PSC Beam (<u>Type</u>)	Per linear foot (meter)
Item No. 507	Box Beam (Depth/Strands)	Per linear foot (meter)
Item No. 507	PSC Deck Units_____ foot (meter) span	Per span
Item No. 507	PSC Caps	Per each

A. Beams

The quantity of beams, determined as provided in Subsection 507.4, “Measurement”, will be paid for at the Contract Price per linear foot (meter) of each different type designation, complete in place.

B. PSC Box Beams

The quantity of PSC box beams will be paid for at the Contract Unit Price bid per linear foot (meter). Payment shall be full compensation for furnishing and erecting the beam.

C. Deck Units

The quantity of deck units will be paid for at the Contract Price per span of each different nominal span length, complete in place.

D. Caps

The quantity of caps will be paid for at the Contract Price per each, complete in place.

E. Partial Payments

Material allowance payments for bridge beams will be determined and paid for according to the requirements of Subsection 109.07, “Partial Payments.”

507.5.01 Adjustments

Upon completion of the erection in its final manner and position, 95 percent of the Contract Price will be paid on the next statement.

If there is no field rubbing or painting required, the 95 percent may be increased to 100 percent of the Contract Price. If this work is required, the remaining 5 percent will be included on the next statement after the Contractor satisfactorily completes the work.

Section 508—Asphalt Plank Bridge Floor

508.1 General Description

This work consists of laying asphalt plank slabs as a wearing surface on a prepared bridge deck.

508.1.01 Definitions

General Provisions 101 through 150.

508.1.02 Related References

A. Standard Specifications

Section 530—Waterproofing Fabrics

B. Referenced Documents

General Provisions 101 through 150.

508.1.03 Submittals

General Provisions 101 through 150.

508.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Premolded Asphalt Plank	825.2.01
Cutback Asphalt	821.2.01
Asphalt Cement	820.2.01

508.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

508.3 Construction Requirements

508.3.01 Personnel

General Provisions 101 through 150.

508.3.02 Equipment

General Provisions 101 through 150.

508.3.03 Preparation

General Provisions 101 through 150.

508.3.04 Fabrication

General Provisions 101 through 150.

508.3.05 Construction

Construct the wearing surface of asphalt plank on a concrete base, timber base, or waterproofed base as follows:

A. Concrete Base

When laying the plank on a concrete base, construct the plank floor as follows:

1. Ensure that the concrete is dry and free from dust and rubbish.
2. Remove surplus talc and other powder from the base.
3. Apply approximately 1 gal (1 L) of cold cutback asphalt to each 100 ft² (9 m²) of surface.
4. Brush the cutback asphalt coat out well and allow it to dry.
5. Mop the surface with approximately 50 lbs (22 kg) of hot-applied asphalt cement for each 100 ft² (9 m²) of surface. Imbed the plank in the cement as follows:
 - a. Mop and lay the plank simultaneously before the cement cools.
 - b. Lay the plank straight and smooth with staggered joints. Ensure that the plank is free of irregularities.
 - c. Crowd each plank snugly against adjacent planks so that seams and spaces between planks are completely filled with asphalt cement.

B. Timber Base

When laying the plank on a timber base, construct the plank floor as follows:

1. Securely spike the wooden floor upon which plank will be laid.
2. Ensure that the surfaces of adjacent planks do not vary by more than 1/8 in (3 mm).
3. Remove nails, dirt, rubbish, etc. before laying the asphalt plank.
4. Lay the plank the same as for a concrete base (see Subsection 508.3.05.A, “Concrete Base”).

C. Waterproofed Base

When laying the plank on a waterproofed base (see Section 530), lay the plank with the final mop of hot asphalt or tar described in Subsection 508.3.05.A.5.

1. Mop the surface and lay the plank simultaneously before the asphalt or tar cools.
2. Lay the plank as specified in Subsection 508.3.05.A.5 steps b and c.

508.3.06 Quality Acceptance

General Provisions 101 through 150.

508.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

508.4 Measurement

The Work is measured for payment in square yards (meters) of accepted plank:

- The length calculated is measured along the surface.
- The width calculated is the width of surface laid.

508.4.01 Limits

General Provisions 101 through 150.

508.5 Payment

This work will be paid for at the Contract Price per square yard (meter) for asphalt plank bridge floor complete in place.

Payment will be made under:

Item No. 508	Asphalt plank bridge floor _____ in (mm) thickness	Per square yard (meter)
--------------	--	-------------------------

508.5.01 Adjustments

General Provisions 101 through 150.

Section 509—Prestressing Concrete by Post Tensioning

509.1 General Description

This work consists of prestressing concrete by post-tensioning cast-in-place concrete. The work includes furnishing, placing, and tensioning prestressing steel according to the Plan details and these Specifications.

509.1.01 Definitions

Working Force and Working Stress: The force and stress remaining in the prestressing steel after the following losses:

- Creep and shrinkage of concrete
- Elastic compression of concrete
- Creep of steel
- Loss in post-tensioned prestressing steel from the sequence of stressing

- Friction and anchor set (see Subsection 509.3.05.J, “Post-Tension the Tendons,” steps 18 to 19)
- Other losses peculiar to the method, technique, or system of prestressing (see Subsection 509.3.05.J, “Post-Tension the Tendons,” step 21)

509.1.02 Related References

A. Standard Specifications

B. Referenced Documents

AASHTO Specifications for Highway Bridge, Article 9.16.1

AASHTO Specifications for Highway Bridge, Article 9.16.2

ASTM C 109

ASTM A 416

ASTM A 722

ASTM C 939

509.1.03 Submittals

A. Coupler Use and Location

The use and location of couplers in bars entering into the prestressing work is subject to the Engineer’s approval.

B. Alternate Stressing or Anchorage Block Drawings and Calculations

When using stressing or anchorage blocks not shown on the Plans, submit shop drawings and calculations for the blocks to Bridge and Structural Design when submitting the prestressing system calculations and shop drawings.

C. Design Calculations

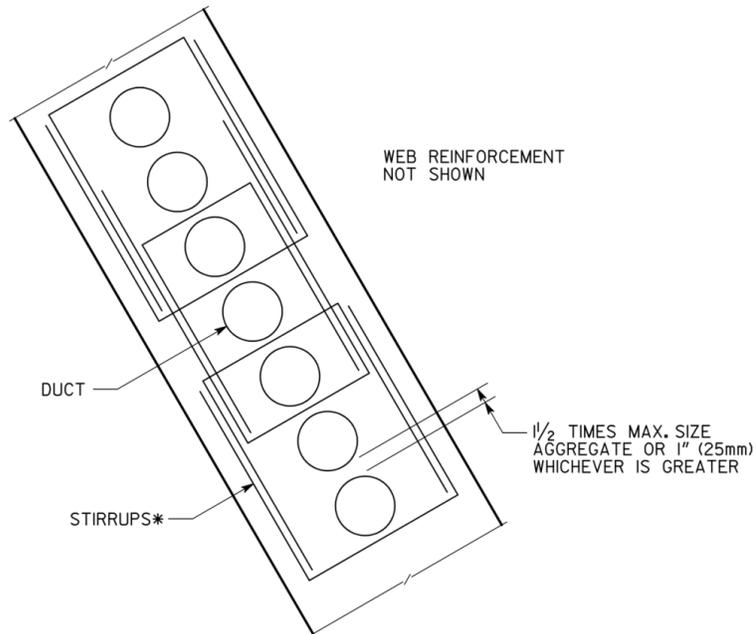

Submit design calculations for the proposed post-tensioning system to Bridge and Structural Design for Department review and approval. Design calculations may be on letter size sheets.

Submit calculations for the size and spacing of the reinforcing around the ducts, as shown in Figure 1, to Bridge and Structural Design. Include the following in the calculations:

- Required jacking force and elongation of tendons during tensioning
Using the initial jacking force, design the reinforcing to prevent ducts from pulling out because of the effects of web curvature and slope.
- Stresses in anchorages and distribution plates
Ensure that the calculations account for reinforcing to prevent the peeling of anchorages from the top and bottom slab. See Figure 2 for minimum reinforcing requirements for tying ducts to the deck reinforcing.
- Stress-strain curves typical of the prestressing steel to be furnished
- Seating losses
- Temporary overstresses
- Reinforcing in the concrete to resist tensioning loads

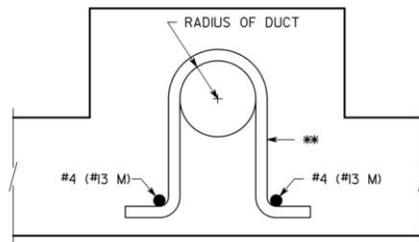

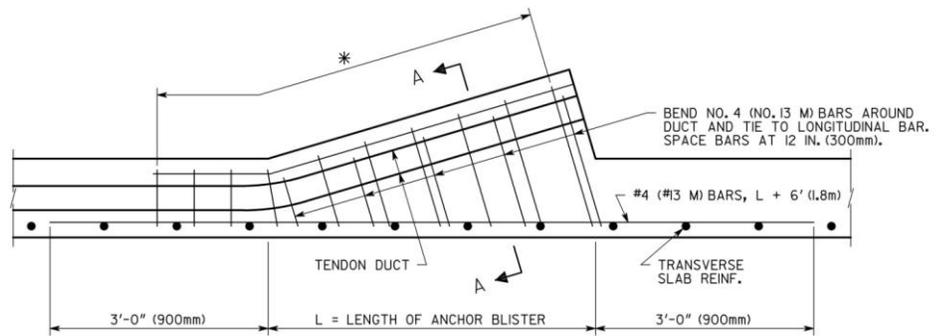

Determine bearing offsets and expansion joint gaps and adjust for construction sequence, prestress shortening, and temperature.

Section 509-Prestressing Concrete by Post Tensioning

- * A STIRRUP GROUP IS ONE PAIR OF OVERLAPPING "U" SHAPED BARS.
- STIRRUPS SHALL ENCLOSE VERTICAL WEB REINFORCEMENT.
- NO MORE THAN 3 DUCTS SHALL BE ENCLOSED BY A STIRRUP GROUP.
- MINIMUM BAR SIZE: NO. 4 (NO. 13M) BAR.
- MAXIMUM LONGITUDINAL BAR SPACING: 24 IN. (600mm).

Figure 1

- * ALL NECESSARY REINFORCING MAY NOT BE SHOWN.
 - ** BEND #4 (#13 M) BARS AS CLOSELY AS POSSIBLE TO RADIUS OF DUCT. TIE DUCT TO BARS.
- NOTE: #4 (#13 M) LONGITUDINAL BARS AND #4 (#13 M) BARS AROUND DUCT ARE NOT INCLUDED IN REINFORCING BAR SCHEDULE. INCLUDE COST OF BARS IN COST OF THE REINFORCING STEEL.
- NOTE: TOP SLAB BLISTER SIMILAR. SEE PLANS FOR ADDITIONAL DETAILS.

Figure 2

D. Certificates of Compliance

The Department will accept certificates of compliance for cements to be used. The Department reserves the right, however, to sample and test the cement before its use and at any time during the progress of the work.

E. Certified Mill Test Reports

Submit certified mill test reports for high tensile prestressing steel to the Project Engineer.

F. Shop Drawings

Submit Shop Drawings for review and approval according to Subsection 501.1.03.B, "Shop Drawings." Place a title block in the lower right-hand corner of the drawings that includes the following:

- Project number
- Sheet numbering for the Shop Drawings
- Structure name
- Contractor and fabricator names

Submit Shop Drawings on 23 in by 36 in (575 mm by 900 mm) sheets with a 1-1/2 in (38 mm) left margin and a 1/2 in (13 mm) top, bottom, and right margins.

The Shop Drawings shall include the following:

1. Fully dimensional views showing all projections, recesses, notches, openings, blockouts, and pertinent design details
2. Details of mild steel reinforcing showing size, spacing, and location, including special reinforcing required as determined by the design calculations but not shown on the Plans
3. Details of ducts for post-tensioning tendons showing size, type, and horizontal and vertical profiles
4. Details of duct supports, grout tubes, and vents showing size, type, and location
5. Details of the relative positions of reinforcing steel, ducts, and anchorages
6. Details of the anchorage systems for the proposed post-tensioning system
7. A table giving jacking sequence, jacking forces, and initial elongation of the tendons at each erection stage for post-tensioning
8. Details and a complete description of the post-tensioning system to be used for permanent tendons
9. Details of the prestressing, including:
 - Method, sequence, and procedure for prestressing and securing tendons
 - Procedure for releasing tendons
 - Equipment supplier and type
 - Tendon size and properties
 - Anchorage plates and assemblies
10. Information on grouting, including:
 - Grout mix design
 - Method of mixing and placing the grout
 - Type and capacity of grouting equipment
11. Working drawings and bar schedules for each prestressing system
12. Details of reinforcing or coil ties under anchorage plates
13. Details for usage of high-strength steel bar (furnished by the bar manufacturer)
14. Friction factors used in the prestressing system of deformed bars

Section 509-Prestressing Concrete by Post Tensioning

As an option, shop drawings may be submitted on plan sheet sizes of 12" x 18" (305 mm x 457 mm) or 11" x 17" (279 mm x 432 mm) for review and approval. Information contained on these sheets must be legible.

After shop drawings have been approved, submit an electronic file that is compatible with Bentley Microstation J (Version 7) Cadd operating system, or an electronic file in Adobe Acrobat Portable Document Format (.pdf) to the Engineer. For bridges carrying railroads only, after shop drawings have been approved, submit one full size set of reproducible drawings to the Department.

G. Ram Calibration Charts

Before using rams in the work, furnish the Engineer with a certified chart from the calibration for each ram.

H. Designs and Details of Distribution Reinforcing Steel

The Department plans for anchorages show only a minimum amount of distribution reinforcing steel.

Design and detail the reinforcement needed to prevent bursting, peeling, and splitting. Submit the designs and details to the Engineer for review and approval.

I. Gauge Readings and Elongations

Keep a record of gauge pressures or readings and elongations at the end of each jacking operation and submit it to the Engineer for review and approval.

509.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Steel Wire Strand	853
Structural Steel for Anchorage Devices, Distribution Plates, and Incidental Parts Required to Be of Steel	501
Grout	509.3.02.C
Cement	830
Admixtures	831
Water	880

Do not use strands from more than one source within the same tensioning operation.

Strands that differ in size from ASTM A 416 are to be submitted for prior approval.

High strength steel bars shall meet ASTM A 722 Type II, and S1 through S3 supplemental requirements and have manufacturers details for their use.

Ensure all bars within any member are of same grade.

Bar couplers and locations are to be approved prior to use and shall have tensile strength not less than manufacturers minimum for strength of bar.

Allow the Department 60 calendar days before installing prestressing steel to test the steel and approve the materials furnished.

Use the anchor devices and distribution plates recommended by the manufacturer of the prestressing system.

Have the Engineer approve grout for filling recesses or encasing anchoring devices. Use a type recommended by the manufacturer for highly stressed steel.

509.2.01 Delivery, Storage, and Handling

A. Protect Prestressing Steel

Protect prestressing steel against physical damage, rust, and corrosion..

Reject all damaged, rusted, or corroded prestressing steel. See Subsection 509.3.06, "Quality Acceptance."

B. Package Prestressing Steel

Package prestressing wire or strand in containers or shipping forms to protect steel from physical damage and corrosion during shipping and storage. Comply with these packaging requirements:

1. Place a corrosion inhibitor to protect against rust and corrosion as follows:

- a. Place the inhibitor in the package or form.
- b. Incorporate the inhibitor in a carrier-type packaging material.
- c. Apply the inhibitor directly to the steel.

Ensure that the corrosion inhibitor does not damage the steel, grout, or bond strength of the steel to the grout.

2. Immediately replace or restore to original condition damaged packaging or forms.

3. Clearly mark the shipping package or form with the following:

- A statement that the package contains high-strength prestressing steel
- Handling instructions
- The type, kind, and amount, of corrosion inhibitor used, including the date placed, safety orders, and instructions for use

C. Ducts

1. Place all prestressing steel tendons in openings or ducts.

2. Unless otherwise approved by the Engineer, use only rigid, galvanized, ferrous metal that is mortar tight for all longitudinal prestressing steel ducts.

3. Fabricate the ducts with an inside area that is at least double the effective area of the prestressing steel in the duct.

- a. Fabricate ducts that encase single high-strength prestressing steel bars with an inside diameter at least 3/8 in. (10 mm) larger than the diameter of the bar to be used.
- b. Use a minimum wall thickness of 0.030 in (0.75 mm).

4. Rigid ducts may be fabricated with either welded or interlocked seams. There is no need to galvanize the welded seam or the transition couplings that connect the ducts to anchoring devices.

5. Weld transition couplings to the anchor plate.

6. Pre-bend all ducts that must be curved to match the roadway alignment and/or tendon profile. Shape the ducts without crimping or flattening them.

509.3 Construction Requirements

509.3.01 Personnel

A. Representative of the Post-Tensioning System Supplier

If the Engineer requires, provide a representative of the post-tensioning system supplier at no additional cost to the Department.

Provide a representative who:

- Is skilled in using post-tensioning systems
- Supervises or provides surveillance of the work
- Provides information about the post-tensioning system to the Engineer as needed

509.3.02 Equipment

A. Prestressing Equipment

Provide the following equipment for construction and prestressing:

1. Tensioning Jacks

Use tensioning jacks equipped with the following:

- Long enough stroke to perform stressing in a minimum number of strokes
- Provide a positive means of marking each elongation increment where two or more strokes are required
- Ports or windows to exam and measure tendon movement
- Slow stress release capability to allow the jack to relax from overstress to the proper seating force

2. Tensioning Equipment

Use tension prestressing tendons equipped with the following:

- Equipment that allows direct elongation measurement
- Hydraulic ram that determines the tensioning force applied

Measure the tensioning force applied by the ram using either of the following gauges:

- a. Gauge that measures either the internal hydraulic pressure in the ram or the force exerted by the ram
- b. Spring-type dynamometer used with the tensioning force applied directly

Convert the readings from either of these gauges to actual tensioning forces using calibrated values from a calibration chart.

Use gauges with a diameter of at least 6 in (150 mm) that allow accurate readings of load increments of one percent of the total capacity of the ram used, not to exceed two percent of the tensioning force used.

3. Load Cell

Ensure that the range of the load cell does not use the lower 10 percent of the manufacturer's rated capacity to determine the jacking stress.

B. Sampling and Inspecting Prestressing Steel

The Department will identify, sample, test, and approve all prestressing steel as follows:

1. Identification

- a. Assign a lot number to all strand and all bars of each size from each mill heat shipped to the jobsite.
- b. Tag the lots so that each such lot can be positively identified at the job site.
- c. Assign and tag each lot of anchorage assemblies and bar couplers.
- d. The Engineer or Department inspector will reject all unidentified prestressing steel, couplers, or anchorage assemblies received at the site, and any items without positive identification.

2. Sampling

- a. Give to the Engineer samples from each size and each heat of prestressing bars and prestressing steel strand, and from each lot of anchorage assemblies and bar couplers.
- b. Submit with each sample of prestressing strand or bar the manufacturer's certification stating the minimum guaranteed ultimate tensile strength of the sample furnished.

Section 509-Prestressing Concrete by Post Tensioning

- c. Submit enough samples to make up two assembled test units from each heat, complete with end fittings and anchoring devices. Test units shall be at least 8 ft. (2.4 m) long.
 - d. If the Engineer's tests indicate the necessity of retests, submit twice the number of previous specimens without cost to the Department. Identify the samples by heat number.
 - e. Submit samples to the Engineer in ample time to allow for testing, tabulating results, and, in case of unsatisfactory findings, to call for and test substitute samples.
 - f. The Department will not pay the Contractor additional compensation because of the delay while waiting for approval of the material furnished for testing.
3. Tendon Modulus of Elasticity
- a. Submit to the Engineer for approval the apparatus and test methods you propose to use to determine the modulus of elasticity.
 - b. Run bench tests on two samples of each size and type of longitudinal strand and/or wire tendon prior to stressing the initial tendon.
 - c. Stress the tendon at an anchor assembly with the dead end consisting of a load cell.
 - d. Apply 80 percent of the ultimate tension to the test specimen in 10 increments and record the gage pressure, elongation and load cell force for each increment..
 - e. Detension the test specimens back to 0 in 10 increments, and record the gage pressure, elongation, and load cell force for each increment.
 - f. Submit the test data to the Engineer.
 - g. Re-evaluate and correct, as necessary, the theoretical elongations shown on the post-tensioning working drawings based on the results of the tests.
 - h. Submit any revisions to the theoretical elongations to the Engineer.
 - i. After the initial testing, the Engineer may require five more tests. Space these tests evenly throughout the duration of the contract.
4. In-Place Friction Test
- a. Submit to the Engineer for approval the apparatus and test methods you propose to use to measure the in-place friction.
 - b. After receiving approval for the apparatus and method, test the first draped continuity strand and/or wire tendon in place of each size and type.
 - c. Apply 80 percent of the ultimate tension to the test specimen in 10 increments and record gage pressure elongation and load cell force for each increment.
 - d. Detension the tendon back to 0 in 10 increments, and record the gage pressure, elongation, and load cell force for each increment.

NOTE: You only need to run one friction test for each type and size of a tendon for the Project.

- e. Submit the results of the tests (loss due to friction and modulus of elasticity) to the Engineer.

C. Grouting Equipment

Use grouting equipment capable of the following:

- Continuously grouting the largest tendon on the Project in 20 minutes or less
- Pumping the mixed grout according to the requirements of this Specification

Provide the following grouting equipment:

- Mixer capable of continuous mechanical mixing and of producing a grout that is free of lumps and undispersed cement
- Accessory equipment that provides accurate solid and liquid measures to batch materials
- Positive displacement pump able to produce an outlet pressure of at least 150 psi (1 MPa) gauge
- Pump seals that do the following:
 - Keep oil, air, or other foreign substance out of the grout
 - Prevent loss of grout or water
- Pressure gauge with a maximum full scale reading of 300 psi (2 MPa) installed at some point in the grout line between the pump outlet and the duct inlet to establish grout pressure at the pump
- Standby flushing equipment capable of pumping at 300 psi (2 MPa) gauge and flushing out partially-grouted ducts
- A different power source for the flushing equipment than the grouting equipment
- Screen with 0.125 in (3 mm) maximum clear openings to screen the grout before it is introduced into the grout pump
- Hopper placed directly over the pump inlet
 - Attach the hopper to the pump inlet using a gravity feed.
 - Keep the hopper at least partially full of grout during the pumping operation to prevent air from being drawn into the post-tensioning duct.

D. Rams

Twenty days before using rams and their gauges or reading devices in the work, have them calibrated by an approved laboratory.

Recalibrate the equipment every three months during the work or when the Engineer observes erratic results. For each calibration, furnish a calibration chart, certified by the laboratory, to the Engineer.

The Engineer may extend the 3-month interval if there are no performance changes. However, recalibrate at least every 6 months.

509.3.03 Preparation

A. Test Tendon Modulus of Elasticity

To determine the tendon elongations while stressing, bench test two samples of each size and type of longitudinal strand and/or wire tendon using the following procedure:

1. Propose apparatus and methods used to perform these tests for approval by the Engineer.
2. Stress the tendon at an anchor assembly with the dead end consisting of a load cell.
3. Tension the specimen to 80% of ultimate in 10 increments.
4. Detension the specimen from 80% of ultimate to 0% in 10 increments.
5. Record the gage pressure, elongation, and load cell force for each increment. Provide this data for the Engineer.
6. Reevaluate the theoretical elongations shown on the post-tensioning working drawings using the results of the tests. Correct the results as necessary.
7. Submit revisions to the Engineer for approval.
8. Perform five more tests after the initial testing (if required by the Engineer). Space these tests evenly throughout the duration of the contract.

B. Test Friction

To accurately determine the friction loss in a strand and/or wire tendon, test, in place, the first draped continuity tendon of each size and type using the same procedure described for the modulus of elasticity test. Only one friction test for each type and size of a tendon is required for the project. Submit the results of the tests to the Engineer.

C. Test Anchorages

Before construction, test prestressing anchorage blocks of the type indicated in Figure 2 using the proposed jacking system as follows:

1. Construct and test anchorage test blocks for the following:
 - Each different radius of bend of the duct into the anchorage
 - Each different number of strands per duct arrangement
2. If anchorages (reinforcing, anchorage geometry, anchor plate, and duct bend radius) are the same within a Project or bridge, test only the anchorage with the largest jacking force.
3. Assemble a test block with these features:
 - Same concrete dimensions of the structure cross section at the points of anchorage in the proposed system
 - Tendon geometries, anchor plates, and anchorage reinforcing steel proposed for use in the structure
4. Place the tendons.
5. Stress the tendons to the full force required by the design using the proposed jacking system and stressing procedures.

Anchorages are acceptable to the Department if no concrete cracks wider than 1/100 in (0.25 mm) develop within 3 days under full force.

509.3.04 Fabrication

General Provisions 101 through 150.

509.3.05 Construction

A. Contractor Options

The Contractor may choose from these options when constructing the structure according to the Department plans:

1. Alternative Prestressing Systems

The Contractor may use post-tensioning systems other than those shown on the Plans. The alternative system may use wires, bars, or strands anchored with friction grips or bearings.

Unless the Plans allow, do not use prestressing systems that incorporate dead-end anchorages.

Choose alternative systems that can be stressed from either end unless the construction staging does not allow room to stress tendons from both ends. In this case, use anchorage systems with compression plates or fittings to seat anchor wedges.

2. Alternative Stressing or Anchorage Blocks

Stressing or anchorage blocks for the structure may deviate from those shown on the Plans.

Alternate stressing or anchorage blocks must be located inside the box. Place the blocks in any of the following locations:

- At the juncture of the bottom of the top slab
- At the juncture of the top of the bottom slab and the web walls
- Within fillet areas in reinforced stressing blocks
- In partial depth diaphragms

Permanent or temporary stressing blockouts are allowed in the top of the top slab when post-tensioning ducts do not have a moisture-retaining low point.

B. Install the Ducts

Install ducts for prestressing steel as follows:

1. Support ducts at intervals of no more than 2 ft (600 mm).
The horizontal tolerance for longitudinal ducts in the top or bottom slab is plus or minus 1 in (25 mm). The vertical tolerance for longitudinal ducts is plus or minus 1/4 in (6 mm).
2. Join rigid duct sections using positive metallic connections. Connect the sections carefully to prevent misaligning the ducts at the joints.
3. Use waterproof tape at the connections.
4. Make duct splices so that the nose of the tendon being pushed into the duct goes from a male end into a female end. This prevents tendons from catching on a duct end.
5. Stagger splices in ducts to prevent splices in the same location in a row of ducts. Stagger the splices to give a 3 ft (900 mm) longitudinal spacing from row to row.
6. Carefully cut and deburr the ends of ducts.
7. Use ducts or anchorage assemblies with pipes or other connections as grout ports for injecting grout after the prestressing. Ports are required at each tendon anchorage.
8. Place continuous-draped longitudinal ducts in the web in one vertical row at the center of the web.
9. Tie the ducts securely to the saddles, which shall hold the duct in position during concrete placement and hardening.
10. Ensure that the clear distance between the ducts is 1-1/2 times the maximum size aggregate in the concrete mix or 1 in (25 mm) whichever is greater.
11. Do not bundle ducts.
12. See Figure 3 below for an illustration of how to tie duct support saddles.
13. If needed, place ducts in the top or bottom slab in one of these ways:
 - Horizontally at the variable spacings
 - In closely and uniformly spaced groupsThe minimum horizontal clear spacing between ducts must be 3 in (75 mm).
14. Install at least one more continuity duct than needed in each web throughout the length of the structure. This duct will be used during blockage and excessive prestress losses during construction.
15. Position the ends of the additional ducts to use anchorage blocks if necessary.
16. Vent continuity ducts over each intermediate support.
Provide vents with a diameter of at least 1/2 in (13 mm) and made of either steel or polyethylene.
17. Provide vents at the low point of every duct to drain off water in the duct.
18. Connect vents to ducts using approved metallic structural fasteners.
19. Ensure that the vents are:
 - Mortar tight
 - Taped as necessary
 - Sealable
 - Capable of allowing grout to be injected through them
20. Immediately before installing the prestressing steel, demonstrate to the Engineer that ducts are unobstructed and free of water and debris.

Section 509-Prestressing Concrete by Post Tensioning

21. After installing ducts in the forms, keep the duct ends sealed to keep out water and debris.
22. After post-tensioning the steel, fill ducts with or without strands full of grout.
23. After the grout has set, remove the ends of the vents flush with the concrete surface.

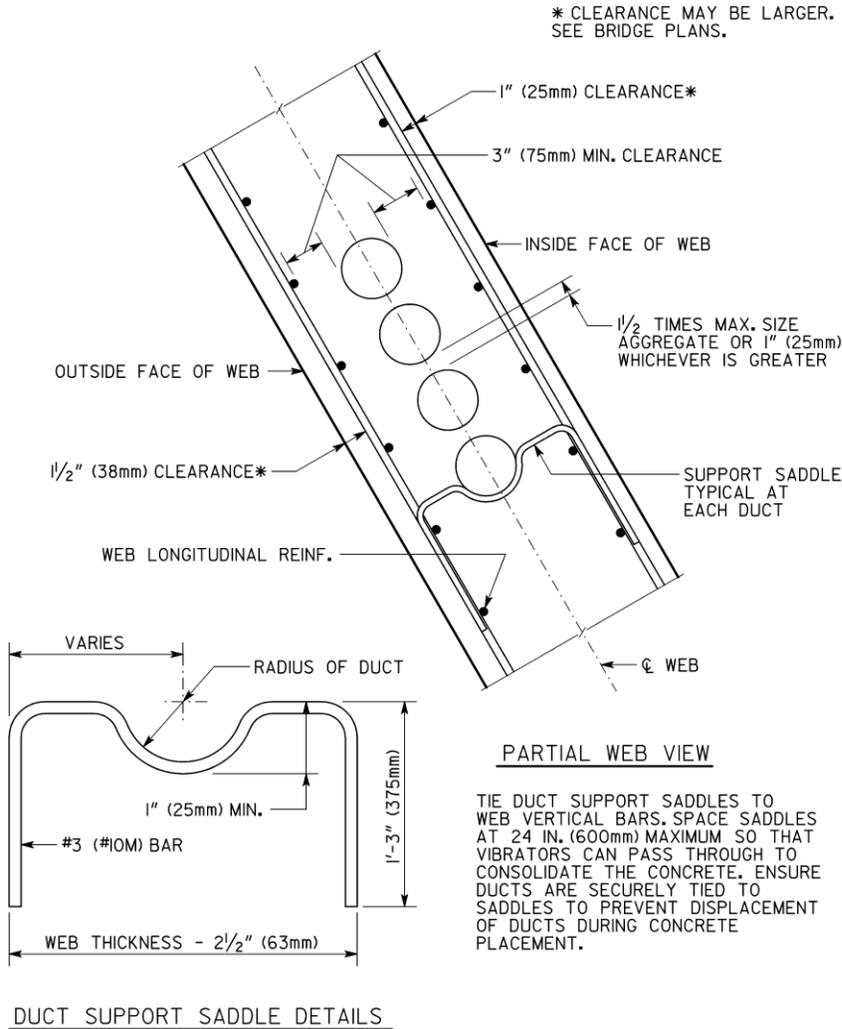

Figure 3: Partial Web View

C. Install Reinforcing Steel

Fabricate reinforcing steel and place it according to the Plans and Shop Drawings.

Do not cut and remove reinforcing steel to align stressing ducts properly. Replace bars that cannot be fabricated to clear the ducts with bars with an adequate lap length.

Where bars are extended by the use of couplers, the assembled units shall have a tensile strength of not less than the manufacturer's minimum guaranteed ultimate tensile strength of the bar.

Submit revised drawings indicating the proposed bar to the Engineer for review and approval.

D. Install Anchorages

Secure post-tensioned prestressing steel at the ends using permanent anchoring devices recommended by the prestressing steel manufacturer and meeting the requirements herein..

Use anchoring devices that hold the prestressing steel at a load producing a stress of at least 95 percent of the guaranteed minimum tensile strength of the prestressing steel.

E. Install Distribution Devices

Distribute the load from the anchoring device to the concrete using devices that conform to the following:

- The final unit compressive stress on the concrete directly underneath the plate or assembly does not exceed 3,000 psi (20 MPa) or 0.9 (f'_{ci}), whichever is less.
- Bending stresses in the plates or assemblies induced by the pull of the prestressing steel do not exceed the yield point of the material or distort the anchorage plate as determined by the Engineer when 100 percent of the load is applied.

The Contractor may omit steel distribution plates or assemblies when furnishing large anchoring devices used with a steel grill embedded in concrete to distribute the compressive stresses to the concrete.

Install distribution devices as follows:

1. Place steel distribution plates, if used, inside the end surface of the member.
2. Recess anchoring devices so that the ends of the prestressing steel and all of the anchoring devices are embedded in concrete.
3. After post-tensioning and grouting the duct, clean foreign and loose material off the surfaces of the concrete.
Do not clean the concrete until the duct grouting operations are complete.
4. Fill anchoring device recesses with an approved, non-shrink grout.
5. Cover the anchoring devices and ends of the prestressing steel with at least 2 in (50 mm) of grout, unless the Plans specify more.

F. Have the Engineer Inspect

Have the Engineer inspect and approve the placement of reinforcement, ducts, and anchorages before pouring concrete into the forms.

G. Pour the Concrete

Pour concrete according to Section 500.

H. Install the Tendons

Install tendons in the ducts after pouring the top deck or when the Engineer approves.

Before installing the tendons, demonstrate to the Engineer that the ducts are unobstructed and free of water.

Install the tendon in the duct as approved by the Engineer.

I. Follow Weld Restrictions

The Engineer will not allow welds or welding equipment grounds on the forms or near the prestressing steel after the steel has been installed.

J. Post-Tension the Tendons

Post-tension the tendons as follows:

Section 509-Prestressing Concrete by Post Tensioning

1. Before post-tensioning tendons, ensure that the deck slab thickness and deck reinforcement cover comply with the Plan requirements.
2. Unless otherwise noted on the Plans or approved by the Engineer, wait to prestress cast-in-place concrete until the compressive strength of all the concrete placed reaches the required 28-day strength and the concrete is at least 14 days old.

If the Engineer approves, the Contractor may apply a portion of the prestressing force to a member with a concrete strength less than the value shown on the Plans.

Even with this partial prestressing, the Contractor must successfully construct the members.
3. Conduct the tensioning process so that the applied tension and the elongation can be measured.
4. Tension the prestressing steel using hydraulic jacks.
5. Tension the prestressing tendons in continuous post-tensioned members by jacking at each end of the tendon. Jacking of both ends does not need to be done simultaneously.
6. When approved by the Engineer and if shown on the Plans, tension bent cap tendons by jacking from one end only.
7. Tension the prestressing tendons in simple span post-tensioned members by jacking from one end only.
8. When tensioning from one end of the tendon only, tension half of the prestressing steel in each member from one end and the other half from the opposite end of the span unless otherwise shown on the Plans.
9. Unless allowed on the Plans, do not use prestressing systems that incorporate dead-end anchorages.
10. Where construction staging does not allow room to stress tendons from both sides, use anchorage systems with compression plates or fittings to seat anchor wedges.
11. Ensure that the prestressing steel force does not drop below the value shown on the Plans.
12. Ensure that the tendon force measured by gauge pressure is within 5 percent of the force calculated by elongation movement.
13. If the measured elongation at the jacking stress varies more than 5 percent from the theoretical elongation, or if the unbalanced force about the section center line exceeds 3 percent:
 - a. Check the entire operation and determine the error.
 - b. Correct the error to the Engineer's satisfaction before proceeding with the work.
14. Do not allow the total force at each section to drop below the total prestressing force specified. However, the prestressing force may vary plus or minus 5 percent per tendon.
15. Unless otherwise specified on the Plans, ensure that the average working stress in the prestressing steel does not exceed 80 percent of the yield point stress of the prestressing steel.
16. To determine the amount of steel required, ensure that the maximum temporary tensile (jacking) stress in prestressing steel does not exceed 80 percent of its specified minimum ultimate tensile strength unless the Plans indicate a lower jacking stress.
17. Anchor the prestressing steel at stresses (initial stress) that will retain working forces at or higher than the minimum values shown on the Plans or approved by the Engineer.

Do not allow the initial stress to exceed 70 percent of the specified minimum ultimate tensile strength of the prestressing steel.
18. Check that the loss of elongation from anchor set agrees with the anticipated value used in the stress calculations.
 - a. Adjust measured Elongation to account for the actual measured anchor set.
 - b. Maintain 5 percent agreement between the elongation and the stressing force.

19. To compute the prestress losses from friction, use the formula in the AASHTO Specifications for Highway Bridge, Article 9.16.1. The total friction losses at any section will be the sum of the effects for each tendon, depending on its anchorage location for each tendon.
20. To compute other prestress losses, use the AASHTO Specifications for Highway Bridge, Article 9.16.2.
21. After stressing and anchoring tendons and after the Engineer approves, trim projecting tendons by sawing as shown in the approved working drawings.

K. Mix the Grout

Grout for Prestressing Concrete Bridge Members: Grout for use with prestressing concrete bridge members includes a mixture of Portland cement, water, and an approved expansive admixture, as follows:

- Water—Use potable water or other water that meets the requirements of Subsection 880.2.01.
- Portland cement—Use Portland cement that meets the requirements of Subsection 830.2.01. Standard usage is Type II Portland cement, but the Engineer may allow Type I or III. The Engineer may require Type III for cold weather grouting.

Submit to the Department certificates of compliance for the cements used. However, the Department reserves the right to sample and test the cement before its use and at any time during the work.

- Admixture—Use admixtures that meets the requirements of Subsection 831.2.02.A.

NOTE: Do not use sand in grout used for prestressing concrete bridge members.

1. Before grouting, select the material proportions based on the following:
 - Tests made on the grout
 - Documented experience with similar materials, equipment, and field conditions (weather, temperature, etc.).
2. Select admixtures used in Grout for Prestressing Concrete Members. If used and approved by the Engineer, use admixtures that demonstrates low water content, good flowability, and minimum bleed.

You may use the following:

- Either liquid or solid admixtures
- Enough fine, aluminum powder to obtain 5 to 10 percent unrestrained expansion of the grout

Do not use the following:

- Thixotropic additives without prior approval from the Engineer
 - Admixtures that have ingredients corrosive to steel or chemicals in quantities that may have a harmful effect on cement
 - Admixtures with chloride ions in excess of 0.50 percent by weight of the admixture (assuming 1 lb (0.45 kg) of admixture per 94 lbs (42.6 kg) each of cement), fluorides, sulphites, and nitrates
- a. At least 30 days before using the admixture, submit to the Engineer at least 2 1/2 lbs (1 kg) of a proposed dry-type admixture, or 1 quart (1 L) of a proposed liquid-type admixture.
 - b. Send with the sample a description of the content, recommended proportions to be used, and the manner and sequence of adding to the mix.
3. Ensure that the water content is the minimum necessary for proper placement and does not exceed a water-cement ratio of 0.45 (approximately 5 gal (19 L) of water per bag of cement).
 4. Add the grout components to the mixer in the order listed or as required by the admixture manufacturer and mix the dry materials in a mixer or clean, tight box until the mixture is a uniform consistency:
 - Water
 - Portland cement

- Admixture
- 5. Mix the grout long enough to thoroughly blend it without excessively increasing the temperature or losing admixture expansion properties.
- 6. Agitate the grout continuously until it is pumped.
- 7. Do not add water to increase grout flowability that has decreased because grout use is delayed.

The Engineer may determine grout pumpability according to the ASTM C 939. When using this method, efflux time for the grout sample immediately after mixing must be at least 11 seconds.

L. Prepare Ducts for Grouting

Prepare the ducts for grouting by flushing the metal ducts as determined by the Engineer.

1. Use water to flush ducts that contains at least 0.1 lb/gal (10 g/L) of slaked lime (calcium hydroxide) or quicklime (calcium oxide).
2. Use oil-free compressed air to blow out ducts.

M. Grout the Duct

Bond prestressing steel to the concrete by filling the space between the duct and the tendon with grout.

Grout the duct as follows:

1. Open the grout and vent openings.
2. Ensure that the pumping pressure at the tendon inlet does not exceed 250 psi (2 MPa) gauge.
3. Allow grout to flow from the first vent after the inlet pipe to remove residual flushing water or entrapped air.
4. Once water or air is removed, cap or otherwise close the vent. Close the remaining vents in sequence in the same manner.
5. If the grouting pressure exceeds 250 psi (2 MPa) gauge, inject grout at a vent that has been or is ready to be capped.
 - a. Maintain a one-way grout flow while injecting.
 - b. Fit the vent used for injection with a positive shutoff.
 - c. If a one-way flow of grout cannot be maintained, immediately flush the grout out of the duct with water.
6. Pump grout through the duct and waste it continuously at the outlet pipe until the following happens:
 - No visible slugs of water or air are ejected.
 - The efflux time of the ejected grout is at least 11 seconds.
7. To ensure that the duct remains filled with grout:
 - a. Close the outlet.
 - b. Hold pumping pressure for an additional 15 seconds and then close the inlet.
 - c. Do not remove or open plugs, caps, or valves used to close off the outlet or inlet until the grout has set.

N. Place Rust Inhibitor

If prestressing and grouting are not completed within 10 consecutive days after installing steel strands in the ducts (or within 30 days in the case of bars), use rust inhibitor in the ducts.

Prestressing steel installed but not grouted within the specified number of consecutive days is subject to the limits in Subsection 509.3.06.C, "Rust Limits." If the Engineer directs, remove rejected tendons at no cost to the Department.

Do not reuse prestressing steel that has been detensioned. Replace detensioned prestressing steel.

O. Paint Steel Parts

Paint steel parts exposed in the completed structure as follows:

1. Field clean the parts according to Subsection 535.3.03.A, "Clean New Steel Structures."
2. Field paint the parts according to System IV of Section 535.
3. Paint the ends of strands according to System IV of Section 535.

509.3.06 Quality Acceptance

A. For Prestressing Concrete Bridge Members

Use grout that has a minimum compressive strength of 3,000 psi (20 MPa) at 28 days, as determined by ASTM C 109.

B. Tendon Standards

Individual wires in a 7-wire strand or wires in a parallel wire tendon may fail if the total area of wire failure is not more than 2 percent of the total cross-sectional area of tendons in any member.

Failure of an entire strand will be subject to structural review.

C. Rust Limits

Prestressing steel will be rejected when:

- The opened package (pak) of prestressing steel has an even coating of rust or rust film over the entire pak.
- One or more wires in a strand are rusted throughout their length.
- A length of strand or bar contains clinging rust, pits, or other faults.

Prestressing steel will be accepted when:

- Rust film can be removed by light rubbing, leaving light streaks or spots but no pitting.
- Rust forms during the 10 consecutive days (or 30 consecutive days for bars) between the installation of steel in the ducts and the prestressing and grouting.

509.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

509.4 Measurement

Prestressing cast-in-place concrete is measured as an accepted lump quantity, complete in place.

The Contract Lump Sum price paid for prestressing cast-in-place concrete will be full compensation for the following:

- Furnishing labor, materials, tools, equipment, and incidentals
- Doing Work to furnish, place, and tension the prestressing steel in cast-in-place concrete structures complete in place and as specified on the Plans and in these Specifications

509.4.01 Limits

A. Tests

Tests performed by the Contractor will not be paid for separately but will be considered incidental to the project.

No additional payment will be made for testing prestressing anchorage blocks. Costs associated with performing the test, including materials, equipment, and labor, will be included in the bid price for prestressing.

B. Additional Compensation

No additional compensation will be made for the following:

- Furnishing and placing additional deformed bar reinforcing steel, ducts, anchoring devices, saddles, distribution plates or assemblies, and incidental parts
- Furnishing samples for testing
- Performing testing
- Grouting recesses
- Pressure grouting ducts

Full compensation will be included in the Contract Lump Sum price paid for prestressing cast-in-place concrete.

509.5 Payment

Payment will be made under:

Item No. 509	Prestressing cast-in-place concrete, Bridge No. _____	Per lump sum
--------------	---	--------------

509.5.01 Adjustments

General Provisions 101 through 150.

Section 510—Protective Platforms

510.1 General Description

This work consists of furnishing materials, erecting, maintaining, removing, and disposing of protective platforms that provide additional safety for underpassing traffic during construction of grade separation structures.

510.1.01 Definitions

General Provisions 101 through 150.

510.1.02 Related References

General Provisions 101 through 150.

510.1.03 Submittals

A. Location of Vertical Clearance Signs

The Engineer will approve the exact location of vertical clearance signs.

510.2 Materials

General Provisions 101 through 150.

510.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

510.3 Construction Requirements

510.3.01 Personnel

General Provisions 101 through 150.

510.3.02 Equipment

General Provisions 101 through 150.

510.3.03 Preparation

General Provisions 101 through 150.

510.3.04 Fabrication

General Provisions 101 through 150.

510.3.05 Construction

Construct and maintain the protective platform so that no object or liquid will fall from the bridge superstructure or the platform to the roadway below. This protection is the Contractor's liability and responsibility.

Place protective platforms under spans that pass over pedestrian or vehicular traffic lanes. Place the platforms immediately after setting the beams and before working on the span.

Place the platforms immediately after the beams are set and before performing other work on the span.

A. Meet Platform Specifications

Construct protective platforms to meet the following specifications:

1. Platforms shall extend at least 3 ft (1 m) beyond each side of the outside limits of the structure.
2. Platforms shall completely cover the length of the spans over the traveled ways.
3. Platforms shall maintain the minimum vertical clearance shown on the Plans over the traffic lanes.

B. Construct and Remove Protective Platforms

Construct and remove the platforms as follows:

1. Post W 12-2 signs stating "Low Clearance, (the dimension shown on the Plans)" in the following locations so traffic approaching the bridge site from both directions can see them.
 - Approximately 500 and 1,000 ft (150 and 300 m) from each side of the bridge
 - On the exterior sides of the bridge superstructure
2. Construct the protective platforms to meet the specifications listed in Subsection 510.3.05.A, "Meet Platform Specifications" and follow these requirements:
 - a. Keep protective platforms in place until all superstructure work, including painting, final rubbing, and clean-up, is complete.
 - b. If the platforms fail to provide the required protection, stop operations on the spans affected and take remedial action. Do not begin operations again until the platforms are repaired.
3. Remove the protective platforms and the W 12-2 signs.

The platforms remain the Contractor's property.

C. Consider Other Protective Platforms

The following may be considered satisfactory protective platforms under the following conditions:

1. **Stay-in-Place Metal Deck Forms.** Stay-in-place metal deck forms are satisfactory protective platforms between girders.
Below the deck-form elevation, however, protective platforms are required for edge beam, diaphragm, or other construction.
2. **Precast, Prestressed Concrete Deck Panels.** Precast, prestressed concrete deck panels are satisfactory protective platforms under the same conditions as stay-in-place metal deck forms.
3. **Overhang Brackets.** Overhang brackets are satisfactory protective platforms under the following conditions:

- a. The brackets are floored at least 12 in (300 mm) beyond the outside edge of a slab with a handrail.
- b. The brackets have a 8 in (200 mm) curb board.
- c. The Contractor uses temporary mobile or hanging protective platforms when erecting and removing the overhang from the work.

510.3.06 Quality Acceptance

A. Enforcing Compliance

If the Contractor fails to comply with the requirements in this Specification, the Engineer will shut down the Contractor's operations. The Engineer may also withhold any monies until these requirements are met.

510.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

510.4 Measurement

This work is not measured separately for payment.

510.4.01 Limits

General Provisions 101 through 150.

510.5 Payment

The cost of protective platforms will be included in the overall bid submitted. This price includes furnishing materials and erecting, maintaining, removing, and disposing of the platforms.

510.5.01 Adjustments

General Provisions 101 through 150.

Section 511—Reinforcement Steel

511.1 General Description

This work consists of furnishing and placing bar reinforcement steel and superstructure reinforcement steel.

511.1.01 Definitions

General Provisions 101 through 150.

511.1.03 Submittals

A. Mill Orders and Shipping Statements

Furnish three copies of mill orders and shipping statements for fabricated reinforcement steel bars, both black and epoxy, to the Office of Materials. The purchase orders shall include the following:

- Complete State Project number, including the name(s) of the county(ies)
- Company name and order number of the Contractor
- Name and address of the fabricator
- Bar sizes and total weight

B. Bar Lists and Calculated Weights

Furnish the Engineer with copies of the fabricator’s bar lists and calculated weights. The Engineer will compare these copies to the Plan quantity.

511.2 Materials

A. Bar Supports Requirements

Bar reinforcement shall meet the requirements of the following Specification, unless specified otherwise on the Plans or in the Special Provisions. For a list of bar support sources, see QPL 19.

Material	Section
Steel Bars for Concrete Reinforcement	853.2.01

1. Wire Supports

Make wire bar supports from one of the following materials:

- a. Galvanized Wire: Use cold-drawn wire that is hot-dipped and zinc-coated to meet the requirements of ASTM A 153/A 153 M, Table 1, Class D, Weights of Zinc Coatings.
- b. Stainless Wire
 - 1) For nominal heights of 3-1/2 in (90 mm) and under, the legs may be fabricated from cold-drawn, weldable, stainless steel wire containing at least 16 percent chromium.
 - Ensure that the wire provides a minimum tensile strength of 85,000 psi (585 MPa) for bolsters and of 100,000 psi (690 MPa) for high chairs.
 - 2) For nominal heights exceeding 3-1/2 in (90 mm), the legs may be fabricated from cold-drawn, carbon steel wire (non-stainless steel) with stainless steel extensions attached to the bottom of each leg.
- c. Bright Basic Wire: You may use bright basic wire (no corrosion protection) for any support placed at least 3/4 in (20 mm) clear from a formed surface. Use the same wire sizes as that specified for galvanized wire in Subsection 511.2.A.1.a, “Galvanized Wire” above.
- d. Plastic Protected: For bar supports that come in contact with a removable form, use cold-drawn, carbon steel wire. Protect the wire with plastic and use only in these types of bar support configurations: SB, BB, JC, HC, BC, and CHC (see)
 - 1) If using Plastisol for dipping, ensure that it meets the following criteria:
 - Tensile strength: 1,500 to 2,000 psi (10 to 13.5 MPa)
 - Shore A hardness: 80 to 100 durometers
 - 2) If molding plastic legs of polyethylene to the top wire, use polyethylene that meets ASTM D 1248.

- e. Epoxy Powder Coated Wire: Use epoxy powder that has satisfactory flexibility, adhesion, and does not conduct electrical current.
 - f. Plastic Supports: Plastic bar supports may be fabricated from virgin or recycled plastic. Supports shall be molded into a configuration that does not restrict concrete flow and consolidation around and under the supports. The supports shall be able to withstand a load of 300 lbs. (660 kg) without exhibiting any breakage or visible deformation. When tested according to ASTM D 570, the water absorption shall not exceed 0.1%.
 - g. Mortar Blocks: Precast mortar blocks used as spacers and supports shall be made of cement and concrete sand with a 1:2 cement-sand ration and shall have wires cast into them for fastening to the steel. Support faces shall be approximately parallel and smooth. The blocks shall be moist cured for a minimum of three (3) days.
2. Tie Wire
- Use at least No. 16 gauge, black, soft iron wire to tie bar reinforcement steel.

B. Fabrication

Comply with the following requirements:

- 1. **Bar Supports.** Fabricate all wire bar supports as per the illustrations given in Table 1.
 - a. Stainless Wire
For nominal heights exceeding 3.5 in (90 mm), attach stainless steel extensions to the bottom of each leg. Design the leg extensions so that no portion of the carbon steel wire will be unprotected closer than 3/4 in (20 mm) from the form surface.
 - b. Plastic Protected
Apply plastic protection by dipping the bar support in plastic or by molding legs to the top wire.
 - 1) Apply a plastic coat at least 3/32 in (2.4 mm) thick at points of contact with the form.
 - 2) Extend the plastic upward on the wire to a point at least 1/2 in (13 mm) above the form.
 - 3) Turn up all legs on wire bar supports at least 1/8 in (3 mm).
 - c. Epoxy Powder Coated Wire
Apply an epoxy powder coat at least 0.006 in (0.15 mm) thick.

"Zig Zag" width: 8 in (200 mm) min.

If the top wire on continuous supports are not designated as corrugated, the Manufacturer may use either straight or corrugated wire.

- * Refer to the Manual of Standard Practice prepared by the Concrete Reinforcing Steel Institute and the Western Concrete Reinforcing Steel Institute for bar support illustrations.
- ** To provide adequate stability against overturning, make the leg spread measured between points of support on the minor axis of the support at least 70 percent of the nominal height.
- *** To provide adequate stability against overturning, make the leg spread measured between points of support on the minor axis of the support at least 55 percent of the nominal height.
- **** To provide adequate stability against overturning and to provide adequate load capacity, make the leg spread measured between points of support on the minor axis of the support be between the minimum and maximum percentages of the nominal height, as shown:

Nominal Height, in. (mm)	Distance Between Supports, % of Nominal Height	
	Minimum	Maximum
Under 4 in (100)	70	No limit
4 in (100)	70	95
6 in (150)	65	90
8 in (200)	60	85
10 in (250)	55	80
12 in (300)	50	75
Over 12 in (300)	50	75

2. **Reinforcement Steel.** Fabricate reinforcement steel bars in the planes they were designed for and to the tolerances specified in the Fabrication Tolerances illustration (Figure 1).

Bar dimensions shown on the Plans are out-to-out unless otherwise noted on the Plans.

The maximum allowable deviations out of the design plane are as follows:

Bar Size	Allowable Deviation
No. 7 (22 m) bars and under	1/2 in (13 mm)
No. 8 (25 m) bars and over	1 in (25 mm)

Bend the reinforcement steel to the shapes and dimensions specified on the Plans. Do not rebend and use bars that have been rejected.

Hooks and bends shall comply with the Manual of Standard Practice, prepared by the Concrete Reinforcing Steel Institute and the Western Concrete Reinforcing Steel Institute, unless otherwise shown on the Plans.

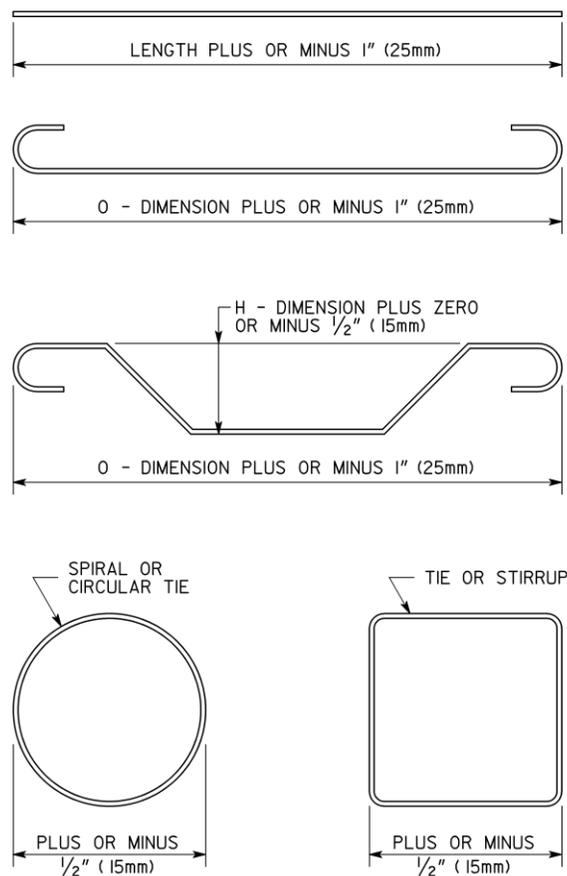

Figure 1 – Fabrication Tolerances

C. Acceptance

1. Plastic Protected Bar Supports

If using Plastisol, test the tensile strength of 1,500 to 2,000 psi (10 to 13.5 MPa) and the Shore A hardness of 80 to 100 durometers.

- a. Test the insolubility of the Plastisol by immersing it in methyl-ethyl-ketone (MEK commercial grade 100 percent solution) for one hour.

- b. Use the “Performance Test Procedure for Plastic Protected Bar Supports” in the CRSI Manual of Standard Practices. Ensure that the plastic does not deform permanently when heated to 170 °F (77 °C).
- c. Reject any material that shows metal exposed at points of contact after being heated.
- d. Reject any material that shatters or severely cracks under an impact loading subjected at 5 °F (–15 °C). Reject any plastic on the fabricated unit that chips, cracks, or peels under ordinary job conditions.

D. Materials Warranty

General Provisions 101 through 150.

511.2.01 Delivery, Storage, and Handling

After reinforcement steel is fabricated by one of the steel fabricators listed on QPL 12, handle and store it as follows:

- Load, transport, unload, and handle reinforcement steel in a way that prevents damage.
- Block unloaded reinforcement steel off the ground and store it in piles separated by size and type.
- Protect reinforcement steel from the weather if prolonged exposure is expected and the Engineer requires the protection.

511.3 Construction Requirements

511.3.01 Personnel

General Provisions 101 through 150.

511.3.02 Equipment

General Provisions 101 through 150.

511.3.03 Preparation

Before placing reinforcement, clean off loose mill scale, rust scale, and coatings that will destroy or materially reduce the bond.

511.3.04 Fabrication

See Subsection 511.2.B, “Fabrication” and Subsection 853.2.01.B, “Fabrication.”

511.3.05 Construction

Bar schedules are shown on the Plans as a service. The Contractor is responsible for conforming to the Plan details. If there is a discrepancy between Plan details and bar schedules, the Plan details take precedence.

Space reinforcement steel within permissible tolerances. Tie and support the reinforcement steel so it cannot move during concrete placement.

Twist bar ties at least two full turns. The Engineer may require double bar ties if single bar ties do not keep the bar reinforcing steel secure under construction traffic.

Tie epoxy-coated reinforcement steel with the epoxy-coated or plastic-coated tie wire specified in Section 853.

Use the following placing requirements:

A. Footing Reinforcement Steel

1. **Footing Ties.** Tie mat steel at each intersection on the outer edges and at alternate intersections within the mat.
2. **Footing Steel Support.** Support mat steel using precast blocks with the maximum dimensions of 4 in x 4 in (100 mm x 100 mm) Plan clearance. Fasten the precast blocks with cast-in wires.
Steel may be supported by other satisfactory means approved by the Engineer. Do not use rocks or random pieces of broken concrete to support steel.

3. **Footing Steel Tolerances.** Place mat steel within 1/2 in (15 mm) vertically from the bottom clearance and 1 in (25 mm) from the side clearance. Do not deviate more than 1 in (25 mm) from the location indicated on the Plans as seen in the Plan view.

B. Column and Wall Dowel Bars

1. **Dowel Bar Position.** Position dowel bars so the column bars or vertical wall bars can be spliced and tied in the location the Plan specifies.
2. **Dowel Bar Support.** Before pouring concrete in any footing, do the following:
 - a. Place dowel bars.
 - b. Construct a rigid template across the top of the footing to support the dowel bars.
 - c. Attach dowel bars to the template so they cannot move during concrete placement.
 - d. Do not push dowel bars into wet concrete after placing the concrete.
3. **Dowel Bar Tolerances.** Place dowel bars within 1/2 in (15 mm) of Plan location. Do not deviate more than 1/4 in (6 mm) on the side clearance.

C. Column Reinforcement Steel

1. **Column Steel Support.** Space steel off side forms using precast blocks with maximum dimensions of 2 in x 2 in x Plan clearance (50 mm x 50 mm). Fasten the blocks with cast-in wires.
2. **Vertical Bar Tolerances.** Place vertical bars within 1/2 in (15 mm) of the location indicated on the Plan. Do not deviate more than 1/4 in (5 mm) on the side form clearance.
3. **Hoop Tolerances.** Place hoops within 1 in (25 mm) of specified locations. Do not deviate more than 1/4 in (6 mm) on the side form clearance.
4. **Hoop Ties.** Tie hoops as follows:
 - a. Tie hoops at intersections with dowel bars and corner vertical bars.
 - b. Tie other vertical bars to at least every third hoop on a staggered basis, both vertically and horizontally.

D. Wall Reinforcement Steel

1. **Wall Steel Support.** Space steel and mat supports as follows:
 - a. Space steel off side forms using precast blocks with maximum dimensions of 2 in x 2 in x Plan clearance (50 mm x 50 mm). Fasten the blocks with cast-in wires.
 - b. Space mat steel using satisfactory spacing devices approved by the Engineer between wall mats. Ensure that the spacing devices provide enough space between steel mats according to the Plans.
2. **Wall Bar Tolerances.** Space wall bars within 1 in (25 mm) for any bar. Do not allow the tolerance to accumulate causing an omission of bars. Do not deviate more than 1/4 in (6 mm) on the side form clearance.

Shift bars more than the tolerance only when necessary to clear a fixture. Do not reduce the number of bars specified for the pour. Place any remaining bars on either side of the fixture to the spacing specified on the Plans and to the tolerance specified in the previous paragraph.
3. **Wall Ties.** Tie wall steel as follows:
 - a. Tie steel at each intersection on the outer edges and at every third intersection within the mat.
 - b. For large walls, tie steel at alternate intersections or at each intersection, if necessary.
 - c. Check for bar displacement after the initial tying and correct it before pouring concrete.

E. Beam and Cap Reinforcement Steel

1. **Beam and Cap Steel Support.** Support beam and cap steel as follows:
 - a. Space upper main longitudinal steel (located below the top bars) vertically using precast blocks with maximum dimensions of 2 in x 2 in x Plan clearance (50 mm x 50 mm). Fasten the blocks with cast-in wires.

- b. Maintain side form clearance using precast blocks with maximum dimensions of 2 in x 2 in x Plan clearance (50 mm x 50 mm). Fasten the blocks with cast-in wires.
 - c. Maintain bottom clearances using approved beam bolsters (see symbol “BB” on the Table of Bar Support Designation Requirements (Table 1).
 - d. Support additional layers of main longitudinal bottom steel in beams and caps that are not bundled from the lower layers with upper beam bolsters placed directly over lower supports. Refer to symbol “SBU” on the Table of Bar Support Designation Requirements (Table 1).
 - e. Space beam bolsters no more than 2 ft (600 mm) from the end of a beam or cap. Additional bolsters will be required at a maximum spacing of 4 ft (1.2 m).
2. **Beam and Cap Steel Tolerances.** Place the bottom and top clearance of a layer of main longitudinal steel within 1/4 in (6 mm) of the Plan vertical dimension for that layer. Do not deviate more than 1/2 in (15 mm) on side form clearance.

Place each stirrup within 1 in (25 mm) of its specified location.

If transverse spacing is not specified on the Plans, ensure that the main steel in beams and in tops and bottom of caps has at least 2 in (50 mm) horizontal clearance between bars.

3. **Beam and Cap Steel Ties.** Tie beam and cap steel as follows:
- a. Tie intersecting bars.
 - b. Ensure that ties on bundled bars are spaced no more than 6ft (1.8 m) apart.
 - c. Ensure that bundled bars have at least three ties per bundle.

F. Box Culvert Slabs

1. **Box Culvert Slab Support.** Support box culvert slabs as follows:
- a. **Support walls.** Place steel supports according to the requirements for walls in Subsection 511.3.05.D, “Wall Reinforcement Steel.”
 - b. **Support bottom slabs.** Place supports for single mat steel or for bottom mat steel according to the requirements for footings in Subsection 511.3.05.A, “Footing Reinforcement Steel.”

If more than one mat of steel is required by the Plans, support the top mat from the bottom mat using upper beam bolsters (SBU) or other satisfactory means approved by the Engineer.

- c. **Support top slabs.** Support the top mat steel of top slabs using either of the following:
 - Continuous high chairs placed near each end of the top bends of truss bars. Refer to symbol “CHC” on the Table of Bar Support Designation Requirements (Table 1).
 - Individual high chairs at a maximum longitudinal spacing of 4 ft (1.2 m). Refer to symbol “HC” on the Table of Bar Support Designation Requirements (Table 1).

Support the bottom mat steel of top slabs as follows:

- 1) Use slab bolsters spaced approximately 12 in (300 mm) from the inside faces of walls. Refer to symbol “SB” on the Table of Bar Support Designation Requirements (Table 1)
- 2) Additional bolsters will be required along the length of the slab at a maximum spacing of approximately 4 ft (1.2 m) to maintain the bottom clearance.
- 3) The Contractor may support bottom mats using precast blocks spaced approximately 4 ft (1.2 m) (maximum) in any direction.

Blocks shall have maximum dimensions of 2 in x 2 in x Plan clearance (50 mm x 50 mm). Fasten the blocks with cast-in wires.

If the Engineer determines that precast blocks do not provide proper support and maintain bottom clearances, use slab bolsters. Refer to symbol “SB” on the Table of Bar Support Designation Requirements (Table 1).

2. **Box Culvert Slab Tolerances.** Place bar reinforcing steel in the walls according to the tolerance requirements in Subsection 511.3.05.D.2, “Wall Bar Tolerances.”

Place top and bottom slab reinforcing bar mats according to the tolerances specified in Subsection 511.3.05.G.6, “Bridge Deck Slab Tolerances.”

3. **Box Culvert Slab Ties.** For top and bottom slabs, tie the reinforcing steel in each layer at the following locations:
 - Each intersection on the outer edges
 - Every third intersection within the mat

G. Bridge Deck Slabs

1. **Bridge Deck Slab Bottom Mat Support—Slab Bolsters.** Support bridge deck slab bottom mat reinforcing with slab bolsters as follows:
 - a. Use lines of longitudinal slab bolsters. Refer to symbol “SB” on the Table of Bar Support Designation Requirements (Table 1).
 - b. Ensure that slab bolsters that contact the forms are corrosion resistant.
 - c. Place slab bolsters along both sides of each beam approximately 6 in (150 mm) to 12 in (300 mm) from the beam edges.
 - d. If the spacing between the lines of bolsters exceeds 4 ft (1.2 m), place an additional row or rows of bolsters parallel to and in between the lines of bolsters so the maximum spacing between the lines of bolsters does not exceed 4 ft (1.2 m).
 - e. If the reinforcement extends 12 in (300 mm) or more past bolsters on curb or median overhangs, place an additional row of bolsters approximately 4 in (100 mm) from the end of the reinforcement.
 - f. On skewed bridges where main (transverse) deck steel is not placed parallel to skew, support discontinuous ends of cutoff transverse bars using slab bolsters. Refer to symbol “SB” on the Table of Bar Support Designation Requirements (Table 1). Place bolsters parallel to skew and as close to the cut ends of bars as possible.
2. **Bridge Deck Slab Bottom Mat Support—Precast Blocks.** The Contractor may support bottom mat reinforcing in the panels between beams using precast blocks instead of slab bolsters as follows:
 - a. Use precast blocks with maximum dimensions of 2 in x 2 in x Plan clearance (50 mm x 50 mm).
 - b. Fasten the blocks with cast-in wires.
 - c. Space the blocks a maximum of 3 ft (1 m) longitudinally.
 - d. Space the blocks transversely according to the requirements for slab bolsters described in Subsection 511.3.05.G.1, “Bridge Deck Slab Bottom Mat Support—Slab Bolsters,” steps c, d, and e.
 - e. If precast blocks do not adequately support the reinforcing steel, use slab bolsters. Refer to symbol “SB” on the Table of Bar Support Designation Requirements (Table 1).
3. **Bridge Deck Slab Top Mat Support Using Continuous High Chairs**
Support top mat reinforcing steel with continuous high chairs as follows, except as noted in Alternate 1 and Alternate 2. Refer to symbol “CHC” on the Table of Bar Support Designation Requirements (Table 1).
 - a. Use a line of longitudinal continuous high chairs. Refer to symbol “CHC” on the Table of Bar Support Designation Requirements (Table 1).
 - b. Place the continuous high chairs 6 in (150 mm) from the edge along both sides of each beam.
 - c. Place another line of continuous high chairs 6 in (150 mm) from each outside edge of the slab.
 - d. If the spacing between the lines of continuous high chairs exceeds 4 ft (1.2 m), place an additional row or rows of continuous high chairs so the maximum spacing between the lines of continuous high chairs does not exceed 4 ft (1.2 m). Refer to symbol “CHC” on the Table of Bar Support Designation Requirements (Table 1).
4. **Bridge Deck Slab Top Mat Support Using Alternate 1.** When truss bars are used for main slab transverse reinforcing, support top mat steel using individual high chairs as follows:
 - a. Place individual high chairs in a line 6 in (150 mm) from the edges along both sides of each beam. Refer to symbol “HC” on the Table of Bar Support Designation Requirements (Table 1).
 - b. Place another line 6 in (150 mm) from each outside edge of the slab.

Maximum spacing for individual high chairs is 3 ft (1 m) longitudinally and 4 ft (1.2 m) transversely.

5. **Bridge Deck Slab Top Mat Support Using Alternate 2.** When truss bars are not used for main slab transverse reinforcing, support top mat steel using continuous high chairs upper as follows:
 - a. Place lines of longitudinal continuous high chairs upper, directly over the lines of longitudinal slab bolsters that support the bottom mat steel. Refer to symbols “CHCU” and “SB” on the Table of Bar Support Designation Requirements (Table 1).
 - b. On skewed bridges where main (transverse) deck steel is not placed parallel to skew, support discontinuous ends of cutoff transverse bars using continuous high chairs (CHC) placed parallel to skew as close to the cut ends of bars as possible.
 - c. On bridges skewed less than 75 degrees, place an additional No. 5 (16M) bar parallel to the skew for the full deck width and as close as possible to the deck joint. Securely tie this bar to the following to maintain correct bar mat location:
 - The underside of the top mat of reinforcing steel
 - The forms
 - The supports (beams)
 - Both forms and supports (beams)
 - d. When using prestressed concrete deck panels, securely tie the top mat of bar reinforcing steel to each shear bar and pick-up loop in the panels. This keeps the top bar reinforcing mat in the correct vertical position.
6. **Bridge Deck Slab Tolerances.** Bridge deck slab tolerances are as follows:
 - a. **Top and Bottom Mat.** Top and bottom clearances for reinforcement steel mats shall be within 1/4 in (6 mm) of the dimension shown on the Plans.
Do not deviate horizontal spacing or end and edge clearances of the mats more than 1/2 in (15 mm) from the spacing shown on the Plans.
 - b. **Curb and Sidewalk Bar.** Place curb and sidewalk bars within 1/2 in (15 mm) in all directions of the Plan dimension.
 - c. **Truss Bar.** If using truss bars in the bridge deck, raise the bar to meet the top clearance specified on the Plans. Do not deviate from the bottom clearance specified on the Plans.
7. **Bridge Deck Slab Bottom Mat Ties.** Tie reinforcing steel as follows:
 - a. Tie the steel at each intersection of the outer edges and every third intersection within the mat unless the steel is coated with epoxy.
 - b. Tie epoxy-coated reinforcing steel at every other intersection within the mat.
8. **Bridge Deck Slab Top Mat Ties.** Tie reinforcing steel as follows:
 - a. Tie the steel at each intersection on the outer edges and every other intersection within the mat unless the steel is coated with epoxy.
 - b. Tie epoxy-coated reinforcing steel at every intersection.

H. Reinforcement Steel Splices

Furnish reinforcement steel in the full lengths shown on Plans. Splice as shown on the Plans. Do not make other splices unless approved by the Engineer.

Place bars in continuous contact on lapped splices. Wire the bars together to maintain a clearance not less than the minimum clear distance to other bars and to the surface of the concrete.

Splice length shall be at least 12 in (300 mm) on No. 4 (13M) longitudinal bars for cast-in-place box culverts, unless indicated otherwise on the Plans.

I. Reinforcement Steel Welds

Weld reinforcement steel only where shown on Plans.

J. Minimum Steel Spacing Requirements

The minimum spacing limitations are as follows unless shown otherwise on the Plans

Clear Distance Between Parallel Bars (Shall be at least the largest measurement listed)	
Cast-in-Place Concrete	Precast Concrete Manufactured Under Plant Control Conditions
1.5 bar diameters	1 bar diameter
1.5 times the maximum size of the coarse aggregate	1-1/3 times the maximum size of the coarse aggregate
1-1/2 in (40 mm)	1 in (25 mm)

511.3.06 Quality Acceptance

Place reinforcement steel and have it inspected and approved by the Engineer before placing concrete.

If this requirement is violated, the Engineer may reject the concrete and require the Contractor to remove it.

511.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

511.4 Measurement

This work is measured for payment as an accepted lump quantity or in pounds (kilograms) of accepted bar reinforcement steel, whichever is shown on the Plans. The Department reserves the right to revise bar reinforcement steel quantities to correct errors and reflect changes on the Plans.

- **Payment Per Lump Sum**
The quantity of bar reinforcing steel measured for payment per Lump Sum basis shall conform to the Plan details and will include reinforcement in concrete handrailings, concrete parapets, and barriers.
- **Payment Per Pound (Kilogram)**
The quantity of bar reinforcement steel measured for payment per pound (kilogram) in bridges and concrete box culverts will be the algebraic sum of the base pay quantity and authorized quantity changes.
Reinforcement bar weight calculations will be made using the theoretical unit weight in pounds (kilograms) per foot (meter) for deformed bars as shown in the table of Deformed Bar Designation Numbers, Units Weights, and Nominal Dimensions (Table 2). This table is taken from ASTM A 615.

Lengths of bent bars will be the sum of the component sections of the bars as shown on the Plans.

Table 2—Deformed Bar Designation Numbers, Unit Weights, and Nominal Dimensions

Bar Designation No.*	Nominal Dimensions			
	Unit Weight lb/ ft (kg/m)	Diameter in (mm)	Cross-sectional Area, in ² (mm ²)	Perimeter in (mm)
3 (10M)	0.376 (0.560)	0.375 (9.5)	0.11 (71)	1.178 (29.9)
4 (13M)	0.668 (0.994)	0.500 (12.7)	0.20 (129)	1.571 (39.9)
5 (16M)	1.043 (1.552)	0.625 (15.9)	0.31 (199)	1.963 (49.9)
6 (19M)	1.502 (2.235)	0.750 (19.1)	0.44 (284)	2.356 (59.8)
7 (22M)	2.044 (3.042)	0.875 (22.2)	0.60 (387)	2.749 (69.8)
8 (25M)	2.670 (3.973)	1.000 (25.4)	0.79 (510)	3.142 (79.8)

Bar Designation No.*	Nominal Dimensions			
	Unit Weight lb/ ft (kg/m)	Diameter in (mm)	Cross-sectional Area, in ² (mm ²)	Perimeter in (mm)
9 (29M)	3.400 (5.060)	1.128 (28.7)	1.00 (645)	3.544 (90.0)
10 (32M)	4.303 (6.404)	1.270 (32.3)	1.27 (819)	3.990 (101.4)
11 (36M)	5.313 (7.907)	1.410 (35.8)	1.56 (1006)	4.43 (112.5)
14 (43M)	7.650 (11.38)	1.693 (43.0)	2.25 (1452)	5.32 (135.1)
18 (57M)	13.600 (20.24)	2.257 (57.3)	4.00 (2581)	7.09 (180.1)

*Bar numbers are based on the number of eighths-of-an-inch included in the nominal diameter of the bars. Metric equivalents are rounded to the nearest whole millimeter.

511.4.01 Limits

A. Construction of Minor Items

No separate measurement or payment will be made for the cost of bar reinforcement steel used in constructing minor items.

B. Prestressed Concrete Bridge Members

Bar reinforcement steel in prestressed concrete bridge members will be considered a component part of the members. The cost shall be included in the Contract Price for prestressed concrete bridge members.

C. Handrail End Posts

Reinforcement steel in handrail end posts that are a part of the superstructure or substructure will be considered part of the superstructure or substructure quantities.

D. Lap Splices

Extra reinforcement steel in lap splices permitted for convenience at splices not shown on the Plans will not be measured for payment.

511.5 Payment

This work will be paid for at the Contract Price per Lump Sum or per pound (kilogram) of bar reinforcement steel, each complete in place.

Payment will be made under:

Item No. 511	Superstructure Reinforcement Steel—Bridge No. _____	Per lump sum
Item No. 511	Bar Reinforcement Steel	Per pound (kilogram)

511.5.01 Adjustments

A. Plan Quantities

Assume the burden of proof for errors of commission or omission in the Plan quantities.

The Department will not consider requests for additional monies because of Plan errors unless they are submitted with the bar lists and weights described in Subsection 511.1.03.B, “Bar Lists and Calculated Weights.” Projects involving multiple bridges or non-skewed concrete box culverts will be considered on an individual basis.

Quantities for bridges and concrete box culverts shown on the Contract Plans (including Standard Plans) will be considered the Base Pay Quantity. Calculated additions or deductions will be applied to the Base Pay Quantity when quantity changes authorized by the Engineer are made. Changes include, but are not limited to, the following:

- Raising or lowering foundations
- Lengthening or shortening concrete box culverts
- Correcting Plan quantity errors or placement details

B. Lump Sum Payment

When authorized quantity changes in the bar reinforcement Plan Quantity are made, Lump Sum payments will be adjusted on a pro-rata basis as follows:

1. If the calculated bar reinforcement weights furnished by the Contractor differ from the Plan Quantity by more than two percent, the Bridge Office will recalculate the plan quantity.
2. If the recalculated Plan Quantity differs by more than two percent from the original Plan Quantity, the Plan quantity will be revised by the Bridge Office to equal the recalculated quantity or the Contractor's quantity, whichever is lower. The Lump Sum payment will be adjusted on a pro-rata basis.

When the Contractor exercises an optional feature of the Plans that results in the only increase or decrease to the Base Pay Quantity, there will be no increase or decrease in payment. However, if the two percent variation is being considered, the effects of the optional feature will favor the Department.

C. Prestressed Concrete Deck Panels

Payment for prestressed concrete deck panels will be 35 percent of the lump sum superstructure reinforcement steel price. Payment will be made after panels are placed.

Payment for post-tensioned box girder bridges will be 35 percent of the lump sum superstructure reinforcement steel price only for the reinforcement steel in the top slab of the box.

Section 512—Shear Connectors

512.1 General Description

This work consists of furnishing and welding shear connectors as shown on the Plans. This work is a Pay Item only when specified in the Contract.

512.1.01 Definitions

General Provisions 101 through 150.

512.1.02 Related References

A. Standard Specifications

Section 501—Steel Structures

B. Referenced Documents

ASTM A 709, Grade 36 (ASTM A 709M, Grade 250)

512.1.03 Submittals

General Provisions 101 through 150.

512.2 Materials

Materials shall meet the following requirements:

- Unless otherwise specified, channel type shear connectors shall be manufactured from structural steel meeting ASTM A 709, Grade 36 (ASTM A 709M, Grade 250).

- Use the stud type shear connectors of the size or diameter and length specified on the Plans. Do not paint or galvanize studs.
Ensure that stud type shear connectors and the welding comply with Subsections 501.3.04.H, and 501.3.06.C, “Welded Construction.”

For a list of sources, see QPL 6.

512.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

512.3 Construction Requirements

512.3.01 Personnel

General Provisions 101 through 150.

512.3.02 Equipment

Ensure that equipment for welding, chipping, and oxygen cutting is designed, manufactured, and maintained so that qualified welders and welding operators can meet the Specification requirements.

512.3.03 Preparation

General Provisions 101 through 150.

512.3.04 Fabrication

General Provisions 101 through 150.

512.3.05 Construction

A. Fabricate Shear Connectors

Fabricate shear connectors according to the Specifications and the Plan details.

1. Channel Type Shear Connectors
Length tolerances for cutting the channel type are plus 1/2 in (13 mm) and minus 1/4 in (6 mm).
2. Stud Type Shear Connectors
The stud length specified shall be the length after welding.

B. Construct Shear Connectors

Shear connectors may be welded to the girder flanges' beam either in the shop or at the site.

In either case, ensure that shear connector welding and construction complies with Subsections 501.3.04.H, and 501.3.06.C, “Welded Construction,” the Plan details, and the following:

1. Before welding, prepare shear connectors and base metal as follows:
 - a. Clean the shear connectors and the base metal of rust, scale, oil, paint, and other harmful substances that would affect the welding operation and the bonding to concrete.
If the connectors are excessively pitted or cannot be cleaned, they will be rejected.
 - b. Wire-brush, peen, prick-punch, or grind the base metal where the shear connectors will be welded. Perform this step only when necessary to obtain satisfactory welds.
2. Do not weld shear connectors when the temperature of the base metal is below 0 °F (-18 °C) or when the surface is wet or exposed to rain or snow.
3. Install shear connectors as follows:
 - a. Channel Type Shear Connectors
Location tolerances for individual connectors are plus or minus 1/4 in (5 mm) from the Plan location. Place connectors at right angles to the beam flanges.

b. Stud Type Shear Connectors

Install stud type shear connectors according to Subsections 501.3.04.I.2, "Paragraph 3.10.1" and 501.3.04.I.3, "Paragraph 4.30.1."

C. Repair Defective Welds

Repair defective welds, shear connectors, and base metals as follows:

1. Channel Type Shear Connectors

Repair channel type shear connectors as follows:

- a. Repair undersized but otherwise sound welds by bringing the weld up to size with additional welding.
- b. Repair undercut caused by the welding process by filling with additional weld metal.
- c. Repair unsound welds as follows:
 - 1) Remove the weld by chipping.
 - 2) If removing unsound welds damages the base metal, repair the base metal by welding and grinding before rewelding the shear connector.
 - 3) Replace the weld with sound welds.

2. Stud Type Shear Connectors

Repair stud type shear connectors according to Subsections 501.3.04.I.2, "Paragraph 3.10.1" and 501.3.04.I.3, "Paragraph 4.30.1."

512.3.06 Quality Acceptance

A. Inspect Welds

The Engineer will inspect and must approve shear connector welds before the Contractor encases them in concrete. The Engineer will inspect them as follows:

1. Channel Type Shear Connectors

The Engineer will visually inspect the welds to determine the following:

- Welds are sound.
- Welds are the size shown on the Plans.
- Welds are the proper profile.

If the Engineer finds defective welds, they shall be repaired at the Contractor's expense as specified in Subsection 512.3.05.C, "Repair Defective Welds."

2. Stud Type Shear Connectors

The Engineer will inspect stud type shear connectors according to Subsections 501.3.04.I.2, "Paragraph 3.10.1" and 501.3.04.I.3, "Paragraph 4.30.1."

512.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

512.4 Measurement

When a Pay Item for shear connectors is specified in the Contract, the quantity measured for payment will be the pounds (kilograms) of installed shear connectors accepted.

Pay quantities will be computed as follows:

1. **Channel Type Shear Connectors.** The weight will be computed for the length and nominal weight per foot (meter) shown on the Plans.
2. **Stud Type Shear Connectors.** The weight will be computed from the nominal dimensions of a stud as shown on the Plans.

512.4.01 Limits

A. Weights

The weights of weld metal flux, arc shield, etc., will not be included in the pay quantity, but their costs shall be included in the Contract Price for this Item.

B. Separate Measurement

Generally, there will be no Pay Item specified for shear connectors in the Contract. Therefore, there will be no separate measurement, and the cost of furnishing and installing the connectors shall be included in the Contract Price for structural steel.

512.5 Payment

When a Pay Item is specified for shear connectors in the Contract, the work will be paid for at the Contract Price per pound (kilogram) for shear connectors of the specified type, complete in place.

Payment will be made under:

Item No. 512	Channel Shear Connectors	Per pound (kilogram)
Item No. 512	Stud Shear Connectors	Per pound (kilogram)

512.5.01 Adjustments

General Provisions 101 through 150.

Section 513—Precast Reinforced Concrete Box Culverts

Barrel Sections and End Sections

513.1 General Description

This work consists of constructing, transporting, joining, and finishing precast box culvert installations (normally as alternates to cast-in-place box culverts) according to Plan details and these Specifications.

Use precast boxes only in these situations:

- Under allowable fill heights designated on the Plan details
- As approved

Design numbers for precast barrel sections refer to Plan designations.

Precast ends refer to precast wingwalls, parapets, apron sections, toewalls, and baffles for outlets.

513.1.01 Definitions

General Provisions 101 through 150.

513.2 Materials

Materials shall meet the requirements of the following Specifications:

Material	Section
Concrete (for Precast Boxes)	843.2.01
All Other Concrete	500
Reinforcing Steel	853
Steel Bolts, Nuts, and Washers	852.2.01
Anchor Bolts	852.2.02
Bituminous Plastic Cement	848.2.05
Preformed Plastic Gaskets	848.2.06
Grout or Mortar	834.2.03
Expanded Mortar	506
Corrugated Steel Pipe (Sleeves)	AASHTO M 36

Backfill	207

513.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

513.2.02 Precast Reinforced Concrete Box Culvert Barrel and End

A. Requirements

Refer to the Standard Specifications or Plan details for the reinforcement steel requirements, concrete strength, maximum fill heights, and minimum cover. Use the design number for the specified size and fill height.

1. Components

- a. Use precast end components that are according to Plan details, notes, and Section 500.
- b. Ensure that the precast wingwalls and aprons are built so that the corrugations of the pipe sleeve insets lock into the concrete and still has the reinforcement steel maintained all around the pipe sleeve insets.
- c. Use modified connector boxes of the type required for connections to precast ends or cast-in-place ends.

Section 513-Precast Reinforced Concrete Box Culverts Barrel Sections and End Sections

- d. Have the manufacturer of the precast ends galvanize and provide all steel bolts, nuts, steel plates, and anchor bolts.
- e. Use pipe sleeves rigid enough to withstand concrete placement, anchoring, and construction loads without damage or excessive deformation.

2. Alternates

The Contractor may, at no additional payment, use precast box sections with a greater span or height than specified on the Plans under the following conditions:

- Minimum cover required for the design number is retained.
- No detrimental effects result from using the larger size.

The Contractor also may substitute a combination for multiple line culverts if the clear height and total clear spans are at least equal to that specified on the Plans.

Submit any alternate designs, alternate materials, or alternate methods of manufacturing to the Department for approval. Include all the necessary details and/or Specifications in the submission.

3. Certification

Submit to the Engineer a certificate from the manufacturer of the precast boxes and precast ends stating that all of the precast box sections and all of the precast end components manufactured in this plant for the use of the Department contain at least the minimum requirements of reinforcement steel specified herein.

- a. Ensure that the certificate is sworn to for the manufacturer by a person having legal authority to bind the company.
- b. Submit the manufacturer's certificate with a guarantee providing the following:
 - 1) All precast box and/or all precast end components will be replaced without cost to the purchaser, if the reinforcement steel does not meet these Specifications.
 - 2) Language so that the guarantee remains in effect as long as the manufacturer continues to furnish precast box culvert barrel sections and precast end sections for use by the Department.

The manufacturer's certificate will not limit the right of the Department to make inspections and checks of the materials in manufactured precast sections prior to and during the construction of the culvert line.

B. Fabrication

Except as otherwise specified on the Plans or in the Specifications, manufacture precast box culvert barrel sections according to AASHTO M 259 or ASTM C 789 and applicable parts of GDT 16.

1. **Lifting.** Cast no more than four handling devices or lifting holes in the top of each box, in each precast wing section, and in each precast apron section.
 - a. Make holes no more than 2 in. (50 mm) in diameter nor more than 2 in (50 mm) square.
 - b. Do not cast lifting holes in the sides or bottom of the boxes.
 - c. Do not lift apron sections or wingwall sections by or through the pipe sleeve insets.
2. **Finishing and Marking.** Put a Type I, ordinary formed surface finish on the precast boxes and precast end components as in Subsection 500.3.05.AB.
 - a. Ensure that the precast boxes and precast end components (except baffles) have the following markings made either by indenting into the concrete or with waterproof paint.
 - 1) Name or trademark of the manufacturer
 - 2) Date of manufacture
 - 3) Box sections (span, rise, maximum fill height, minimum cover, and concrete design strength)

Section 513-Precast Reinforced Concrete Box Culverts Barrel Sections and End Sections

- 4) Ensure that the top of each precast box is clearly indented by marking into either the inner or outer surface of the concrete during manufacture.
 - 5) Ensure that the word "TOP" is painted on the inside top surface of each box in waterproof paint. Ensure that this marking comes from the manufacturer at the plant.
 - 6) When so indicated on the Plans, number and match-mark the sections.
 - 7) Ensure each section bears the Department Inspector's approval stamp.
3. **Precast Parapets.** You may allow the manufacturer to bolt precast parapets to connector box Type P at the manufacturer's plant or at the construction site.
- Have the manufacturer check all precast components for fit and connections before transporting the components to the project.

C. Testing and Inspection

1. Use applicable parts of GDT 16.
2. Determine concrete compressive strength from cylinder or core tests as required by the laboratory.

D. Materials Warranty

General Provisions 101 through 150.

513.3 Construction Requirements

513.3.01 Personnel

General Provisions 101 through 150.

513.3.02 Equipment

General Provisions 101 through 150.

513.3.03 Preparation

A. Excavation, Bedding, and Backfill

Excavate, place bedding, and backfill according to Section 207 and the Plan details.

Place bedding as follows:

1. Place bedding between graded forms set at least 18 in (450 mm) outside each outside wall of the boxes or from the edge of the precast apron sections.
2. Shape the bedding material to fit the bottom of the precast sections.
3. Screed off the graded forms.
4. Grade the bedding surface essentially perfect. The maximum tolerance is plus or minus 1/8 in (3 mm).
5. Ensure that the bedding is level in the plane perpendicular to the culvert center line.
6. Check the grade of the bedding surface on both sides before installing precast sections.
7. After placing the precast sections on the graded bedding, remove and reuse the forms, if needed.

513.3.04 Fabrication

General Provisions 101 through 150.

513.3.05 Construction

Install the structures as required by the Specifications and the Plan details, or as directed by the Engineer. Provide necessary temporary drainage.

Section 513-Precast Reinforced Concrete Box Culverts Barrel Sections and End Sections

A. Install Barrels

Install barrels according to the manufacturer's recommendations.

1. **Multiple Barrel Box Culverts.** Install these box culverts as follows:

- a. Lay precast box culvert sections in the prepared trench with socket ends pointing upstream.
- b. Joint the sections with either bituminous plastic cement or preformed plastic gaskets using these guidelines:
 - In bituminous plastic cement joints, fill the annular space with joint material and wipe smooth the inside of each joint in the barrel.
 - Pull box sections together with a come-a-long or mechanical puller to provide jointing satisfactory to the Engineer.

2. **Multiple Line Box Culverts.** These precast box culverts are the alternative to cast-in-place multiple barrel box culverts.

Where multiple lines are skewed, determine the end treatment method including the positions of the connector boxes, the parapet alignment, and the lengths of wingwalls needed for proper slope intercepts. This must occur before barrel installation begins.

Install multiple culvert lines adjacent to one another according to Plan details.

Use grout (see Subsection 834.2.03, "Mortar and Grout"), a concrete mix, or other material approved by the Engineer as filler material between multiple lines.

B. Protect Structures from Traffic and Loads

Before allowing traffic or loads on the box culvert, provide the depth and width of compacted backfill as shown on the Plans to protect the structure from damage or displacement.

Damaged or displaced structures subjected to construction loads or erosion during installation and backfill shall be repaired at the Contractors expense.

C. Use Ends for Precast Barrels

Use precast or cast-in-place ends as follows:

1. Precast Ends

Precast ends are allowed in the following situations:

- Where either single line or multiple line precast barrels are normal to the roadway
- With skewed single lines or skewed multiple lines at locations shown on the Plans or approved by the Engineer

Do not use precast ends with skewed culverts if the installation would be incompatible with roadway geometrics or would cause other detrimental effects.

- a. **Precast Ends on Skewed Culverts.** Where precast ends are allowed on skews, extend the barrel length so that the precast wing end on the acute side falls approximately at the same point that the cast-in-place long wing end would have fallen, with additional embankment warped to fit.
- b. **Aprons for Precast Wingwalls.** Use precast wingwalls with 8 in (200 mm) thick reinforced concrete aprons for anchor connections.

For sleeve inset fill, use either expanded mortar (see Section 506) or non-shrinking mortar (used immediately after mixing) approved by the Engineer. Do not subject anchors to loads until the mortar sets up.

Use precast or cast-in-place aprons that are multi-piece or monolithic.

- 1) **Precast Aprons.** Carefully place sections to grade upon the screeded bedding described in Subsection 513.3.03.A, "Excavation, Bedding, and Backfill."

Ensure that forms hold bedding for toewalls according to the Plan details and as directed by the Engineer.

Section 513-Precast Reinforced Concrete Box Culverts Barrel Sections and End Sections

Make joints between apron sections water tight.

- 2) **Cast-in-Place Aprons.** Ensure that concrete is set up before installing the wingwalls. Connect wingwalls to apron anchors according to Plan details.
2. **Cast-in-Place Ends.** When required and when not using precast ends, use cast-in-place ends as follows:
 - a. Use cast-in-place ends at the ends of precast box culvert barrels (either skewed or normal).
 - b. Use cast-in-place ends of the same design as cast-in-place box culvert barrels.
 - c. Use aprons with cast-in-place wingwalls only where specified on the Plans or Special Provisions.
 - d. Use cast-in-place ends with multiple precast lines as follows:
 - 1) Minimally increase the standard parapet and toewall widths to accommodate the double inside walls.
 - 2) Use Type C connector boxes between the standard precast boxes and the cast-in-place construction.
 - e. Where there is a skewed alignment or other nondescript alignment condition, the Contractor may cast-in-place a fraction of the barrel between the connector box and the parapet.

D. Finish the Culvert

After precast sections are set in their final position, do the following:

1. Repair spalled areas around the holes.
2. Fill the lift holes with mortar or concrete.
3. Cure the concrete as directed in Subsection 500.3.05.Z, "Cure Concrete."

513.3.06 Quality Acceptance

General Provisions 101 through 150.

513.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

513.4 Measurement

Unless otherwise specified, the Contract includes alternate plans for both precast and cast-in-place box culverts. Plan quantities and payment are based upon the cast-in-place alternate.

A. Precast Box Culvert Barrels

The required linear feet (meter) of culvert will be converted for payment into cubic yards (meters) of Class A Concrete and pounds (kilograms) of reinforcement steel. These measurements will come from the standard or special design computation tables for cast-in-place box culverts.

Multiple line precast box culverts will be measured as a multiple barrel cast-in-place box culvert of the specified size.

B. Ends for Barrels

Wingwalls, parapets, toewalls, and aprons may be either precast or cast-in-place. Plan quantities and payment for these items are based upon the cast-in-place design quantities.

C. Backfill

Foundation backfill material Type II, when required, will be measured according to Subsection 207.4, "Measurement".

513.4.01 Limits

No additional payment will be made when barrel lengths, apron areas, backfilling, or other items are increased due to using the precast alternate.

The following items will not be paid for:

Section 513-Precast Reinforced Concrete Box Culverts Barrel Sections and End Sections

- Connecting hardware
- Mortar
- Joint materials
- Filler material used between multiple precast culvert lines

513.5 Payment

Payment for Precast Reinforced Concrete Box Culvert Barrel Sections and End Sections will be based on the cast-in-place alternate and will include conversions when using the precast design. Cast-in-place concrete will be paid for under Section 500 and reinforcing steel will be paid for under Section 511.

Payment for Foundation Backfill Type II will be made according to and Subsection 207.5, "Payment."

513.5.01 Adjustments

General Provisions 101 through 150.

Section 514—Epoxy Coated Steel Reinforcement

514.1 General Description

This work consists of furnishing and placing epoxy coated bar reinforcement steel according to these Specifications.

514.1.01 Definitions

General Provisions 101 through 150.

514.1.02 Related References

A. Standard Specifications

Section 511—Reinforcement Steel

Section 853—Reinforcement and Tensioning Steel

B. Referenced Documents

QPL 38

AASHTO M284

514.1.03 Submittals

A. Mill Orders and Shipping Statements

Submit mill orders and shipping statements as required in Subsection 511.1.03.A, "Mill Orders and Shipping Statements."

514.2 Materials

When choosing an epoxy coating material, the Contractor may do either of the following:

- Use an epoxy coating material from QPL 38 of acceptable, powdered epoxy resins and their manufacturer.
- Use powder that meets AASHTO M284.

Ensure that uncoated, deformed steel bars meet the applicable requirements of Subsection 853.2.01, "Steel Bars for Concrete Reinforcement."

Allow the Office of Materials to sample and test materials any time.

A. Epoxy Coating Requirements

1. Notify the Office of Materials at least two weeks before blast cleaning the steel reinforcement bars and applying the epoxy coating. This time will allow the Department to schedule an inspection.
2. You may request, in writing, that the Department accept the coating on the basis of a Certificate of Compliance. If the Department approves your request, you must meet the following conditions:
 - a. Ensure that the coating applicator has a quality assurance program approved by the Department.
 - b. Furnish the Department a Certificate of Compliance from the coating applicator with each shipment of coated bars. Ensure that the Certificate of Compliance:
 - Verifies that the coated bars and coating material have been tested in accordance with the requirements of this Specification
 - States the actual test results for each requirement
 - States that the test results comply with the requirements
3. Submit from the coating applicator at the time of shipping a written certification attached to a completed Form 166-A. Ensure that the certificate states that the coated reinforcing bars meet the requirements of this Specification.
4. The epoxy for the fabrication shop repair work shall also be suitable for use in the field by the Contractor installing the coated bars in the bridge deck.

B. Fabrication

1. Immediately before applying the epoxy coating, blast clean all surfaces of the steel bars to a near-white surface finish as per the Steel Structures Painting Council Surface Preparation Specification, SSPC-SP10, for Near-White Blast Cleaning.
 - a. Make the blast-cleaned surface correspond with either pictorial standard A Sa 2½, B Sa 2½, or C Sa 2½ of SSPC Vis 1.
 - b. Clear the surfaces of all dust and grit.
2. Coat all tie wires, clips, chair and bar supports, and other metallic materials used to install the epoxy-coated reinforcing bars with either:
 - The same powdered epoxy resin with a minimum thickness of 6 mils (0.15 mm)
 - A plastic material approved by the Office of Materials
3. Coat the ends of the coated bars cut during fabrication with the epoxy used for repairs.
4. Repair damaged areas and coat the ends of cut bars within 12 hours and before any visible rusting appears.

C. Acceptance

1. The Office of Materials will inspect the application and the finished coating at the applicators plant, according to the provisions of Subsection 106.03, "Samples, Tests, Cited Specifications," or will accept the Certificate of Compliance under the conditions listed in Subsection 514.2.A.
2. Grant the Department Inspector free access to the coating applicator's plant.
 - a. The Inspector may have any or all of the work specified in this section performed in his or her presence.
 - b. Furnish the Inspector with check samples of the coated bars on a random basis as the Inspector deems necessary for testing by the Office of Materials.

D. Materials Warranty

General Provisions 101 through 150.

514.2.01 Delivery, Storage, and Handling

Before using epoxy coated steel bars, carefully load, unload, and store them on the Project site to prevent damage or contamination.

Handle the bars as follows:

1. Use systems for handling coated bars that have padded contact areas for the bars whenever possible.
2. Use padded bundling bands.
3. To prevent sags in the bar bundle, lift bundles with a strong back, multiple supports, or a platform bridge. Sags in the bundle cause bar-to-bar abrasion.
4. Do not drop or drag bars.

514.3 Construction Requirements

514.3.01 Personnel

General Provisions 101 through 150.

514.3.02 Equipment

General Provisions 101 through 150.

514.3.03 Preparation

General Provisions 101 through 150.

514.3.04 Fabrication

A. Fabrication Shop Repair Work

Refer to Subsection 514.2.B, "Fabrication"

514.3.05 Construction

A. Install Bars

To protect and preserve the epoxy coating, install coated bars in the bridge deck according to Subsection 511.3.05, "Construction," this Specification, and the Engineer's directions.

Have the Engineer approve additional splices to accommodate lengths suitable for coating equipment.

Cleaning and repair methods and materials for coated bars are subject to the Engineer's approval.

Install the bars as follows:

1. During and after installing bars into their deck locations, repair cuts, nicks, and abrasions in the bar coating with the epoxy repair material supplied by the powdered epoxy resin manufacturer.
Repair damaged areas within 12 hours and before visible rusting appears.
2. Before they rust, repair damaged reinforcing steel and metallic accessories with the epoxy repair material supplied by the powdered epoxy resin manufacturer.
3. If small damaged areas are rusted, thoroughly remove the rust by sand blasting or other approved methods before repairing the areas.
4. Provide a rust-free and completely coated steel reinforcement system before placing the concrete in the deck to prevent subsequent rusting.
5. When the coated bars are incorporated into the work, keep them free from dirt, paint, oil, grease, or other foreign substance.
6. When necessary, clean the bars to the satisfaction of the Engineer.
7. Place the deck concrete using methods and equipment that will not damage the coated materials.
8. Since the epoxy coating is flammable, do not expose the coated bars to fire or flame. Do not cut coated bars by burning.

514.3.06 Quality Acceptance

General Provisions 101 through 150.

514.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

514.4 Measurement

The accepted epoxy coated steel reinforcing bars will be measured according to Subsection 511.4, "Measurement."

514.4.01 Limits

A. Theoretical Weight of Uncoated Bars

The Department will not add to or deduct from the theoretical weight per foot (meter) of the uncoated bars because of additional Specification requirements for blast cleaning and epoxy coating of the bars.

514.5 Payment

The accepted epoxy-coated steel reinforcing bars will be paid for according to Subsection 511.5, "Payment."

Payment will be made under:

Item No. 514	Epoxy Coated Bar Reinforcement Steel	Per pound (kilogram)
Item No. 514	Epoxy Coated Superstructure Reinforcement Steel, Bridge No. _____	Per lump sum

514.5.01 Adjustments

A. Additional Splices

Additional splices requested to accommodate lengths suitable for coating equipment will be subject to the Engineer's approval. Additional splices will be at the Contractor's expense.

B. Additional Expenses

Additional expenses incurred by the Contractor or suppliers because of the requirements in this Specification are considered incidental. These expenses are included in the Contract Price per pound (kilogram) or per Lump Sum.

Section 515—Handrail-Ferrous Metal and Pipe

515.1 General Description

This work consists of placing handrail and posts made of ferrous metal pipe. It shall include setting anchorages, preparing bearing areas, and painting or galvanizing the handrail, whichever the Plans require.

515.1.01 Definitions

General Provisions 101 through 150.

515.1.02 Related References

ASTM A 153/A 153 M

515.1.03 Submittals

General Provisions 101 through 150.

515.2 Materials

All materials shall meet the requirements of the following Specifications.

Material	Section
Structural Steel	851
Malleable Iron Castings	854.2.04
Steel Castings	854.2.05
Steel Pipe	847.2.01
Steel Bolts, Nuts, and Washers	852.2.01
Paint	870
Plain Steel Bars—Threaded Ends	852.2.02

515.2.01 Delivery, Storage, and Handling

Handle the rails and posts carefully to minimize damage to shop paint or galvanizing.

515.3 Construction Requirements

515.3.01 Personnel

General Provisions 101 through 150.

515.3.02 Equipment

General Provisions 101 through 150.

515.3.03 Preparation

General Provisions 101 through 150.

515.3.04 Fabrication

General Provisions 101 through 150.

515.3.05 Construction

A. Fabricate Handrail

Fabricate handrail as follows. All fabrications shall meet the applicable Specifications of Subsections 501.3.04.H and 501.3.06.C, “Welded Construction.”

1. **Fabrication Material.** Fabricate handrail from plates, shapes, bars, pipe, castings, or from combinations of these materials as shown on the Plan details.
2. **Handrail Not Supported on Concrete Parapets.** When erected bridge handrail will not be supported on a concrete parapet, fabricate the handrail so posts will be plumb.
3. **Stairways on Grades.** On handrail for stairways on grades, use adjustable malleable iron fittings where required or weld the handrails to the posts when specified on the Plans.

4. **Welding Requirements.** Welding shall meet the requirements of Subsections 501.3.04.H and 501.3.06.C, “Welded Construction.”

Grind smooth all welds except fillet welds. Do not grind fillet welds; leave them as they are.

5. **Galvanizing.** Before galvanizing, complete all cutting, welding, and fabrication of rails, posts, bolts, set screws, and other components.

Galvanize material according to the following standards:

Material	Standard
All material except hardware	ASTM A 123/A 123M
Hardware	ASTM A 153/A 153M

6. **Shop Painting.** If metal or pipe handrail, posts, and their component parts will not be galvanized, paint them with the type of shop paint required on the Plans.

All painting shall meet the requirements of Section 535.

B. Construct Handrails

Construction shall meet the applicable Specifications of Subsections 501.3.04.H and 501.3.06.C, “Welded Construction.”

Construct handrail according to the Plan details and as follows:

1. **Set Anchor Bolts.** Set anchor bolts using these guidelines:
 - Set the anchor bolts according to the Plan details and ensure that the bolts have the correct spacing and projection.
Projections shown on the Plans are for flat grades and assume no use of shims.
 - On other grades or where shims are needed, modify the projection shown on the Plans so that after all shims, pads, posts, and washers have been placed, the anchor bolt nut can be screwed completely onto the anchor bolt.
 - If the projection is too short, lengthen or replace the bolt (at the Contractor’s expense) as directed by the Engineer.
2. **Prepare Bearing Areas.** Before placing the posts, prepare bearing areas using these guidelines to obtain full contact between the posts or shims and the concrete:
 - Remove all concrete protrusions.
 - Fill all depressions.
 - Ensure that bearing areas for posts are true to grade.
 - Finish concrete with the Type IV—Floated Surface Finish specified in Subsection 500.3.05.AB.5, “Type IV—Floated Surface Finish.”
3. **Erect Handrail.** Erect handrail using these guidelines:
 - Make all rails parallel to grade.
 - Where bridge rail will be supported on a concrete parapet, set handrail posts normal to grade.
 - Set other handrail posts and pipe standards plumb. If necessary, use shims under post bases and floor flanges to achieve plumb posts.
 - Tighten the set screws as detailed on the Plans.
 - Tighten anchor bolt nuts to a snug fit with full bearing on the base of the post.
 - When posts and rails are completely bolted into place, ensure that they are true to line and grade.
4. **Paint Handrail in the Field.** Painting shall meet the Specifications of Section 535.
If metal or pipe handrail, posts, and their component parts are not galvanized, paint them with the type of paint and number of coats required on the Plans.
5. **Repair Galvanized Coating.** Repair damaged galvanized coatings (at the Contractor’s expense) according to Section 645.

515.3.06 Quality Acceptance

General Provisions 101 through 150.

515.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

515.4 Measurement

This work will be measured for payment in linear feet (meters) of accepted handrail. Handrail will be measured along the top rail from out-to-out of the ends of metal rail or from out-to-out of metal end posts, whichever is greater. No deductions will be made for openings at deck expansion joints or at light standards.

515.4.01 Limits

General Provisions 101 through 150.

515.5 Payment

This work will be paid for at the Contract Price per linear foot (meter) for metal or pipe handrail complete in place.

Payment will be made under:

Item No. 515	Ferrous Metal Handrail, Type	Per linear foot (meter)
Item No. 515	Galvanized Steel Pipe Handrail: _____ in (mm) (<u>Type</u>)	Per linear foot (meter)
Item No. 515	Black Steel Pipe Handrail _____ in (mm) (<u>Type</u>)	Per linear foot (meter)

515.5.01 Adjustments

General Provisions 101 through 150.

Section 516—Aluminum Handrail

516.1 General Description

This work consists of placing handrail and posts made of cast, rolled, or extruded aluminum or of combinations of these materials. It also includes setting anchorages and preparing bearing areas.

Plain Steel Bars—Threaded Ends	852.2.02
Galvanizing	852.2.01.B

516.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

516.3 Construction Requirements

516.3.01 Personnel

General Provisions 101 through 150.

516.3.02 Equipment

General Provisions 101 through 150.

516.3.03 Preparation

General Provisions 101 through 150.

516.3.04 Fabrication

A. Fabricate Handrail

Fabricate handrail as follows:

1. Fabrication Material
Fabricate handrail from plates, shapes, bars, pipe, castings, or from combinations of these materials as shown on the Plan details.
2. Handrail Not Supported on Concrete Parapets
When erected bridge handrail will not be supported on a concrete parapet, fabricate the handrail so posts will be plumb.

516.3.05 Construction

A. Construct and Erect Handrail

Construct and erect handrail according to the Plan details and as follows:

1. Set Anchor Bolts

Set anchor bolts as follows:

- a. Set the anchor bolts according to the Plan details and ensure that the bolts have the correct spacing and projection.
Projections shown on the Plans are for flat grades and assume no use of shims.
- b. On other grades or where shims are needed, modify the projection shown on the Plans so that after all shims, pads, posts, and washers have been placed, the anchor bolt nut can be screwed completely onto the anchor bolt.
- c. If the projection is too short, lengthen or replace the bolt (at the Contractor's expense) as directed by the Engineer.

2. Prepare Bearing Areas

Before placing the posts, prepare bearing areas as follows to obtain full contact between the posts or shims or pads and the concrete:

- a. Remove all concrete protrusions.
- b. Fill all depressions.
- c. Ensure that bearing areas for posts are true to grade.
- d. Finish concrete with the Type IV—Floated Surface Finish specified in Section 500.3.05.AB.5, "Type IV—Floated Surface Finish."

3. Protect Contact Surfaces

Where aluminum alloys contact other materials, protect the contact surfaces as detailed on the Plans or as follows:

- a. **Contact with Other Metals or Wood.** Separate the contact surfaces with neoprene pads.
Do not place aluminum alloys in direct contact with copper, copper base alloys, lead, nickel, iron, steel, or wood.
- b. **Contact with Concrete, Stone, or Masonry.** Separate the contact surfaces with neoprene pads.

4. Erect Handrail

Erect handrail as follows:

- a. If the finish on rails or posts is damaged in handling, either repair it to the satisfaction of the Engineer or replace it (both at the Contractor's expense).
- b. Make all rails parallel to grade.
- c. Where bridge rail will be supported on a concrete parapet, set handrail posts normal to grade.
- d. Set other handrail posts plumb. If necessary, use aluminum alloy shims under post bases to achieve plumb posts.
- e. Tighten the anchor bolt nuts to a snug fit with full bearing on the base of the post.
- f. When posts and rails are completely bolted into place, ensure that they are true to line and grade.

516.3.06 Quality Acceptance

General Provisions 101 through 150.

516.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

516.4 Measurement

This work will be measured for payment in linear feet (meters) of accepted handrail. Handrail will be measured along the top rail from out-to-out of ends of aluminum rail or from out-to-out of aluminum end posts, whichever is greater. No deductions will be made for openings at deck expansion joints or at light standards.

516.4.01 Limits

General Provisions 101 through 150.

516.5 Payment

This work will be paid for at the Contract Price per linear foot (meter) for aluminum handrail complete in place.

Payment will be made under:

Item No. 516	Aluminum Handrail, (<u>Type</u>)	Per linear foot (meter)
--------------	------------------------------------	-------------------------

516.5.01 Adjustments

General Provisions 101 through 150.

Section 517—Protective Concrete Collar for Existing Columns

517.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 518—Raise Existing Bridge

518.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 519—Concrete Bridge Deck Overlay

Section 520—Piling

520.1 General Description

This work consists of placing completed piling in structures. The work includes incidentals and additional work except for the following:

- Prestressed concrete cylinder piling (see Project Special Provisions)
- Piling for ground-mounted roadside signs (see Section 636)

Although square, prestressed-concrete piles are a Pay Item under Section 520, have them manufactured, finished, cured, marked, handled, stored at the plant, and shipped from the plant according to Section 865.

The requirements in this Specification are minimal. Comply with the requirements and assume the responsibility for taking additional precautions to complete the work successfully.

520.1.01 Definitions

Plan Driving Objective (PDO): Statement on the Plans specifying the minimum requirements during pile driving. The PDO may require a driving resistance (tonnage [kilonewtons] by formula), a minimum tip elevation, or a combination of these.

Minimum Tip Elevation: Elevation the pile tip cannot stop above. When composite prestressed concrete piling is used, this term will refer to the protruded tip of the Steel H-Pile Section.

Long Pile: A pile more than 50 ft (15 m) in length.

ASTM D 1143

QPL 37

520.1.03 Submittals

A. Template Plan for Positioning Piling

Before driving piling, submit a plan for ensuring piling stability and position, including templates, to the Engineer. Do not drive piling until the plan is approved.

B. Plans for Loading Test Methods

Submit the plans for loading test methods to the Engineer for approval before beginning the work.

Ensure that the test method is logical and can be rationally analyzed by a commonly accepted structural design theory.

C. Loading Test Equipment

Submit the list of equipment for conducting loading tests to the Engineer for approval before beginning the work.

If the testing apparatus is a hydraulic jack, furnish 5 copies of the calibration certification to the Engineer for the equipment, prepared by the manufacturer, an authorized representative, or an approved testing laboratory. Consult the Engineer to find out which laboratories are approved.

520.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Preservative Treatment of Timber Products	863
Timber Piles	861.2.01
Prestressed Concrete Piles Bridge Members	865
Welded and Seamless Steel Piles	855.2.01
Fluted Steel Shell Piles	855.2.02
Steel H-Piles	855.2.03
Steel Bolts, Nuts, and Washers	852.2.01
Aluminum Alloy Sheet and Plate	850.2.01
Metal Caps	862.2.01.A.5

Refer to Subsection 855, "Steel Pile" for Specifications on cast steel-H pile points. For a list of sources, see QPL 37.

Use the following piling types where shown on the Plans:

- Timber piling
- Prestressed concrete piling
- Metal shell piling
- Steel H-piling

Use other piling types when the Plans and Special Provisions require it.

520.2.01 Delivery, Storage, and Handling

A. Timber Piling

Handle timber piling carefully using only non-metallic slings. Do not drop or damage the piling.

Store timber piles on skids above the supporting surface. Keep hardware covered.

B. Prestressed Concrete Piling

Handle prestressed concrete piling carefully to prevent fracture by impact or by excessive bending stress either in storage, during transportation, or when being transferred to the leads. Do not place other materials on the piling during storage or transport.

1. Transporting Prestressed Concrete Piling

Transport prestressed concrete piling using the approved limits of support spacing for the various sizes and lengths of piling. These limits are shown on Standard Plans or on other drawings and are available to the Engineer from the Department.

2. Loading and Unloading Prestressed Concrete Piling

Load and unload piles using the embedded pick-up points placed during manufacture.

3. Storing Prestressed Concrete Piling

Store piles as follows:

- Store piling in single layers directly on the ground only when there is uniform, level bearing for the full pile length.
- To store piles in tiers, support the piling using blocks of uniform thicknesses placed immediately adjacent to the embedded pick-up points and in line vertically.
- Store piling in groups of the same lengths.

4. Placing Piles in the Leads or in Position

When picking up piles from storage and placing them in the leads or in position, use only the single pick-up point, marked with “SP” or a line painted on the pile at the plant, unless noted on the Plans or otherwise directed by the Engineer.

5. Driving Piles

Do not subject prestressed concrete piling to excessive tensile stresses from combining a particular hammer with the soil conditions. Excessive stress may occur, for example, in these situations:

- When encountering hard driving resistance at the point of a long pile

When such situations damage pile, make changes to provide undamaged piling in place. If piles are damaged, the Engineer may require the following:

- a. Reduce the energy delivered to the piling by reducing the stroke, changing the cushioning, or using a lighter ram.
- b. Maintain equivalent energy but use a heavier or lighter ram with a different stroke.
- c. Use a smaller hammer for the easier, initial driving.
- d. Drill pilot holes, jet, or spud. When these driving aids are required or permitted, see Subsection 520.3.05.B, “Drill Pilot Holes” and Subsection 520.3.05.G, “Jet and Spud.”

C. Metal Shell Piling

Do not deform or dent metal shell piling during handling and storage. Place shells to be stored for a prolonged period on enough skids to prevent ground contact and deflection. Keep the shells fully drained.

D. Steel H-Piling

Do not deform or bend flanges on steel H-piling during handling and storage. Place steel H-piling to be stored for a prolonged period on enough skids to prevent ground contact and deflection. Keep the piling fully drained.

520.3 Construction Requirements

520.3.01 Personnel

Furnish enough labor and work to install the complete loading test, including a temporary shelter over the area if the Engineer requires it.

520.3.02 Equipment

A. Hydraulic Jack for Loading Tests

If the hydraulic jack used to apply the loading test changes behavior during use, return the jack to the manufacturer, an authorized representative, or a testing laboratory approved by the Engineer for recalibration.

B. Driving Head

Use a structural steel driving head recommended by the manufacturer as suitable for the type and size of pile being driven. The driving head shall:

- Hold the pile in the proper driving position
- Be constructed to prevent pile damage
- Be constructed to transmit the hammer energy along the pile axis
- Fit loosely enough around the pile head so that the pile can rotate slightly without binding

C. Cushion or Shock Blocks

Replace cushion blocks as necessary to prevent pile damage. Inspect cushions periodically to ensure that they prevent pile damage.

1. Hammer Cushions

Use cushions or shock blocks above the driving head to avoid damaging the pile. Replace used hammer cushions reduced to half their original thickness with new cushions.

Use hammer cushions of a man-made material only such as micarta or aluminum. Do not use materials such as plywood, hardwood, wire rope, and asbestos.

2. Pile Cushions

For prestressed concrete piling up to 24 in (600 mm), provide a suitable pile cushion block for the top of the pile. Use a cushion made of material that does not compress so far that the cushioning effect is lost.

For prestressed concrete piling, 30 in (750 mm) and 36 in (900 mm) square, use an approved solid hardwood pile cushion block at least 6 in (150 mm) thick or an equivalent in the base of the hammer to cushion the hammer ram blow on the pile or follower.

3. Follower Cushions

When a follower is permitted or required, use an approved, square-shaped laminated cushion block between the follower and the top of the pile.

Use a cushion block for a follower that is:

- At least 6 in (150 mm) thick
- Made of 1 in (25 mm) hardwood boards (preferably green) of uniform thicknesses
- Cut to fit the pile head

Subsection 520.3.02.F, "Followers," defines a follower within the scope of these Specifications.

D. Hammers

Regardless of the requirements for hammers in these Specifications, the PDO governs in selecting the hammer. The exception for this is the tabulations for prestressed concrete piling shown in the Energy Rating Table in Subsection 520.3.02.D.1.b. Except for timber piling, drive piling with power hammers of an approved make and model (steam or diesel) that are single-acting (open end diesel) or double-acting (enclosed ram diesel).

When desired, use gravity (drop) hammers to drive timber piling and, within the conditions in Subsection 520.3.02.D.2, "Gravity Hammers," steel H-piling and metal shell piling.

Hammer types and restrictions are as follows:

1. Power Hammers

Maintain power hammers to obtain their potential stroke length and number of blows per minute. Driving resistance values are invalid when these requirements are not met.

If driving resistance values are invalid, stop the driving operations and correct the problem. Do not begin driving until the problem is resolved.

a. Power Hammer Types

Power hammer types include:

- **Steam Hammers.** Use steam or compressed air from boilers or air compressors to power steam hammers.
Use boilers and air compressors with an accurate pressure gauge and capacities and hose sizes at least equal to those specified by the hammer manufacturers.
- **Open-End Diesel Hammers.** Use open-end diesel hammers that allow measurement of the ram stroke length above the top of the hammer.
- **Enclosed-Ram Diesel Hammers.** Use enclosed-ram diesel hammers with a bounce chamber gauge and charts that will evaluate the equivalent energy being produced under any driving condition.

b. Power Hammer Restrictions

Follow these power hammer restrictions:

- **Timber Piling.** Drive timber piling using a power hammer with a maximum energy rating of 22,400 ft-lb (30 400 N·m).
- **Steel Piling.** Drive steel H-piling and metal shell piling using a power hammer with an energy per blow of at least 1 ft-lb (1.4 N·m) but not less than 9,000 ft-lb (12 200 N·m) for each pound (kilogram) of driven weight.
- **Prestressed Concrete Piling.** Except as specified in the following Energy Rating Table, drive prestressed concrete piling using a power hammer with an energy per blow of at least 1 ft-lb (1.4 N·m) for each pound (kilogram) of pile weight, but not less than 15,000 ft-lb (20 300 N·m).

Driving conditions may require hammers with more energy than the minimum required on the Energy Rating Table. However, the Department will not require hammers that have more than the minimum energy rating, regardless of pile length, unless the Plans or Special Provisions specify otherwise.

Energy Rating Table (English)			
Manufacturer's Energy Ratings on Hammers for Prestressed Concrete Piling			
Pile Size (in)	Weight Lb/Ft	Minimum Energy Rating Ft-Lbs , Ft-Tons	
		Ft ■ Lbs	Ft ■ Tons
14 solid	204	22 400	11.2
16 solid	267	22 400	11.2
18 solid	338	32 000	16.0
20 solid	417	32 000	16.0
24 voided	482	32 000	16.0
30 voided	709	39 800	19.9
36 voided	923	50 000	25.0

Energy Rating Table (metric)		
Manufacturer's Energy Ratings on Hammers for Prestressed Concrete Piling		
Pile Size (mm)	Weight kg/m	Minimum Energy Rating N-m
350	304	30 400
400	397	30 400
450	503	30 400
500	621	30 400
600	717	30 400
750	1055	54 000
900	1374	67 800

2. Gravity Hammers

When using a gravity hammer, regulate the drop height to avoid damaging the pile. Do not allow the drop height to exceed 10 ft (3 m) for timber piling and 12 ft (3.7 m) for steel piling.

Ensure that the hammer is marked with its weight to the nearest 50 lbs (25 kg). Upon the Engineer's request, furnish a certified scale weight of the hammer.

Follow these gravity hammer restrictions:

- a. **Timber Piling.** Drive timber piling using a gravity hammer that weighs at least 2,000 lbs (900 kg) but no more than 3,500 lbs (1500 kg).

However, ensure that the hammer has enough weight to obtain the PDO with a maximum fall of 10 ft (3 m).

- b. **Steel Piling.** If desired, substitute a gravity hammer for a power hammer when the quantity of a steel piling type shown on the Bridge Plans Summary of Quantities does not exceed 800 linear ft (245 linear meters), including test pile lengths if any, for that pile type for an individual bridge.

When using a gravity hammer within the scope of the linear foot (meter) condition, ensure that it has enough weight to obtain the PDO with a maximum fall of 12 ft (3.7 m). The maximum allowable hammer weight is 5,000 lbs (2300 kg).

- c. **Prestressed Concrete Piling.** Do not use gravity hammers to drive prestressed concrete piling.

E. Leads

Equip pile driving rigs with leads that allow the hammer to move freely and support piling during driving. Use leads that meet the following requirements:

- The vertical axis of the leads and hammer coincide with the vertical axis of the pile.
- The leads are long and rigid enough to hold the pile in accurate alignment while it is being driven.

However, ensure that the driving rig can slightly adjust the lead position to compensate for minor changes in direction while driving.

When the pile is supported by the material being penetrated or by approved templates, use hammer leads only.

Driving in deep water may require special platform-type templates to ensure piling stability and position (see Subsection 520.1.03.A, "Template Plan for Positioning Piling"). Use templates with enough area to accommodate all persons necessary to perform and inspect the work.

The Engineer may require templates in other necessary locations to ensure piling stability and position.

F. Followers

Do not use inserts of similar type piling placed between the hammer and a pile to keep the hammer above water level or other levels.

Within the scope of these Specifications, a follower is part of the driving mechanism used to drive larger-sized prestressed concrete piling.

Position the follower between the pile head and the hammer driving base to evenly distribute the driving energy across the concrete area of voided-type piling.

Always use followers when driving 36 in (900 mm) prestressed concrete piling. The Department allows followers when driving 30 in (750 mm) prestressed concrete piling.

G. Spuds

Use spuds heavy enough to penetrate through strata or a stratum of firm or hard material to reach the necessary depth.

Control the alignment for battered spudding using templates that maintain the batter. Unless otherwise permitted, use templates to control vertical spudding.

Mark the distance from the top of the spud clearly at 2 ft (600 mm) intervals along the length of the stem.

Use either round or square spud tips for pile driving that meet the following requirements:

- At least as large as the pile to be driven at the spudding location
- If round, no more than approximately 2 in (50 mm) larger than the diameter or diagonal dimension of the pile
- If square, no more than approximately 2 in (50 mm) larger than the lateral dimension or diameter of the pile

H. Jetting Equipment

Provide enough pumping capacity, using at least two jets, to produce a volume and pressure that will freely erode the material next to the pile and the material 6 in (150 mm) below the pile tip.

I. Loading Test Equipment

Furnish the necessary material, tools, equipment (including a constant tension wire with a weight and sheave or a weight and round pin), and incidentals to properly install the complete loading test and a temporary shelter over the area if the Engineer requires it.

520.3.03 Preparation

A. Remove Obstacles

Unless otherwise permitted, remove or cut out portions of obstacles that interfere with attaining the PDO. This will be measured and paid for as described in Subsection 520.4.01.A, "Removing Obstacles."

B. Form the Embankment at Bridge Ends

Before driving piling at bridge ends and unless otherwise shown on the Plans, form the embankment as follows:

1. Make the embankment at bridge ends full depth to the subgrade template except for the stage construction providing a bench for the end bent.
2. Thoroughly compact the embankment as provided in the Specifications.
3. When the Plans or Special Provisions require a waiting period, delay the construction of all or portions of the bridge as required.

The minimum acceptable length of completed full-depth embankment is specified in Subsection 101.11, "Bridge."

520.3.04 Fabrication

General Provisions 101 through 150.

520.3.05 Construction

A. Determine the Pile Length

Use full-length piling when possible, but always use full-length timber piling. Use piling long enough to reach the PDO.

Except for test piles shown on the Plans, pile lengths are based on the lengths assumed to remain in the completed structure.

Provide fresh headings and the additional length necessary to suit the method of operation at no additional expense to the Department. Pile lengths or quantities shown on the Plans are for estimating purposes only.

The Engineer's "Length List" will be available only after the test piles that logically cover the listed bents have been driven and evaluated and required load tests have been performed. The written "Length List" itemizes the number, type, size, and length of pile required per bent.

1. Steel H-Piling or Metal Shell Piling Lengths

Determine and furnish the required lengths of piling in place to reach the PDO, regardless of whether the Plans require test piles or show estimated lengths.

To determine these lengths of piling in place, either drive test piles, make borings, or make other investigations at no additional expense to the Department.

2. Timber Piling Lengths

Have the Department determine the lengths of this piling. Furnish the piling either according to the Plan listing or according to the Engineer's "Length List," as directed.

Lengths for timber piling up to 40 ft (12 m) will be given in 1 ft (300 mm) increments.

Lengths for timber piling over 40 ft (12 m) will be given in 2 ft (600 mm) increments.

3. Prestressed Concrete Piling Lengths

Have the Department determine the lengths of this piling. Furnish the piling according to the Plan listing or the Engineer's "Length List," as directed.

Lengths for prestressed concrete piling 18 in (450 mm) square or smaller will be given in 2-1/2 ft (750 mm) increments.

- a. **Additional Lengths for Prestressed Concrete Piling.** If a prestressed concrete pile, including test pile, is driven below cutoff elevation before reaching the PDO, the Engineer will determine the net additional length required and add this extension length to the written "Length List."
- b. **Composite Prestressed Concrete Piling Lengths.** The composite pile length of composite prestressed concrete piling (with steel H-section tips partially embedded in and partially protruding from the concrete), is the end-to-end length of the concrete.

The total length of the steel H-section and its embedded and protruding tips is as shown on the Plans. The steel sections are incidental to the work.

B. Drill Pilot Holes

When pilot holes are required, drill them to the diameter and approximate depth specified on the Plans.

Backfill voids and holes with sand or other suitable granular material, or other material as indicated on the Plans. This backfill is an incidental part of the work.

The following are not considered pilot holes:

- Holes created by spudding (punching)
- Holes dug to drive piling that is too long to fit leads
- Holes dug to replace a template (if permitted)

Where pilot holes are required in granular material and the material cannot be sealed off using "mudding" drilling methods, drill the pilot hole as follows:

1. Place a casing pipe with a large enough diameter around the boring device.
2. Hold the casing in position until the pilot hole is completed and the pile driving progresses deep enough into the hard material to keep loose material out of the pilot hole.

Drilling pilot holes using casing is incidental to the work.

C. Test Piling

The Plans will normally require test piles only with timber and prestressed concrete piling, including composite piling. However, the Department may require steel H or metal shell test piles.

When the Plans show the design load of a pile as well as a PDO, the design load is shown only for information purposes if a loading test is required.

Ensure that the piling to be loaded is of the size and type and at the locations specified on the Plans or designated by the Engineer.

The Engineer may revise the quantity or location of the Department's test piles.

The Department may designate locations on the Plans where the Engineer will record pile driving data during driving operations. Such piles are designated as "Driving Data Piles."

Follow these requirements when driving:

- Ensure that the cross-sectional dimensions of test piles are the same as the piles that will be part of the completed structure.
- Test piles are generally longer than piles that remain in the completed structure. Regardless of the PDO, drive test piles to their full length, where possible, for exploratory purposes.
- Drive test piles of the length, type, and size designated on the Plans in the locations the Engineer specifies.
- When using timber test piles, peel the piles and drive them next to the piles that will be part of the completed structure. If desired, machine-peel timber test piles and leave them untreated.
- Drive other types of test piles so that they become part of the completed structure.
- Ensure that test piles furnished and driven in permanent locations meet the requirements in Subsection 520.3.05.D.1, "Determine Driving Resistance," and Subsection 520.3.05.A.1, "Steel H-Piling or Metal Shell Piling Lengths."
- Drive test piles to determine required lengths in the Engineer's presence.
- Cooperate with the Engineer to obtain the required data on "Driving Data Piles" as an incidental part of the work. "Driving Data Piles" do not need to be driven before other piling.

D. Evaluate Bearing Capacity

Determine the bearing capacity of piling by determining driving resistance, performing loading tests, or doing a combination of these.

Determine driving resistance for all piling driven regardless of PDO requirements.

1. Determine Driving Resistance

Drive a pile in one continuous operation and determine the driving resistance without delays. However, in soft material the Contractor may, at the Engineer's discretion, determine the driving resistance after delaying driving operations.

Determine the driving resistance of the piling using the appropriate formula for the hammer type. These resistance formulas apply only when:

- The hammer has a free fall.
- The head of the pile is not broomed, crushed, spalled, or excessively crimped.
- The penetration rate is reasonably uniform.

Determining driving resistance by formula is not a Pay Item. Provide the facilities for determining driving resistance by formula as an incidental part of the work.

Driving Resistance Formulas		
Hammer Type	Formula Number	Formula (DR =)
Gravity hammer	1	$\frac{2WH}{S + 0.7}$
Single-acting steam (or air) hammer; open-end diesel hammer	2	$\frac{2WH}{S + 0.2}$
Double-acting, enclosed-ram diesel hammer	3	$\frac{2E}{S + 0.2}$
Double-acting steam (or air) hammer	4	$\frac{2(W + A_p)H}{S + 0.2}$
NOTE: Do not use the manufacturer's bearing chart unless it agrees with the applicable formula above.		

Driving Resistance Formulas (metric)		
Hammer Type	Formula Number	Formula (DR =)
Gravity hammer	1	$\frac{0.167WH}{S + 17.8}$
Single-acting steam (or air) hammer; open-end diesel hammer	2	$\frac{0.167WH}{S + 5.08}$
Double-acting, enclosed-ram diesel hammer	3	$\frac{0.15E}{S + 5.08}$
Double-acting steam (or air) hammer	4	$\frac{0.166(W + A)H_p}{S + 5.08}$
NOTE: Do not use the manufacturer's bearing chart unless it agrees with the applicable above formula.		

The abbreviations in the driving resistance formulas are defined as follows:

Driving Resistance Formula Abbreviations	
Abbreviation	Meaning
DR	Driving resistance in tons (kilonewtons).
W	Weight of the striking part of the hammer in tons (newtons).
H	Height of fall in feet (meters) for gravity, steam, and air hammers. When using Formula 1, the maximum height is 10 ft (3 m) for timber piling and 12 ft (3.7 m) for steel H or metal shell piling.
	Observed average height of fall in feet (meters) for open-end diesel hammers. Record "H" as the average penetration in inches (millimeters) per blow being determined. When rating open-end diesel hammers to comply with energy requirements, use the height of fall as 8 ft (2.4 m).

Driving Resistance Formula Abbreviations	
Abbreviation	Meaning
E	Average equivalent energy in foot-tons (newton-meters) for enclosed-ram diesel hammers. Measure "E" as the average penetration in inches (millimeters) per blow being determined using a gauge attached to the hammer.
A	Area of piston in square inches (meters) for double-acting steam or air hammers.
p	Pressure at the hammer in tons per in ² (pascals) for double-acting steam or air hammers.
S	Average penetration in inches (millimeters) per blow for the last 5 to 10 blows for a gravity hammer and the last 10 to 20 blows for a power hammer.

2. Perform Loading Test

Unless otherwise specified on the Plans, use a test method that conforms to ASTM D 1143, modified for quick load tests.

Use loading apparatus capable of the lesser value of the following:

- For concrete piles, 400 percent of the design load or 500 tons (4450 kilonewtons)
- For steel piles, 400 percent of the design load or 90 percent of the yield strength

The Engineer may increase or decrease the number of loading tests.

Furnish and read the instrumentation necessary to determine the pile settlement under load.

A loaded pile is unsatisfactory when the total settlement under 200 percent of the design load exceeds 1 in (25 mm) or the permanent settlement exceeds 1/4 in (6 mm) using the standard loading procedure in ASTM D 1143 Section 5.

The laboratory will determine the maximum safe design load or the failure load of original loading materials based on the results of the loading test.

The Engineer may require the following piles to be driven further:

- Unsatisfactory piles as defined in the paragraphs above
- Piles without enough maximum safety design or failure loads as determined by the Office of Materials

Perform the loading test as follows:

- Test load piling as required on the Plans, or as directed by the Engineer.
- Furnish and drive the piling to be test loaded.
- Furnish and drive necessary anchor piling.
When the Engineer permits, use piling that will remain in the completed structure after load testing as anchor piles when desired.
- Apply the test loads in equal increments of 10 to 15 percent of the design load.
- Apply the loads at constant 2-1/2-minute time intervals throughout the test.
- After the test is complete, remove the temporary materials. These temporary materials remain the Contractor's property.
- Remove or cut off the piling that will not remain in the completed structure.
Cut off the piling at least 1 ft (300 mm) below the bottom of the footing or the ground line, whichever applies.
- In deep water, have the Engineer direct how much pile to remove.

E. Drive Piling

Drive piling to the PDO shown on the Plans. When the PDO involves only a driving resistance requirement, the Engineer will determine the depth to drive piling. If there is no Plan PDO, drive the piling as directed by the Engineer.

If the Engineer determines that driving results and loading test results require modification, drive the piling to a PDO modified by the Department.

Drive piling as follows:

1. When using pilot holes, drive the piling enough to fix the point firmly and reach the PDO.
2. Drive piling so that it conforms closely with the position and line shown on the Plans.
3. Drive piling of a given type, including test piles, with the same type and size of hammer.
4. Use vibratory or other pile driving methods only when permitted by Special Provisions Plan Notes or directed by the Engineer.
5. Do not damage piling during driving. Pile damage includes:
 - Crushed, spalled, or cracked concrete
 - Split, splintered, or broomed wood
 - Broken piling
 - Shell collapse
 - Steel deformation
6. Do not force piling into the proper position.
7. When driving a prestressed concrete pile, ensure that the pile point is well-seated with reasonable soil resistance before using full driving energy.
8. Determine the driving resistance when driving the pile using the appropriate Driving Resistance Formula.

F. Excavate and Redrive

Do not drive foundation and end bent piling until excavation is nearly complete.

If driving a test pile to the side (one that will not become part of the structure) have it begin penetration at approximately the same ground elevation as if it were driven within the structure.

Redrive piles that are raised or moved while driving adjacent piling.

G. Jet and Spud

Jetting and, unless otherwise noted in the Contract, spudding are considered incidental to the Work.

Unless otherwise permitted by the Engineer, do not jetting or spudding operations lower than 3 ft (900 mm) above the estimated final elevation of the pile tip, or lower than 3 ft (900 mm) above the specified Minimum Tip Elevation to obtain minimum penetration.

When jetting or spudding to drive a prestressed concrete pile, ensure that the pile point is well seated with reasonable soil resistance at the point before using full driving energy.

1. Jetting

When the Engineer permits, use jetting to properly position a pile. Additional driving may be required to determine the final driving resistance when piles are positioned by jetting.

Should additional driving require additional length, the additional expense involved is considered incidental to the Work.

Jetting may be required with any hammer or piling type (including test piling) and at any site. However, jet only when directed or permitted by the Engineer and as follows:

- a. Do not use jets where the Engineer determines that the jets may endanger the stability of embankments or other improvements.
- b. Perform trial jetting to determine whether to jet using one or two jets. Have the Engineer approve the trial run.
- c. Suspend the pile driving that requires jetting until the jetting is accomplished as directed by the Engineer.
- d. Jet either ahead of the actual pile driving or simultaneously with it as the Engineer determines from the results of trials.

Control and dispose of water and solids that run off from the jetting.
- e. Maintain parallel drainage to railroad tracks.

- f. Do not simultaneously drive and jet a prestressed concrete pile unless there is reasonable soil resistance at the pile point.
- g. If using jets and hammers simultaneously as required or permitted by the Engineer, withdraw the jets before reaching the PDO and continue driving to fix the point of the pile firmly and reach the PDO.
- h. After jetting an area completely, recheck the driving resistance of questionable piles.

2. Spudding

If the Plans or Engineer require spudding, do it to facilitate driving.

The Engineer may require advance jetting exploration before deciding whether or not spudding is necessary to penetrate firm or hard material.

H. Cut Off, Splice, and Extend Piling

Cut off pilings at the required elevation. Splice piling driven below this elevation and extend it according to the Pile Splice Details. Ensure that the minimum splice spacing is at least 10 ft. (3 m).

Lengths of cutoff of any piling, including test piles, remain the property of the Contractor. Dispose of cutoff lengths outside the highway right-of-way according to Subsection 104.07, "Final Cleaning Up." If desired, use undamaged pieces of steel H and metal shell cutoff for splice plates, extensions, and reinforcement for steel H-tips.

1. Cut Off Prestressed Concrete Piling

Cut prestressed concrete piling using pneumatic tools, saws, or other approved methods as follows. Do not use explosives.

When the Engineer considers it necessary, use an approved collar when cutting.

- a. Cut back the required amount of concrete at the end of the pile to be extended, leaving the prestressed strand exposed.
- b. Make the final cut at right angles to the pile axis.
- c. When cutting, avoid spalling or damaging the pile below the cutoff elevation.
- d. If the pile is damaged, replace the pile or repair the damage by cutting back to the extent determined by the Engineer. Replace or repair piles at no expense to the Department.

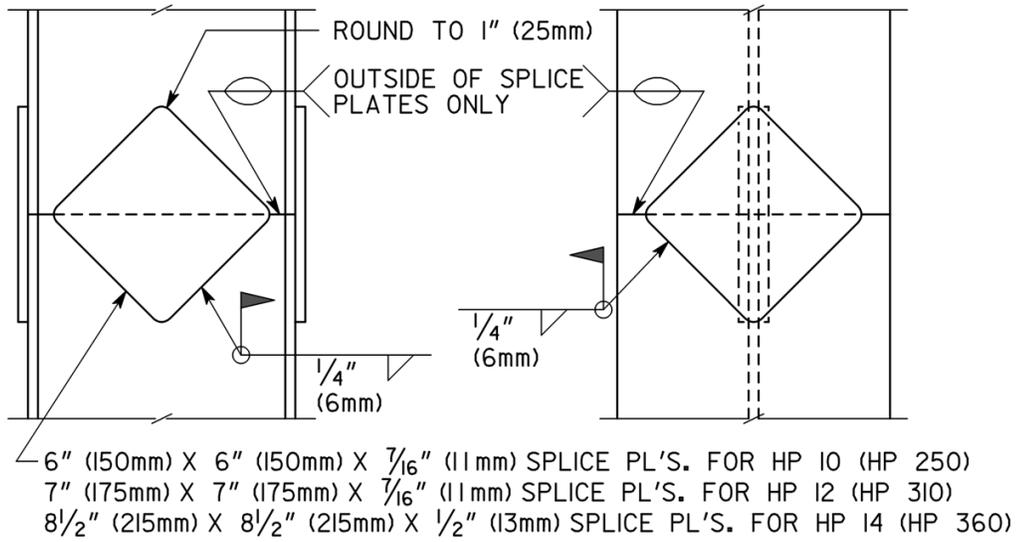

2. Extend Prestressed Concrete Piling

Driven extensions of prestressed concrete piling shall consist of Class AAA concrete. Undriven extensions shall consist of Class A concrete.

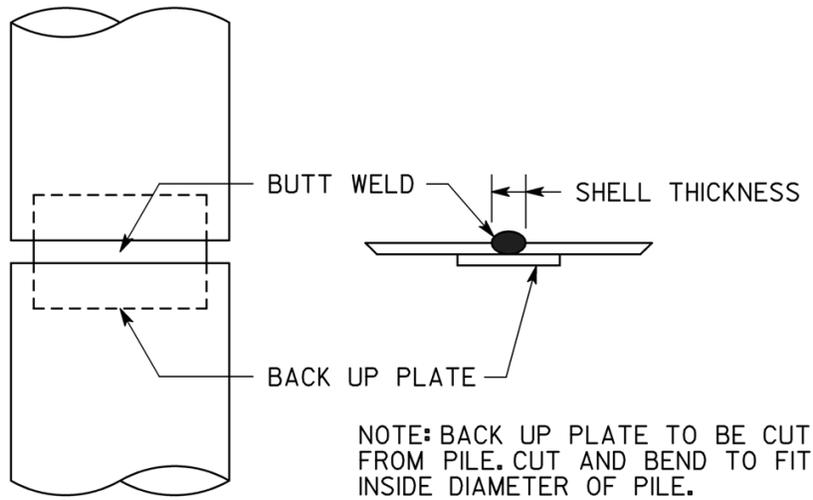

Extend prestressed concrete piling as follows:

- a. Build, place, and brace the form work for the extension carefully to obtain true alignment and prevent leaks at the construction joint.
- b. Just before placing the new concrete, thoroughly wet the cut area and cover it with a thin coating of cement paste.
- c. When driving the extension, chamfer the top 1 in (25 mm) at right angles to the extension axis.
- d. Remove the forms and cure and finish the concrete according to Subsection 865.2.01.B.10, "Concrete Curing" and Subsection 500.3.05.Z, "Cure Concrete."
- e. When extending prestressed concrete piling, comply with the required details when additional driving is or is not necessary after making the extension.

When additional driving is necessary, ensure that the extension reaches its 28-day compressive strength and has been water-cured for 5 curing days before resuming driving. The delay is considered incidental to the Work.

STEEL H PILING

METAL SHELL PILING

Figure 1

3. Splice and Extend Steel H-Piling and Metal Shell Piling

Splice and extend steel H-piling or metal shell piling before, during, or after driving according to the Pile Splice Details [Figure 1]. Ensure that the sections have identical cross sections.

Instead of using the splice details for H-piles shown in the Pile Splice Details (Figure 1), when desired, use approved H-pile splicers as follows:

- a. Ensure that H-pile splicers are the proper size recommended by the manufacturer for the pile to be spliced.
- b. With the splicer in position and before making the splice, ensure that at least 90 percent of the mating ends of the piling to be spliced touch.
- c. Connect the splicer and the piling by welding according to a procedure approved by the Department.

4. Cut Off and Splice Timber Piling

Accurately cut off piling to be capped with timber or precast concrete to obtain true bearing on every pile without using shims.

Replace or repair piles inaccurately cut off at no additional expense to the Department. Replace or repair to the Engineer's satisfaction.

Do not splice timber piling without the Engineer's permission.

I. Weld Steel Piling Splices and Swaybracing Attachments

Weld steel piling splices and swaybracing attachments according to Section 501.3.06.C.

Weld only in the Engineer's presence. Use a welder with current Department certification for welds involved.

J. Repair and Treat Timber Piling

Repair and treat timber piling as follows:

1. Field treat cuts and abrasions in treated timber piling with either of these heated treatments:

- Two applications of a mixture of 60 percent creosote oil and 40 percent roofing pitch
- Two thorough brush coats of creosote oil followed by a covering of roofing pitch

Allow each coat to dry before applying the next.

2. Before placing bolts, field treat holes made after treating with hot creosote oil.

3. Plug unused holes with treated plugs after the field treatment.

4. When the approved use of temporary forms or braces causes nail or spike holes in treated piling, fill the holes using either of these methods:

- Drive galvanized or aluminum nails or spikes flush with the surface.
- Plug the holes with treated plugs after the field treatment.

5. Field treat treated piling heads used in permanent structures that will not be encased in concrete footings or caps after cutoff:

a. Treat the sawed surfaces with either of these heated treatments:

- Three applications of a mixture of 60 percent creosote oil and 40 percent roofing pitch
- Three thorough brush coats of creosote oil followed by a covering of roofing pitch.
- Allow each coat to dry before applying the next.

b. Cover each pile head with a minimum 28-gauge (0.015 in [0.38 mm] thick) metal.

- The metal may be aluminum or galvanized steel. However, aluminum is preferred.
- Trim the metal neatly.
- Bend the metal down around the pile and fasten it to the side using large-headed aluminum or galvanized roofing nails.

K. Bolt Timber Bracing

Bolt permanent timber bracing at its intersections with piles using standard steel bolts and nuts and cast or malleable iron ogee washers. Refer to Subsection 520.2 “Materials”

1. Place an ogee washer under the bolt head and under the nut.
2. Ensure that the diameters of the bolt and the drilled hole are each 3/4 in (19 mm).
3. After adjusting the nuts, burr the bolt threads.

L. Use Prestressed Concrete Piling

Piles cracked in transportation, handling, or storage may be rejected by the Engineer as defective piles if the cracking indicates structural damage.

Piles with cracks that are not structurally damaging that will not be used in sea water or alkali soils may be accepted by the Engineer if the cracks close and are not visible when the pile is in the leads.

When using prestressed concrete piling, comply with the following:

- Do not drive prestressed concrete piles until they reach a minimum strength of 5,000 psi (35 MPa) and a minimum age of 5 days.
- Form vent holes for voided-type piles in one face of each pile at approximately 5 ft (1.5 m) on the centers. Ensure that these holes remain open permanently.
- After completing the driving, cut back and point over cable loops used as embedded pick-up points that remain above the ground or water line.

M. Use Metal Shell Piling

Metal shell piling consists of steel shells filled with Class A concrete after they are driven in place and cut off.

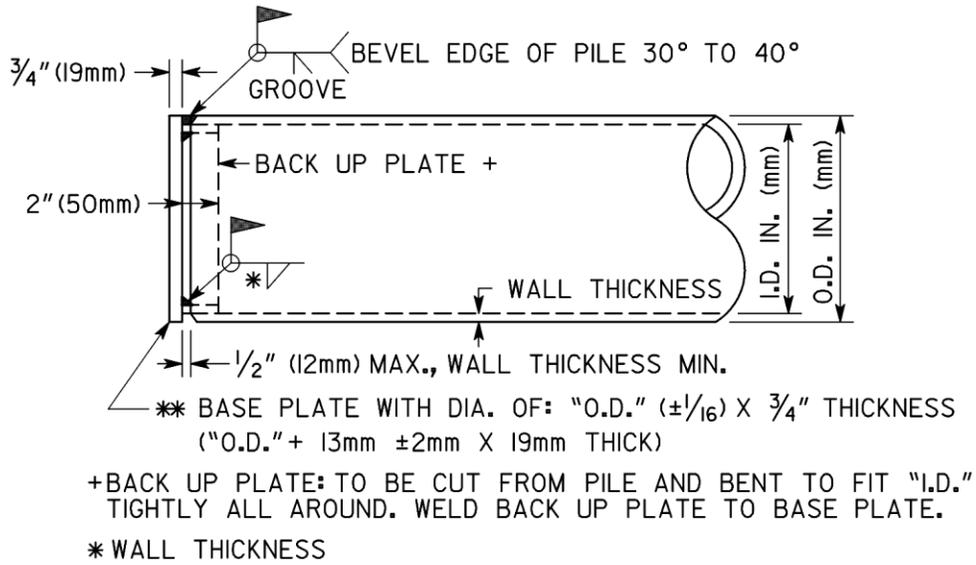

Ensure that the shell’s minimum wall thickness is 1/4 in (6 mm) unless otherwise shown on the Plans. However, furnish shells thick and rigid enough that they can be driven to the PDO without crimping, buckling, or distorting.

The Contractor may use either of the following:

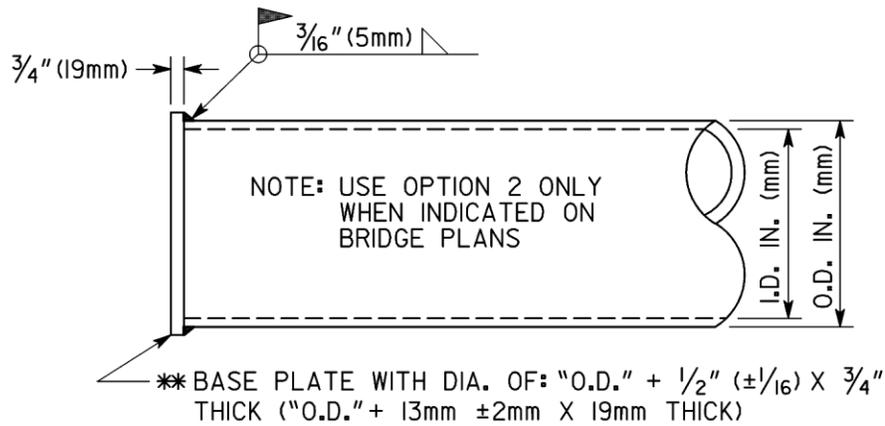

- Shells of constant section
- Shells that meet the requirements of Subsection 855.2.02, “Fluted Steel Shell Pile”

Use metal shell piling as follows:

1. Drive metal shell piling closed-ended.
2. Unless the Plans specify another detail, construct the end closure according to Option 1 of the Closure Plate Detail [Figure 2] so that the closure plate does not project beyond the outside diameter of the pile.
3. After driving, keep the tops of shells covered until the concrete is placed.
4. Ensure that driven shells are clean and free of water immediately before placing concrete. Use a suitable light to inspect the entire length of the shell in place.
5. Before placing concrete, examine the shells for collapse or diameter reduction.
Shells that are broken or are collapsed enough that bearing capacity is materially decreased will be rejected as defective piles.
Fill rejected shells that cannot be removed with Class A concrete at no expense to the Department.
6. When reinforcement steel is required, rigidly assemble and lower it into the shell so that its position is correct during concrete placement.

OPTION 1
FRICTION PILE

OPTION 2
END BEARING PILE

** BASE PLATE: NO MILL TEST REPORT REQUIRED. PLATES WILL BE ACCEPTED ON THE BASIS OF VISUAL INSPECTION

Figure 2

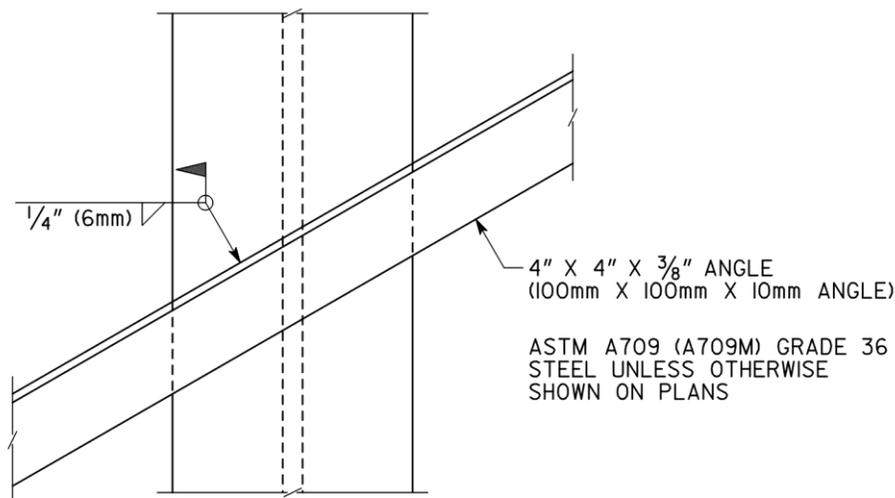

7. Ensure that there are no loose reinforcement steel bars.
8. Do not place concrete in the shells until completing driving within a 30 ft (9 m) radius or until driving shells in any one bent or footing.
If this is not possible, stop the driving within the radius limit until the concrete in the last shell filled reaches a minimum strength of 2,000 psi (14 MPa).
The Engineer may adjust the 30 ft (9 m) limit according to the prevailing vibration conditions.
9. Place concrete in the shells continuously from tip to butt. Where shells contain reinforcement steel, use tremies to pour the concrete.
10. For shells in trestle bents, mechanically vibrate the concrete starting approximately 10 ft (3 m) below the ground and working up.
11. For shells in footings, mechanically vibrate the concrete for approximately 25 ft (7.5 m) downward from the top of the shell pile.
12. Pour footings and trestle bent caps at least two hours after filling the last shell in the footing or trestle bent with concrete.

N. Use Steel H-Piling

Wherever the Plans require HP 14 in by 73 lb (360 mm by 108 kg) steel H-piling, the Contractor may substitute HP 13 in by 73 lb (330 mm by 109 kg) steel H-piling and, as appropriate, 13 in (330 mm) pile tip reinforcement for bearing pile in footings. Do not make this substitution for pile bents. Do not change the Contract Bid Price to make the substitution.

Do not cut or trim steel H-piling to fit into an improperly sized steel driving head. Instead, replace the head with one that conforms to the requirements of Subsection 520.3.02.B, "Driving Head."

Place swaybracing members as shown on the Plans or as required by the Engineer and weld it according to the Swaybracing Attachment Detail [Figure 3].

SWAYBRACE ATTACHMENT DETAIL

Figure 3

If steel H-piles are not driven in the position and to the alignment required, the Engineer may require fills and shims between the bracing and the pile flanges as an incidental part of the Work.

O. Coat and Paint Piling

Apply a special protective coating as described below to steel H-Piling, metal shell piling, steel swaybracing, and when specified, PSC piling. Clean and paint the piling according to Subsections 535.3.03.A, “Clean New Steel Structures,” and Subsection 535.3.05.E, “Paint Steel H-Piling, Metal Shell Piling, and Steel Swaybracing.”

1. Coating Requirements for End-Bent Piling

Clean end-bent piling and coat it with a System IV paint for 2 ft (600 mm) below the bottom of the cap.

As an alternate to coating, pour a concrete collar 2 ft (600 mm) deep with a 3 in (75 mm) cover around the pile.

2. Coating Requirements for Structures Crossing Streams

Coat pilings as follows:

- a. **Piles Not Encased.** For piles within the stream and within 10 ft (3 m) of the top of the stream bank, extend the coating required in Subsection 520.3.05.O.1, “Coating Requirements for End-Bent Piling” for 5 ft (1.5 m) below the stream beds.

Give piles a protective coating 5 ft (1.5 m) below ground line for bents more than 10 ft (3 m) outside each stream bank.

- b. **Piles Encased.** For piles that will be encased according to Section 547, extend the System IV paint 12 in (300 mm) below the top of the encasement.

3. Coating Requirements for Grade Separation Structures

For grade separation structures, extend coatings for intermediate bent piling to 5 ft (1.5 m) below the finished ground line.

520.3.06 Quality Acceptance**A. Reaching the PDO**

The Engineer is solely responsible for determining whether the PDO has been reached satisfactorily.

B. Driving Corrections

Correct driving deviations that exceed 3 in (75 mm) from either the position or the line shown on the Plans as directed by the Engineer.

Do not allow the pile heave from driving nearby piling to exceed 1/4 in (6 mm) without retapping.

C. Correcting Rejected Piles

Rejected piles are:

- Unable to meet material certification
- Damaged by internal defects or by improper driving
- Driven out of proper location as described in Subsection 520.3.06.B, “Driving Corrections”.
- Incorrectly driven below the elevation fixed by the Plans or the Engineer
- Excessively crimped in driving (steel piling)

If cracks develop in a prestressed concrete pile that do not classify the pile as defective, seal the cracks with an approved epoxy crack sealer at no expense to the Department. Place the sealer as directed by the Engineer.

If a pile is driven excessively out of position or below cutoff elevation through no fault of the Contractor, correct it using the method designated by the Engineer at the Department’s expense.

Correct rejected piling at no expense to the Department using one or more of the following methods approved for the pile:

1. Extract the pile and replace it with a new one.
2. Drive a second pile next to the defective pile.

3. Cut off the pile to obtain a fresh heading, splice it, and extend the pile according to Subsection 520.3.05.H, “Cut Off, Splice, and Extend Piling.”
4. Extend the footing or cap concrete to embed the pile properly and change the bar reinforcement steel as required.
5. Delay the Work pending a design analysis (performed by the Contractor with a Department review) and make the corrections specified by the Engineer. The delay is considered incidental to the Work.

520.3.07 Contractor Warranty and Maintenance

A. Unused Piling (Prestressed Concrete or Timber)

Undriven and undamaged whole lengths of piling ordered by the Engineer will become the property of the Department.

Assemble and neatly stack the lengths as directed by the Engineer at a convenient location for loading on Department vehicles.

Guard the lengths against damage or loss for 10 days after notifying the Engineer in writing that the lengths are ready for loading. The 10-day period begins when the Engineer receives the notice.

520.4 Measurement

The items included in this work will be measured for payment as described in Subsection 520.4.01, “Limits.”

520.4.01 Limits

A. Removing Obstacles

When the obstacle removed (see Subsection 520.3.03.A, “Remove Obstacles”) consists of the structure being replaced, and the Department has previously paid for removing the structure, remove or cut the obstacle at no cost to the Department.

When the obstacle consists of another object below the original ground and its removal or cutting is necessary, the removal or cutting is measured as Extra Work if it is not covered by another Pay Item.

Cutting by spudding is not measured for payment.

B. Order Lengths

The Department will not recognize, accept, or pay any claim for adjusting the Contract Unit Prices because of underruns or overruns of estimated lengths or quantities of piling.

C. Test Piling

Accepted test piles required by the Plans or the Engineer are measured per each and paid for at the Contract Unit Price.

Accepted piles furnished and driven as test piles at the Contractor’s option to determine order lengths are measured and paid for the same as for other piling in place of that type used in the completed structure.

Piling measured and paid for as test piles is not included in other measurement for payment.

There is no additional measurement for payment for “Driving Data Piles.”

D. Steel H-Piling and Metal Shell Piling

These piling types are measured in linear feet (meters) of piling in place remaining in the completed work and will be paid for at the respective Contract Price. Measurement does not include piling measured as test piling.

Payment is full compensation for furnishing, driving, jetting, spudding, lining, filling with concrete, disposing of cutoffs, and painting, including special protective coatings.

Pile encasement will be paid for by the linear foot (meter) according to Section 547.5.

Steel swaybracing of steel H-piling will be measured and paid for under Subsection 501.4, "Measurement" and Subsection 501.5, "Payment."

E. Prestressed Concrete Piling and Timber Piling

These piling types are measured in linear feet (meters) of piling in place (plus an allowance for cutoff lengths noted in Subsection 520.4.01.F, "Cutoffs") and paid for at the Contract Price. Measurement does not include piling measured as test piling.

Pay lengths will be based on the Engineer's pile order length.

Payment is full compensation for furnishing, driving, jetting, spudding, lining, disposing of cutoffs, and placing special protective coatings on prestressed concrete piling, if required.

For timber piling, this payment is also full compensation for the costs of furnishing, placing, and removing temporary bracing necessary to hold the piles in alignment.

The pay quantity includes prestressed concrete piling extensions (see Subsection 520.4.01.G.2, "Extensions").

F. Cutoffs

No separate payment will be made for cutting off pile or for using the cutoff lengths of steel H or metal shell piling.

However, cutoff undamaged pieces of steel H or metal shell piling used to make other piles or used as extensions will be paid for as piling in place, described in Subsection 520.4.01.D, "Steel H-Piling and Metal Shell Piling," Subsection 520.4.01.G, "Splices and Extensions," and Subsection 520.4.01.G.2, "Extensions."

G. Splices and Extensions

All extensions and splices are measured and paid for the same way, whether or not the pile is a test pile.

Splicing and extending timber piling, if allowed, will be measured and paid for as Extra Work according to Subsection 109.05, "Extra Work."

1. Splices

For any pile including test piles, each splice per steel H or metal shell pile provided for in the Splice Tabulations will be included in the pay quantities and paid for as a Specification allowance of piling in place in the amounts of 4 linear ft (1.2 m) for steel H-pile and 2 linear ft (600 mm) for metal shell pile.

When the original length of a Department test pile is increased by the Engineer after being driven, each splice required as ordered and accepted is measured for payment in the amount provided above. Other steel pile splices, including others made on test piles, will be performed at the Contractor's expense.

For prestressed concrete piling, each splice ordered and accepted (except those required because of Contractor negligence) will be measured and paid for as a Specification allowance of 5 linear ft (1.5 m) of piling. This payment compensates for the costs of making the actual splice within the limits of the cut-back portion. Include uncompensated costs in the overall bid submitted.

Splice Tabulations	
Steel H or Metal Shell Piling	
In Place Length	Maximum Pay Splices (If Made)
60 ft (18 m) or less	None
Above 60 ft (18 m) through 90 ft (27 m)	1
Above 90 ft (27 m) through 120 ft (36 m)	2
Above 120 ft (36 m) and up	3

Splices will be paid for only when performed.

2. Extensions

The extension of a prestressed concrete pile, including test piles, will be the net length ordered by the Engineer measured from the original pile head to the extended head. This extension is measured as piling.

The actual splice within the cutback portion is measured separately as specified in Subsection 520.4.01.G.1, "Splices."

Extensions required because of the Contractor's negligence are not measured for payment.

The Engineer will determine the length of extensions for the Department's steel H or metal shell test piling. These extensions will be paid for as piling in place according to Subsection 520.4.01.D, "Steel H-Piling and Metal Shell Piling."

H. Alternate to Extending Test Piling

Instead of extending a prestressed concrete test pile that requires additional driving to reach the PDO (as provided in Subsection 520.4.01.G.2, "Extensions."), the Engineer may give the Contractor the option of abandoning the pile as a test pile as far as measurement and payment are concerned.

If the Contractor chooses this option, the Engineer will allow the Contractor to drive a substituted, longer pile of the required length as the test pile at another location selected by the Engineer.

The Engineer will determine the net additional length required. This additional length will be paid for as piling with no splice allowance.

Complete the abandoned test pile, which is measured the same as nontest piles.

The Engineer will not allow the option if the driving data obtained is sufficient or if a loading test is needed instead of further driving.

I. Loading Tests

The number of loading tests completed and accepted will be measured and paid for per each at the Contract Price.

Any loading test or additional stage of loading abandoned because of Contractor fault will not be measured.

J. Cast Steel H-Pile Points

Cast steel H-Pile points of the type and size designated on the Plans are measured per each.

K. Pilot Holes

Pilot holes drilled and accepted as a Contract Item are measured per linear foot (meter) from the natural ground (intermediate trestle bents) or from the bottom of concrete, whichever applies. Pilot holes will be paid for at the Contract Price.

Pilot holes not required by the Plans but made at the request of the Engineer will be measured and paid for as Extra Work according to Subsection 109.05, "Extra Work."

L. Composite Prestressed Concrete Piling

No separate payment will be made for furnishing and driving steel H-pile sections partially embedded in and partially protruding from prestressed concrete piling, including test piles.

M. Unused Prestressed Concrete or Timber Piling

Unused prestressed concrete or timber piling will be paid for at invoiced cost, including transportation plus 10 percent.

520.5 Payment

This work will be measured and paid for at the Contract Prices, complete in place.

Payment is full compensation for all costs of complying with these Specifications, including incidentals and additional work.

Payment will be made under:

Item No. 520	Piling in place, (<u>type</u>), (<u>size</u>)	Per linear foot (meter)
Item No. 520	Piling, (<u>type</u>), (<u>size</u> *)	Per linear foot (meter)
Item No. 520	Test pile, (<u>type</u>), (<u>size</u> *)	Per each
Item No. 520	Loading test, (<u>type</u>), (<u>size</u> *)	Per each
Item No. 520	Pilot holes	Per linear foot (meter)
Item No. 520	H-pile points (<u>type</u>), (<u>size</u>)	Per each
Item No. 520	Cast steel H-pile points (<u>type</u>), (<u>size</u>)	Per each
*For timber piling, size will be omitted.		

520.5.01 Adjustments

A. Test Piles

No deduction will be made when a required test pile underruns in length with the Engineer’s consent.

When a required test pile overruns in length with the Engineer’s consent, see Subsection 520.4.01.G.1, “Splices.”

B. Cutoff Allowances

Cutoff allowances exclude test piling.

Cutoff allowances will be made for each excess linear foot (meter) removed to achieve the cutoff elevation as follows:

- For timber piling, the cutoff allowance is 50 percent of the Contract Price.
- For prestressed concrete piling, the cutoff allowance is 75 percent of the Contract Price.

C. Loading Tests

If the loaded pile does not carry the load satisfactorily after the load is placed and it is necessary to redrive and reload the pile, this reload constitutes an additional stage of loading but not an additional loading test.

Each additional stage of loading made and accepted on any single pile as specified will be measured and paid for as 50 percent of a loading test.

Section 521—Patching Concrete Bridge

521.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 522—Shoring

522.1 General Description

This work consists of furnishing, placing, maintaining, and removing all materials and equipment required for shoring as shown on the Plans and as described in other Special Provisions. It also includes all incidentals and additional work related to shoring.

522.1.01 Definitions

General Provisions 101 through 150.

522.1.02 Related References

A. Related Specifications

General Provisions 101 through 150.

B. Referenced Documents

General Provisions 101 through 150.

522.1.03 Submittals

A. Drawings

The Engineer may require the Contractor to submit drawings of the proposed shoring for review. If this is required, the Contractor shall not start work until the Engineer completes the review. The review will not relieve the Contractor of responsibility for the adequate and safe performance of the shoring.

522.2 Materials

Use materials that meet the requirements of the Plans and Specifications.

The Contractor retains ownership of all shoring materials.

522.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

522.3 Construction Requirements

522.3.01 Personnel

General Provisions 101 through 150.

522.3.02 Equipment

General Provisions 101 through 150.

522.3.03 Preparation

General Provisions 101 through 150.

522.3.04 Fabrication

General Provisions 101 through 150.

522.3.05 Construction

A. Shoring Design

Ensure that shoring is structurally adequate to withstand forces including the following:

- Forces and pressures resulting from excavation
- Forces and pressures of surcharge loads from adjacent structures, roadbeds, tracks, slopes, and equipment

B. Work Standards

Ensure this work conforms to the Sequence of Construction outlined on the Plans and in the Special Provisions.

522.3.06 Quality Acceptance

General Provisions 101 through 150.

522.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

522.4 Measurement

This work is not measured separately for payment.

522.4.01 Limits

General Provisions 101 through 150.

522.5 Payment

This work will be paid for at the Contract Price for shoring complete in place, maintained, and removed.

Payment will be made under:

Item No. 522	Shoring	Per lump sum
--------------	---------	--------------

522.5.01 Adjustments

General Provisions 101 through 150.

Section 523—Dynamic Testing of Pile

523.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 524—Drilled Caisson Foundations

524.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 525—Cofferdams

525.1 General Description

This work consists of designing, constructing, maintaining, dewatering, removing, and disposing of cofferdams, which are necessary for constructing substructures and for protecting personnel and adjacent structures, roadbeds, tracks, channels, slopes, or other property (public or private) whether on or off the Rights-of-Way from water, caving soil, and other dangers.

525.1.01 Definitions

General Provisions 101 through 150.

525.1.02 Related References

A. Standard Specifications

Section 109—Measurement and Payment

Section 211—Bridge Excavation and Backfill

Section 500—Concrete Structures

B. Referenced Documents

General Provisions 101 through 150.

525.1.03 Submittals

A. Drawings

The Engineer may require the Contractor to submit drawings of proposed cofferdams for review. If this is required, the Contractor shall not start work until the Engineer completes the review.

The review will not relieve the Contractor of the responsibility for providing an adequate and safe cofferdam.

525.2 Materials

Materials used in cofferdam construction may be of any type suitable for the design requirements and for the particular dam being constructed, subject to the Engineer's approval.

Earth dams, sand bags, or dams constructed using excavated materials are not considered cofferdam construction.

525.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

525.3 Construction Requirements

525.3.01 Personnel

General Provisions 101 through 150.

525.3.02 Equipment

A. Pumps

Supply sufficient pumping capacity to dewater the cofferdam.

525.3.03 Preparation

General Provisions 101 through 150.

525.3.04 Fabrication

General Provisions 101 through 150.

525.3.05 Construction

A. Designing Cofferdams

Cofferdams shall be structurally adequate to withstand external and internal forces including the following:

1. Forces and pressures from an excavation depth of not less than 6 ft (1.8 m) below the elevation of the bottom of the footing
2. Forces and pressures from surcharge loads from adjacent structures, roadbeds, tracks, slopes, and equipment.

Design the cofferdam to meet these conditions:

- Cofferdams shall permit placing pumping equipment outside the footing forms.
- Cofferdams shall permit driving piling between braces.

B. Correcting Cofferdams

Correct to the Engineer's satisfaction cofferdams that tilt or move laterally during construction.

C. Lowering Cofferdams

Substructure elevations shown on the Plans are approximate; therefore, the Engineer may require that both substructures and cofferdams be lowered by a specified amount.

D. Dewatering Cofferdams

Try to dewater cofferdams without using seal concrete unless the Plans require seals.

1. Dewatering Cofferdams Without Seal Concrete

Use all reasonable methods to provide a dewaterable enclosure, including the following:

- a. Drive all sheeting within the cofferdam to a depth of at least 1 ft (300 mm) below the bottom of the excavation.
- b. Provide a double-walled cofferdam lined with clay or other reasonably impervious material.

The Engineer decides if the Contractor has used all reasonable methods to provide watertight cofferdams.

If the enclosures are not dewaterable, and the Engineer decides the Contractor has not used all reasonable methods to provide watertight cofferdams, the Engineer may do either of the following:

- Require the Contractor to place Seal Concrete at the Contractor's expense.
- Permit the Contractor to place Seal Concrete at the Contractor's expense instead of trying further dewatering methods without a seal.

2. Dewatering Cofferdams with Seal Concrete

If all reasonable methods to provide a dewaterable enclosure have been used and the Engineer determines that seal concrete is necessary, place the concrete as outlined in Subsection 500.3.05.V, "Place Seal Concrete."

When using seal concrete, dewater the cofferdam no earlier than 24 hours after the concrete is placed unless the Engineer determines that a longer period is necessary.

E. Removing Cofferdams

Unless otherwise specified, completely remove all cofferdam material. This material shall remain the property of the Contractor.

525.3.06 Quality Acceptance

General Provisions 101 through 150.

525.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

525.4 Measurement

A. Measuring Cofferdams for Separate Payment

Cofferdams will be measured for separate payment only when set up as a Pay Item on the Plans.

Separate measurement will be made only for cofferdams constructed at the specific locations required on the Plans, regardless of cofferdams built at other locations within the limits of the structure and regardless of site conditions.

The Contractor may request permission to enclose more than one footing in a single cofferdam at a pay measurement location. If the Engineer approves, the number of cofferdams measured for payment will equal the number of footings enclosed within that single cofferdam.

If cofferdams are not set up as a Pay Item on the Plans and their use becomes necessary, they will not be measured for payment.

B. Measuring Lowered Cofferdams for Payment

The following restrictions apply to lowered cofferdams:

1. If lowering a footing requires lowering a separately measured cofferdam, lower the cofferdam enough distance to permit construction at an elevation not to exceed 6 ft (1.8 m) below Plan elevation at the Contractor’s expense.
2. Any lowering of a cofferdam to permit construction at an elevation more than 6 ft (1.8 m) below Plan elevation will be paid for as Extra Work.
3. The Specifications intend that no Extra Work be paid for lowering a separately measured cofferdam until the Contractor completes the cofferdam to the extent that footings or substructure can be successfully constructed at an elevation no more than 6 ft (1.8 m) below Plan elevation.

No Extra Work shall be done under this Item until the requirements of Subsection 109.05, “Extra Work” have been met.

525.4.01 Limits

General Provisions 101 through 150.

525.5 Payment

A. Cofferdams Measured for Separate Payment.

Each cofferdam eligible for separate measurement and payment will be paid for at the Contract Price per each, complete in place, maintained, dewatered, removed, and disposed of.

B. Cofferdams Not Measured for Separate Payment.

The cost of cofferdams not measured for separate payment will be included in the Contract Price for bridge excavation.

If lowering a footing requires lowering a cofferdam not measured for separate payment, the compensation for extra depth excavation provided for in Subsection 211.5.A, “Bridge Excavation”, will be full compensation for the cost of lowering the cofferdam.

Payment for cofferdams eligible for separate measurement will be made under the following:

Item No. 525	Cofferdams	Per each
--------------	------------	----------

525.5.01 Adjustments

A. Partial Payment Adjustments

Partial payment for measured cofferdams will be made as follows:

1. After a satisfactory initial dewatering of the cofferdam, 75 percent of the Contract Price per cofferdam will be included in the next statement.
2. The remaining 25 percent will be included in the next statement after the satisfactory removal and disposal of the cofferdam.

B. Extra Work Qualifications

When the excavation elevation reaches 1.8(2 m) below the Plan elevation and the cofferdam is satisfactory (as determined by the Engineer) for dewatering to that elevation, then any lowering of the cofferdam to permit construction at an elevation more than 6 ft (1.8 m) below Plan elevation will be considered Extra Work.

Section 526—Steel Girder Flooring

526.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 527—Bridge Rehabilitation

527.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 528—Epoxy Pressure Injection of Concrete Cracks

528.1 General Description

This work consists of labor, material, equipment, and services necessary for repairing concrete cracks. The Plans will specify or the Engineer will determine the extent of repair. The work shall comply with the Specifications including Special Provisions where applicable.

528.1.01 Definitions

General Provisions 101 through 150.

528.1.02 Related References

A. Standard Specifications

Section 886—Epoxy Resin Adhesives

B. Referenced Documents

General Provisions 101 through 150.

528.1.03 Submittals

General Provisions 101 through 150.

528.2 Materials

Ensure epoxy used for crack repair complies with the requirements of Section 886, Type V epoxy adhesive.

Ensure epoxy used for sealing cracks at the surface is strong enough to withstand injection pressures up to 250 psi (2 MPa).

528.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

528.3 Construction Requirements

528.3.01 Personnel

General Provisions 101 through 150.

528.3.02 Equipment

A. Injection Equipment

Ensure that dispensing equipment for the injection complies with the following performance requirements:

- Self-monitor pressures of 250 psi (2 MPa) for extended periods under flow.
- Maintain a ratio of accuracy of one percent at the required pressures.
- Mix in-line using a static mixing head.

When using screen wire, wire brushes, or other elements for mixing, provide independent certification that the material is mixing thoroughly at the flow rate and temperatures for the job. Also demonstrate that the unit will not dispense resin if the material line is blocked on the supply or dispense side of the system.

528.3.03 Preparation

Before repairing the cracks specified on the Plans, prepare the concrete surfaces next to the cracks by exposing clean and sound concrete.

The exact procedures for exposing clean and sound concrete shall be the Contractor's option and responsibility. However, the procedures must comply with any traffic handling and construction sequencing requirements for the Project.

528.3.04 Fabrication

General Provisions 101 through 150.

528.3.05 Construction

Seal concrete cracks as follows:

1. After preparing the concrete surfaces, seal the cracks at the surface with epoxy.
Port spacing, location, and port type shall be the Contractor's option and responsibility.
2. If the voids are not thoroughly penetrated, use the following procedure:
 - a. Wet core on 8 in (200 mm) centers the holes that are 1/2 in (13 mm) diameter and 3/4 in (19 mm) to 1 in (25 mm) depth.
 - b. Insert into the cored holes to the full depth copper or plastic tubes 1/2 in (13 mm) diameter and notched at the base.
 - c. Seal the circumference of the ports at the surface.
 - d. Inject the epoxy at a constant pressure not to exceed 250 psi (2 MPa) for at least 10 minutes or until penetration occurs.
3. After the injection operation is complete, clean the sealed cracks to the original concrete surface.
4. Remove nipple devices and surface sealers over the injection holes.

528.3.06 Quality Acceptance

General Provisions 101 through 150.

528.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

528.4 Measurement

No measurement for payment will be made for any material, equipment, or labor necessary to accomplish this Work.

528.4.01 Limits

General Provisions 101 through 150.

528.5 Payment

All costs for material, equipment, or labor shall be included in the Lump Sum price bid for Epoxy Pressure Injection of Concrete Cracks.

Payment will be made under:

Item No. 528	Epoxy Pressure Injection of Concrete Cracks, Bridge No. _____	Per lump sum
--------------	---	--------------

528.5.01 Adjustments

General Provisions 101 through 150.

Section 529—Navigation Lighting

529.1 General Description

This work consists of furnishing and installing navigation lighting (complete or to the extent indicated on the Plans) on bridges and on fender systems where required on the Plans and approved Shop and Work Drawings.

The Specification’s intent is to secure a complete, operational system according to the National Electrical Code and applicable local ordinances.

529.1.01 Definitions

Qualified Electrician: A journeyman electrician with one of the two following classifications:

- Has a Class II license issued by the Georgia State Construction Industry Licensing Board
- Has completed an approved four-year apprenticeship training program

529.1.02 Related References

A. Standard Specifications

- Section 500—Concrete Structures
- Section 645—Repair of Galvanized Coatings
- [Section 852—Miscellaneous Steel Materials](#)
- Section 863—Preservative Treatment of Timber Products
- Section 921—Luminaries
- Section 922—Electric Wire and Cable
- Section 923—Electrical Conduit
- [Section 924—Miscellaneous Electrical Materials](#)

B. Referenced Documents

- National Electrical Code
- ASTM A 123/A 123M

529.1.03 Submittals

A. Contractor Qualifications

The Contractor performing this work must be on the Department’s list of approved electrical contractors or electrical subcontractors.

B. Product Lists

To avoid misunderstanding and ensure compliance with the Specifications, submit to the Engineer for approval a complete list of the products proposed for use before purchasing materials or equipment. Products must comply with Plan requirements to be approved.

The product list shall include the following information:

- Manufacturer’s name for each item
- Manufacturer’s catalog number for each item

Where the Engineer deems necessary, alternate equipment will be specified.

C. Fees and Permits

Pay the fees and obtain the permits required by power companies and governmental agencies.

529.2 Materials

All electrical material shall be approved by the Underwriter’s Laboratory or other acceptable testing agency.

Ensure that materials conform to the requirements of the following Specifications:

Material	Section
Wood Pole	863
Disconnect Switch	924.2.05
Magnetic Contactor	924.2.07
Lightning Arrester	924.2.03
Miscellaneous Electrical Materials	924
Electrical Conduit	923
Ground Rod	924.2.01
Luminaries and Lamps	921
Electrical Wire and Cable	922
Miscellaneous Steel Materials	852
Photoelectric Control	924.2.06

If this Specification or the Plans omit any item needed to install and operate the navigation lighting satisfactorily, include the item in the system.

If necessary, have a qualified person (including a Registered Professional Electrical Engineer) check, verify, or modify (with the Department’s permission) the Contract requirements. The Department will review and approve a person’s qualifications.

529.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

529.3 Construction Requirements

529.3.01 Personnel

A. Qualified Electrician

Have a Qualified Electrician on the job site when electrical wiring is being pulled or electrical connections are being made.

Ensure that the Qualified Electrician possesses evidence of classification and displays this evidence to the Department's engineer in charge of the construction.

529.3.02 Equipment

General Provisions 101 through 150.

529.3.03 Preparation

General Provisions 101 through 150.

529.3.04 Fabrication

General Provisions 101 through 150.

529.3.05 Construction

A. Contractor Guidelines

Comply with the following:

- Local ordinances, rules, and regulations
- The Plans

The Plans are not intended to show the complete details of the overall work, but they will indicate the general layout and designate acceptable manufacturers' equipment.

- Approved Shop and Working Drawings, including drawings by others, if any

B. Contractor Responsibilities

Take responsibility for the following:

- Provide fittings, devices, materials, and work necessary to install the complete, functional system.
Any necessary drilling, cutting, patching, galvanizing repair, and other work required because of misplaced or plugged conduit or improper workmanship shall be done without additional compensation and shall be approved by the Engineer.
- Ensure that electrical work is adequate.

C. Construction Precautions

When a bridge is under construction, provide the lights and other signals necessary for protecting navigation as may be prescribed by the U.S. Coast Guard.

D. Galvanized Steel Items

The following steel items shall be galvanized according to ASTM A 123/A 123M, except the weight of zinc coating per square foot (meter) of actual surface for 1/8 in (3 mm) and 3/16 in (5 mm) steels shall average at least 1.25 oz (375 g) and no individual specimen shall show less than 1.0 oz (300 g).

- Structural steel conduit support angles on fender system
- Junction boxes, except stainless steel
- Conduit clamps and screws
- Luminaire retriever chain and swivel
- Lag screws

Powder-actuated galvanized studs may be of commercial galvanizing quality.

Repair damaged galvanized areas according to Section 645.

E. Conduit, Boxes, Fittings, Wiring, and Supports

Furnish and install as required by the National Electrical Code the conduit, boxes, fittings, wiring, supports, and accessories required to complete the work.

1. Conduit Specifications

Ensure that conduit connections are waterproof.

Provide approved conduit expansion joints at each bridge expansion joint.

Use flexible conduit when going from the bridge superstructure to the substructure, from the bridge to the fender system, and in the transition areas between rigid members.

a. Conduit for Service Risers and Bridges

Unless otherwise shown on the Plans, use 1-1/4 in (32 mm) rigid galvanized steel conduit for the service riser and along the bridge.

b. Underground Conduit

Unless otherwise specified on the Plans, use 1-1/4 in (32 mm) nonmetallic conduit for the underground conduit between the service riser and the bridge. Join underground conduit according to the manufacturer's recommendations and bury it at least 24 in (600 mm).

c. Conduit for the Fender System Walkway

The conduit placed along the fender system walkway may be 1 in (25 mm) size and shall be either liquid tight flexible conduit or rigid galvanized steel conduit. Use the conduit size specified on the Plans.

d. Conduit Connections

Use flexible conduit to connect the rigid galvanized steel conduit located on the faces of pier or bent columns to the conduit located on the fender system walkway.

Ensure this flexible conduit has waterproof couplings and is of sufficient length and slack to permit at least 2 ft (600 mm) of horizontal movement in each direction.

2. Conduit Installation

Install conduit as follows:

a. Install conduit perpendicular to or parallel with the principal structural members.

b. Fit conduit terminals at the junction boxes with bushings.

c. Support the rigid galvanized steel conduit at least every 10 ft (3 m) and within 3 ft (1 m) of junction boxes, luminaires, etc.

d. Use 1/4 in (6 mm) galvanized lag screws and clamps to fasten the conduit to the timber walkway of the fender system.

The Contractor may use powder-actuated galvanized studs and clamps to fasten the following items (located underneath the bridge and down the face of pier or bent columns) to the concrete:

- Rigid galvanized steel conduit
- Expansion devices

3. Specifications of Pull and Junction Boxes

Pull and junction boxes mounted on bridges and the fender system shall be waterproof; shall be made of galvanized steel, stainless steel, or cast aluminum; and shall comply with the National Electrical Code.

There are two options for providing pull and junction boxes to be installed in the ground:

- Construct the boxes according to the Plan design and dimensions and at the locations shown on the Plans. Construct the concrete boxes of Class A Concrete meeting the applicable requirements of Section 500, including precast concrete boxes.
- Furnish and install manufactured boxes approved by the Engineer. Manufactured boxes will be permitted when the Engineer determines they are equal to the boxes constructed of Class A concrete in design, quality, and structural strength. Boxes must meet the requirements of Section 500.

Provide with each pull or junction box cast iron, steel, or reinforced concrete covers as shown on the Plans.

4. Pull and Junction Box Installation

Install pull and junction boxes as follows:

- a. If necessary, use powder-actuated galvanized studs and clamps to fasten junction boxes located underneath the bridge and down the face of pier or bent columns to the concrete.
- b. Seal conduit entrance holes in pull or junction boxes around the conduit as approved by the Engineer.
- c. Blank off unused entrance holes and openings for conduit to be extended by others with suitable plugs of plastic, bituminous fiber, or other material approved to keep out foreign matter.

5. Luminaire Installation

Install luminaires as follows unless otherwise shown on the Plans:

- a. Use the number and diameter of studs, bolts, and lag screws the luminaire manufacturer recommends.
- b. Fasten each channel marker to the bridge with powder-actuated, galvanized, threaded studs or cadmium-plated expansion bolts.
- c. Fasten each fender marker to the timber walkway with galvanized lag screws.

F. Power Supply and Wiring

Unless otherwise noted, the power supply shall be 120/240 volts, 3-wire, and single phase. The Department and the serving electric utility will agree upon the supply point, which in most cases will be near the Rights-of-Way line near the bridge location.

1. Service Pole

Set up a service pole as follows:

- a. To receive the service from the Utility Company (unless otherwise indicated on the Plans or in the Specifications), set up a wood pole that complies with Section 863. The pole shall be at least 30 ft (9 m), Class 5, or as shown on the Plans.
- b. Install the following on the service pole:
 - A metallic service riser with a weatherhead
 - A weatherproof enclosure containing a fusible disconnect switch of the appropriate voltage and ampere rating or as shown on the Plans (see Subsection 529.3.05.H, "Power Control," for information on additional items contained in the waterproof enclosure)
 - An underwriter-approved meter base in the service riser (where required by the power company or where indicated on the Plans)

G. Grounding System Construction

Furnish and install an approved lightning arrester at the weatherproof enclosure on the service pole and connect it to the grounding system.

1. Grounding System

Construct the grounding system as follows:

- Install a ground rod adjacent to the service pole.
- Connect neutral and grounding conductors to the ground rod.
- Install a separate, continuous copper grounding conductor (green) throughout the system.
- Solidly connect metallic, noncurrent carrying materials in the lighting system to the grounding conductor.
- Drive single ground rods vertically until the top of the rod is at least 12 in (300 mm) below the finished ground.
- Attach a length of No. 6 AGW bare copper, 7-stranded wire to the ground rod with suitable ground rod clamps. Connect this wire to the neutral and grounding conductors at the service pole.

2. Ground Rod System

When the above procedure does not result in sufficient penetration, construct a ground rod system as follows:

- a. Place 3 parallel ground rods at least 6 ft (1.8 m) center-to-center in a horizontal pattern and at least 12 in (300 mm) below the finished ground.
- b. Joint and connect these rods to the neutral and grounding conductors at the service pole using suitable ground rod clamps and No. 6 AWG bare copper, 7-stranded wire.

H. Power Control

Unless otherwise specified on the Plans or the Specifications, furnish the following items for each service pole:

- **Photoelectric control complete with receptacle and accessories.** The control shall provide ON operation as indicated under Subsection 924.2.06, "Photoelectric Controls."
- Disconnect switch
- **Magnetic contactor.** The contactor shall supply power to the lighting circuit.
- **Transformer.** If the supply voltage is other than 120/240 volts, furnish and install a transformer to provide 120 volt control voltage
- NEMA-3R lockable weatherproof enclosure(s)

The disconnect switch and magnetic contactor shall have the number of poles required to open each ungrounded conductor and shall be accessible from the ground.

Install the following items as follows:

1. Install the Photoelectric Control

- a. Mount the photoelectric control near the top of the service pole.
- b. Direct the photoelectric control toward the north sky.
- c. Enclose wiring to and from the photoelectric control in rigid galvanized conduit.

The photoelectric control shall operate the magnetic contactor.

2. Install the Disconnect Switch, Magnetic Contactor, and Transformer

Mount the disconnect switch, magnetic contactor, and transformer, if required, in NEMA-3R lockable weatherproof enclosure(s) on the service pole.

3. Install the Weatherproof Enclosure

- a. Install the weatherproof enclosure(s) so that it is accessible from the ground.
- b. Furnish a padlock(s) approved by the Engineer with two keys each for locking the weatherproof enclosure(s). When a project requires more than one padlock, key the padlocks alike.

529.3.06 Quality Acceptance

A. Inspection of the Navigation Lighting System

Materials and workmanship shall meet the requirements of the Plans and these Specifications and shall comply with the National Electrical Code.

The Work shall be inspected by the Department, the utility company involved, and the U.S. Coast Guard. The navigation lighting system shall be approved by both the Department and the U.S. Coast Guard.

If the Coast Guard fails to make its inspection within 30 days, the Department and the utility company will make the final inspection of the navigation lighting system. The Contractor will be relieved of any further responsibility for the system after Department acceptance.

B. Testing and Acceptance of the Navigation Lighting System

Final acceptance of the navigation lighting system will be withheld for a testing period of 30 days. The testing will consist of continuous, nightly, automatic operation after the Contractor completes the lighting work or until all other items in the Contract (except grassing) have been accepted, whichever occurs later. Assume the cost of the electrical energy consumed during the testing period.

Correct any defects in materials or workmanship that occur during the testing period at the Contractor’s expense.

Any portion of the testing period (Subsection 529.3.06.B, “Testing Acceptance of the Navigation Lighting System”) that occurs after final acceptance of the other Work will not be charged against the Contract Time.

529.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

529.4 Measurement

Each navigation lighting system completed and accepted at the location specified will be measured for payment on a lump sum basis. See Subsection 529.1, “General Description.”)

529.4.01 Limits

General Provisions 101 through 150.

529.5 Payment

Each navigation lighting system completed and accepted at the location specified will be paid for at the Lump Sum Price bid for each system. This payment shall be full compensation for furnishing and installing materials and for labor, equipment, and incidentals necessary to complete the Item.

Payment will be made under:

Item No. 529	Navigation lighting, bridge no._____	Per lump sum
--------------	--------------------------------------	--------------

529.5.01 Adjustments

General Provisions 101 through 150.

Section 530—Waterproofing Fabrics

530.1 General Description

This work consists of waterproofing concrete and other masonry surfaces by preparing and applying a composite waterproofing membrane at locations shown on the Plans.

530.1.01 Definitions

General Provisions 101 through 150.

530.1.02 Related References

A. Standard Specifications

Section 500—Concrete Structures

B. Referenced Documents

General Provisions 101 through 150.

530.1.03 Submittals

General Provisions 101 through 150.

530.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Waterproofing Membrane Material	888.2.03
Mortar	834.2.03

For a list of waterproofing membrane sources, see QPL 22.

530.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

530.3 Construction Requirements

530.3.01 Personnel

General Provisions 101 through 150.

530.3.02 Equipment

General Provisions 101 through 150.

530.3.03 Preparation

A. Prepare the Concrete

Prime the concrete and apply the membrane only under the following conditions:

- Air and concrete temperatures are above 40 °F (4 °C).
- All surfaces are thoroughly dry.
- Concrete is at least 14 days old.

Prepare the concrete as follows:

- a. Fill all hole cracks and depressions in the concrete surface flush with mortar composed of one part Portland cement and two parts approved sand and cure according to Subsection 500.3.05.Z, "Cure Concrete."
The Contractor may use approved, commercially produced, fast setting, no sag grouts to expedite the work.
- b. Chip or grind smooth all high spots, sharp points, and edges.
- c. Thoroughly clean and dry the concrete surface.

B. Prime the Concrete

Prime all areas that will receive membrane and allow the areas to cure according to the manufacturer's recommendations or as directed by the Engineer.

Areas not covered with membrane in 24 hours must be reprimed.

530.3.04 Fabrication

General Provisions 101 through 150.

530.3.05 Construction

A. Seal Openings and Structure Edges

At openings for drains and pipes and at the edges of structures, construct a seal to prevent water from passing between the waterproofing and the surface that it overlays.

Apply a manufacturer-recommended edge seal to any area of the membrane permanently exposed to sunlight.

B. Waterproof Joints

Joints require a double thickness of waterproofing membrane over properly sealed expansion, construction, or control joints.

Pre-strip the joint with a 12 in. (300 mm) wide membrane before applying the main waterproofing. The surface of this pre-strip does not need priming.

C. Seal Seams

Edge and end seams must overlap at least 4 in (100 mm) on all applications.

D. Apply Membrane

Apply the membrane as follows:

Rub the entire membrane firmly and completely as soon as possible to minimize bubbles caused by air outgassing or water vapor from the concrete.

Slit all fish mouths, overlap the flaps and repair with a patch pressed or rolled to make the seal. Seal the edges with mastic.

Patch misaligned or inadequately lapped seams with the membrane.

E. Protect Membrane

When necessary, use a manufacturer-approved protection system to protect waterproofing membranes from damage caused by backfill material or other construction activities.

F. Repair Membrane

As soon as possible, patch all tears and inadequately lapped seams with waterproofing membrane.

Slit fish mouths and repair with a patch extending 8 in (200 mm) in all directions from the slit and seal the edges of the patch with mastic.

530.3.06 Quality Acceptance

General Provisions 101 through 150.

530.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

530.4 Measurement

This work will be measured for payment in square yards (meters) of accepted waterproofing.

530.4.01 Limits

General Provisions 101 through 150.

530.5 Payment

This work will be paid for at the Contract Price per square yard (meter) for waterproofing complete in place.

Payment will be made under:

Item No. 530	Waterproofing	Per square yard (meter)
--------------	---------------	-------------------------

530.5.01 Adjustments

General Provisions 101 through 150.

Section 531—Dampproofing

531.1 General Description

This work consists of dampproofing concrete and other types of masonry surfaces.

531.1.01 Definitions

General Provisions 101 through 150.

531.1.02 Related References

A. Standard Specifications

General Provisions 101 through 150.

B. Referenced Documents

General Provisions 101 through 150.

531.1.03 Submittals

General Provisions 101 through 150.

531.2 Materials

Ensure that materials meet the requirements of the following Specifications.

Material	Section
Bituminous Material for Dampproofing or Waterproofing	826.2.01

Unless otherwise specified, Pitch Type I or II shall only be used when required by the Contract. When pitch is required, use Type I on vertical surfaces and Type II on flat surfaces.

Use the primers specified in Subsection 826.2.01 with asphalt and pitch seal coats.

531.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

531.3 Construction Requirements

531.3.01 Personnel

General Provisions 101 through 150.

531.3.02 Equipment

General Provisions 101 through 150.

531.3.03 Preparation

A. Prepare Surfaces

Concrete surfaces shall cure at least 5 days before dampproofing.

Prepare the surface as follows before dampproofing:

1. Thoroughly clean and dry the surface to be dampproofed.
2. Spray at least two applications of primer, allowing primer to be thoroughly absorbed before the next application.

531.3.04 Fabrication

General Provisions 101 through 150.

531.3.05 Construction

A. Dampproof Surfaces

After the final primer coat has been absorbed, dampproof the surface as follows:

1. Evenly apply a seal coat having a temperature of 300 °F (150 °C) to 350 °F (175 °C) for asphalt and 200 °F (90 °C) for pitch.
2. Allow the seal coat to dry at least two days or longer. The seal coat shall be hard before any water or earth contacts it.
3. Protect the seal coat from the weather during the drying period.

531.3.06 Quality Acceptance

General Provisions 101 through 150.

531.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

531.4 Measurement

This work will be measured for payment in square yards (meters) of accepted dampproofing.

531.4.01 Limits

General Provisions 101 through 150.

531.5 Payment

This work will be paid for at the Contract Price per square yards (meters) for dampproofing complete in place.

Payment will be made under:

Item No. 531	Dampproofing	Per square yard (meter)
--------------	--------------	-------------------------

531.5.01 Adjustments

General Provisions 101 through 150.

Section 533—Bridge Deck Waterproofing Membrane

533.1 General Description

This work consists of preparing surfaces for and applying a protective membrane to concrete bridge decks. The membrane shall serve as a waterproof barrier to be overlaid with asphaltic concrete.

The waterproofing method shall be as specified on the Plans and shall be one of the following:

- **Method A:** A waterproofing membrane system placed directly on the Portland cement concrete bridge deck surface.
- **Method B:** A waterproofing membrane system placed directly on a specified grade and thickness of freshly placed asphaltic concrete on the bridge deck.

533.2 Materials

All materials shall meet the requirements of the following specifications:

Material	Section
Asphaltic Concrete	400
Bituminous Prime	412
Bituminous Tack Coat	413
Sand for Blast Cleaning	804
Waterproofing Membrane Materials	888.2.01
Mortar	834.2.03

533.3.01 Personnel

General Provisions 101 through 150.

533.3.02 Equipment

General Provisions 101 through 150.

533.3.03 Preparation

A. Method A Surface Preparation

Cure new bridge decks that will receive waterproofing membrane according to Subsection 500.3.05.Z, “Cure Concrete” without using membrane-forming curing compounds or linseed oil treatments.

Prepare concrete surfaces receiving Method A waterproofing as follows:

1. Chip or grind smooth high spots, sharp points, and edges on the deck surface.
2. Fill holes and depressions in the concrete surface flush with mortar.
Mortar shall be composed of one part Portland Cement and two parts sand and shall be cured according to Subsection 500.3.05.Z, “Cure Concrete.”
Approved, commercially produced, fast setting grout may be used to expedite the Work.
3. Allow the mortar to cure.
4. Clean and remove all traffic paint and other harmful materials from the deck by sand-blasting the entire deck surface to which the waterproofing membrane will be applied.
5. Remove all sand-blasting residue with compressed air. Do not use water to clean the deck.

B. Method B Surface Preparation

Prepare concrete surfaces receiving Method B waterproofing as follows:

1. Prepare the Joints
When the Plans specify to place the waterproofing membrane continuously across any joint, prepare the joints as follows before applying the asphaltic concrete:
 - a. Place an additional strip of preformed sheet membrane transversely across deck joints. This strip shall have a minimum width of 18 in (450 mm) and shall be centered across the joint.
 - b. Apply a mastic (of the type specified by the manufacturer) at the face of the curb and at joints to ensure that the membrane uniformly adheres to the concrete.
2. Apply the Asphaltic Concrete
Once the joints have been prepared, apply the asphaltic concrete as follows:
 - a. Apply a tack coat to the bridge deck at the rate specified by the Engineer.
 - b. Place the specified grade and thickness of asphaltic concrete.
 - c. Compact the asphaltic concrete according to the applicable provisions of Section 400.

533.3.04 Fabrication

General Provisions 101 through 150.

533.3.05 Construction

A. Method A Waterproofing

Use the following guidelines when waterproofing by Method A:

1. Observe Weather Conditions
Do not perform the work when the relative humidity is above 80 percent or when rain is imminent.

Prime surfaces and place membrane only when the air and concrete surface temperatures are above 50 °F (10 °C) and the surface is thoroughly dry.

2. Prime the Surface

Prime the surface as follows:

- a. Ensure that the concrete decks are at least 14 days old before applying prime and membrane.
- b. Prime and cure all areas that will receive membrane according to the manufacturer's recommendation or as directed by the Engineer.

3. Place the Waterproofing Membrane

Place the waterproofing membrane as follows:

- a. Unless otherwise designated on the Plans, extend the waterproofing membrane at least 6 in (150 mm) up the faces of the curbs, parapets, and barriers in the transverse direction and to the outer limits of the approach slabs in the longitudinal direction.
 - b. Apply the membrane to the deck surface using either hand methods or mechanical applicators.
 - c. Apply the membrane to the concrete deck so that it forms a butt joint with the faces of open joints and at expansion devices and other joints.
 - d. Seal the edges of the membrane and the drain openings to prevent water from passing between the waterproofing and the surface it covers.
 - e. Install preformed sheet membrane in a shingled pattern so that water can drain to the low areas of the deck without accumulating against seams. Follow these steps to install the membrane:
 - 1) Roll the preformed sheet membrane into place with a lawn-type roller to minimize air bubbles and to ensure that the membrane bonds with the primed surface and bonds at the overlaps.
 - 2) Overlap each strip of preformed sheet membrane at least 4 in (100 mm).
 - 3) Place the membrane so that end laps are in the direction of the paving operation.
 - 4) When the Plans indicate to place the waterproofing membrane continuously across any joint, prepare the joints as described in Section 533.3.03.B.1.
 - f. Eliminate air bubbles by puncturing the membrane and forcing the air out.
 - g. Repair these holes and other ruptures as recommended by the manufacturer. Extend patches at least 6 in (150 mm) beyond the defect.
 - h. Completely open all drain holes in the deck before paving over them.
- ### 4. Place the Pavement
- Place the pavement as follows:
- a. Do not allow construction traffic over the waterproofing membrane before placing the surface pavement.
 - b. Apply the paving over the membrane.
 - c. Completely open drain holes in the deck after placing the pavement course.

B. Method B Waterproofing

After the asphaltic concrete is compacted and water used in the compaction process has dried completely, place waterproofing membrane directly on the asphaltic concrete using the methods specified in Method A Waterproofing with the following exception:

The tack coat or primer is not required on the asphaltic concrete beneath the waterproofing membrane.

C. Method A and Method B Applying Bituminous Overlay

The paving operation and asphaltic concrete temperatures shall comply with the membrane manufacturer's recommendations and the applicable asphalt concrete pavement Specifications, or be as directed by the Engineer.

Only vehicles necessary for the overlay or paving operations shall be on the membrane.

Section 533-Bridge Deck Waterproofing Membrane

The Contractor shall be responsible for maintaining the condition of the waterproofing membrane until it is covered with pavement.

Apply bituminous overlay in either Method A or Method B as follows:

1. Before placing the overlay and if required, apply a bond coat of adhesive (bituminous tack coat) to the surface of the waterproofing membrane according to the membrane manufacturer's recommendations.
2. Overlay the waterproofing membrane with the thickness or quantity and the type of asphaltic concrete specified on the Plans.
Bituminous overlay application shall begin as soon as possible after the membrane and, if required, after the bond coat are placed.
3. Dump the asphalt concrete directly into the receiving hopper of the paving machine.
4. Have the truck pull forward and avoid contacting the paving machine while it is moving.
5. Do not permit the mixture to be dumped onto the deck ahead of the paving machine.
6. Spread and roll the asphalt concrete so that the membrane will not be damaged. Roll the first asphalt concrete lift with a breakdown roller as soon as possible after the paving machine has passed. Do not permit the use of vibratory rollers with the vibrator on.
7. Since a minimum percent compaction is not specified, compact the asphaltic concrete to the satisfaction of the Engineer and applicable compaction requirements in Subsection 400.3.06.C.
8. Place a final surface course of Open Graded Surface Mixture according to Subsection 828.2.01, "Open Graded Surface Mixtures" in the amount specified on the Plans unless otherwise specified.

533.3.06 Quality Acceptance

General Provisions 101 through 150.

533.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

533.4 Measurement

Bridge deck waterproofing membrane, complete in place and accepted, will be measured by the number of square yards (meters) of bridge deck and approach slabs covered. Material placed on curb faces and overlaps will not be measured.

Tack coat and asphaltic concrete will be measured and paid for as provided under the respective Items of Section 400 and Section 413.

533.4.01 Limits

General Provisions 101 through 150.

533.5 Payment

Bridge deck waterproofing membrane will be paid for at the Contract Unit Price per square yards (meters) for preparing the surfaces and for furnishing and applying the waterproofing system.

Payment will be made under:

Item No. 533	Bridge deck waterproofing membrane (method____)	Per square yard (meter)
--------------	---	-------------------------

533.5.01 Adjustments

General Provisions 101 through 150.

Section 534—Pedestrian Overpass Bridge

534.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 535—Painting Structures

535.1 General Description

This work consists of painting new and existing steel structures, steel H-piling and metal shell piling, and steel swaybracing. The work includes applying special protective coatings to piling and swaybracing, complete in place. The work also includes protecting traffic and property.

535.1.01 Definitions

EPA: Environmental Protection Agency

OSHA: Occupational Safety and Health Administration

PCCP: Painting Contractor Certification Program

QP1: SSPC Contractor Certification program evaluates contractors who perform surface preparation and industrial coating application on steel structures in the field.

QP2: SSPC Contractor Certification program evaluates the contractor's ability to perform industrial hazardous paint removal in a field operation. Two QP 2 categories are available based on the type of equipment and containment

- Category A - Negative Air Containment
- Category B - No Negative Air Containment

SSPC: The Society for Protective Coatings

OSHA Standards 29 CFR 1910 and 29 CFR 1926

EPA “Uniform Hazardous Waste Manifest”

EPA Method 1311, "Toxicity Characteristics Leaching Procedure (TCLP)"

535.1.03 Submittals

Provide evidence to the Department prior to beginning The Work that any Contractor or Subcontractor that performs surface preparation or coating application is currently QP1 certified by the Society for Protective Coatings (SSPC).

Provide evidence to the Department prior to beginning The Work that any Contractor or Subcontractor performing cleaning, rehabilitation, and painting work on bridge components coated with lead based paint or paint containing hazardous material is currently QP2, Category "A" certified by the Society for Protective Coatings (SSPC).

At the Preconstruction Conference or at least four (4) weeks before mobilization, make the following submittals to the Engineer for acceptance as appropriate:

A. Health and Safety Responsibilities

Provide effective engineering and work practice controls to protect employee health and safety.

1. Comply with all relevant Environmental Protection Agency (EPA), Resource Conservation and Recovery Act (RCRA), Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), Occupational Safety and Health Act (OSHA), and Environmental Protection Division (EPD) Regulations.
2. Certify to the Engineer that personnel involved with lead paint removal operations (including rigging and material handling personnel) have received training and understand the applicable parts of the latest edition of OSHA Standards 29 CFR 1910 and 29 CFR 1926, including any amendments. Have the certification signed by all personnel involved with lead paint removal.
3. Provide test results from an OSHA Certified Laboratory showing blood lead levels of employees that may be exposed to lead during the Project.
4. Provide a medical monitoring schedule to verify acceptable blood lead levels during the Project and after the Project is completed.

B. Blast Cleaning Containment System

1. Before beginning work at each bridge, submit design and drawings of the proposed containment system to the Engineer for review and approval. Include tarpaulin data sheets to verify that the material is airtight, and tightly secured at the seams. Do not use burlap or open weave materials.
2. When the proposed containment system will induce large loads on the existing structure, the Engineer may direct the Contractor to submit an analysis of the load that will be added to the existing structure by the containment system and blast waste. Have a licensed Professional Engineer registered in the State of Georgia with bridge experience perform and stamp the load analysis. Ensure that the analysis shows that the system will not induce a load on the bridge that overstresses it or affects the structural integrity of the bridge.
3. Do not allow the containment system or equipment to violate the minimum bridge clearances shown on the Plans, unless otherwise approved by the Engineer.

C. Emergency Contingency Plan

Submit to the Engineer for review and approval an emergency contingency plan for cleaning up spills from failure of the containment system, spent material recovery system, or storage containers. Define procedures for spills or releases of waste and indicate the training of workers handling the waste as required by RCRA.

D. Spent Material Sampling Plan

Submit in writing to the Engineer for review and approval the proposed method for collecting the spent material. Include a sampling plan that conforms to EPA SW849 or a statement of intent to use the DOT sampling plan ([Subsection 535.3.03.B.9](#)). This submittal will also include the name of the company (ies) and responsible person(s) that will sample, treat, and haul the spent material.

E. Material Safety Data Sheets

Submit Material Safety Data Sheets on the abrasive and paint materials that will be used.

F. Hazardous Waste Transporter Information

Provide the name and EPA identification number of each licensed Transporter used for shipping hazardous waste to a treatment, storage, or disposal facility.

G. Permitted Site Information

Provide the name and EPA identification number, phone number, and address for each permitted off-site treatment, storage, or disposal facility to which the waste will be shipped.

H. Accredited Laboratory Information

Provide the name of the Environmental Lead Laboratory Accreditation Program (ELLAP) accredited laboratory that will perform the TCLP tests.

I. Quality Control (QC) Program

Submit a written QC Program that identifies the following:

1. Instrumentation that will be used
2. Schedule of required measurements and observations
3. Procedures for correcting unacceptable work
4. Procedures for improving surface preparation and painting quality as a result of quality control findings
5. Names, qualifications, experience, and training of personnel who will be managing and implementing the QC program and conducting quality control tests

Include the GA DOT Quality Control Daily Report form as supplied by the Engineer.

Include SSPC Painting Contractor Certification Program (PCCP) certifications

The Engineer will forward a copy of these submittals to the [Office of Materials](#) for review.

535.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Abrasives for Blast Cleaning	Note 1*
Paint	870
<p>Note 1*</p> <p>Use low dusting mineral abrasives which contain a minimum of ten percent (10%) by weight G-80 steel grit blended homogeneously throughout the blasting abrasive or 100% steel grit. Alternate abrasive mixtures proposed by the Contractor require approval by the Office of Materials before use. Abrasives shall contain no more than 100 ppm of any corrosive compound such as sulfate or chloride. Abrasives shall not contain EPA characteristic compounds such as lead, chromium, or arsenic which can be detected by the EPA Toxicity Characteristic Leaching Procedure (TCLP). The mineral abrasive used to blend with steel grit will be listed in the Department's Qualified Products Manual.</p>	

535.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

535.3 Construction Requirements

535.3.01 Personnel

A. Contractor Certification

Provide the Engineer with documentation to ensure that all Contractors or Subcontractors that perform surface preparation or coating application are currently certified by the Society for Protective Coatings (SSPC) to the requirements of SSPC QP-1.

Provide the Engineer with documentation to ensure that all Contractors or Subcontractors that perform removal or disturbance of paint containing lead or other hazardous material are currently certified to the requirements of SSPC QP-2, Category A.

The painting Contractors and painting Subcontractors must remain so certified for the duration of the project. If a Contractor's or Subcontractor's certification expires, the company will not be allowed to perform any work until the certification is reissued. Notify the Engineer of any change in Contractor certification status, including certification expiration or certification renewal. Requests for extension of time for any delay to the completion of the project due to an inactive certification will not be considered and liquidated damages will apply.

535.3.02 Equipment

A. Brushes

Preferably, use brushes with round or oval cross sections. If using flat brushes, ensure that the maximum width is 4 in (100 mm).

For surfaces inaccessible to brushes, apply paint with sheepskin daubers made for painting.

Application of inorganic zinc by brush is prohibited except for small areas and touch up work.

B. Spray Equipment

If spraying paint, use air, cold airless, or hot circulating airless equipment. Spray equipment is subject to the Engineer's approval.

Use spray equipment that can constantly agitate the paint. Also, use equipment with a device that thoroughly mixes paints in their shipping containers before the paints are removed.

Water traps are required as follows:

- When using air spray equipment, ensure that the air lines in the system have suitable water traps.
- For cold airless spray equipment, water traps are not required in the air lines; use them if desired.

C. Rollers

Rollers are subject to the Engineer's approval.

Use rollers suitable to the type of paint applied and the work areas involved. Provide pans for dipping the rollers into the paint.

Follow these restrictions:

- Do not use worn rollers.
- Do not use rollers to apply special protective coatings or paints to piling and swaybracing.
- If a surface is inaccessible to rollers, apply the paint with sheepskin daubers made for painting.

D. Inspection Equipment

Ensure that the system applicator has the following:

- Wet-film gauge

- Dry-film gauge
- Surface thermometer
- Sling psychrometer
- Abrasive blasting finish gauge

During and after field cleaning and painting, furnish a safety belt and a lift truck, bucket truck, or snooper truck to the Engineer's satisfaction to inspect the cleaning and painting operation.

E. Protection Equipment

Furnish signs, warning lights, barricades, enclosures, and watchmen as required by the Manual on Uniform Traffic Control Devices or by the Engineer.

535.3.03 Preparation

Refer to Subsection 535.3.05B.1, "Weather Conditions" before performing any cleaning operations.

A. Clean New Steel Structures

Before painting, clean new steel structures as follows:

1. Clean steel H-piling, metal shell piling, and steel swaybracing.
2. Field blast clean steel H-piling, metal shell piling, and steel swaybracing that will receive paints systems or special protective coatings by field blasting. The extent of cleaning shall be SSPC-SP6, "Commercial Blast Cleaning."
3. Thoroughly shop clean the following structural steel metal surfaces to be painted. The extent of cleaning shall be SSPC-SP6, "Commercial Blast Cleaning."
4. Clean field weld or bolted connection surfaces as follows:
 - a. Before cleaning the steel, straighten bent metal according to Subsection 501.3.05.A, "Straightening Material."
 - b. Before welding or bolting, field clean the surfaces that will touch after the welding or bolting as described in Subsection 535.3.03.A, "Clean New Steel Structures," step 1 and step 2.
 - c. Keep the surfaces free of paint and metal spatters.
 - d. Field clean the remainder of the structural steel.
If desired, delay cleaning the rest of the structural steel until concrete work is complete and the main painting operation is ready to begin.
5. Prepare new steel structure surfaces for painting as follows:
 - a. Have the Engineer inspect each span or unit of work.
 - b. Do not begin painting until the Engineer approves the spans or units of work.

B. Clean Existing Steel Structures

Ensure that no work is performed before a Project Bridge Painting /Repainting Pre-Construction Conference is held.

Clean only as much metal as can be painted before it rusts. If surfaces rust after cleaning, clean them again before painting them.

Blast clean existing steel structures as follows:

1. Construct protection devices. Assume responsibility for damages to vehicles, persons, or property caused by cleaning operations.

Protect the following from blast-cleaning hazards:

- Portions of the structure (superstructure, substructure, and highway appurtenances) that could be damaged by the blast cleaning
- Existing pedestrian, vehicular, and other traffic on, underneath, or adjacent to the structure

Construct protection devices as follows:

- a. Cover or shield portions of the structure that could be damaged.
 - b. Construct a system that protects traffic from direct blasting and prevents abrasive materials and debris from spreading and creating a traffic hazard.
 - c. If blast cleaning disrupts traffic flow, stop cleaning or clean behind screens.
 - d. If the protection devices are not providing protection, stop the work and correct the problem.
Do not begin work until effective corrections are made.
 - e. Before reopening work areas to traffic, remove abrasive material and debris deposited on the pavement, shoulders, or slope paving in the area.
2. Prepare the structures for blast cleaning as follows:
- a. If the Project Inspector requires, remove railings, nameplates, and other interfering parts from surfaces to be cleaned and painted.
 - b. Straighten bent metal.
 - c. Before blast cleaning a beam or girder, remove dust and debris from the top of the bottom flange.
3. Remove all coats of paint to clean, bare metal by blast cleaning or other approved means.
The extent of cleaning shall be SSPC-SP6, "Commercial Blast Cleaning," with an anchor pattern between 1.0 and 2.0 mils (0.025 and 0.051 mm). Anchor patterns greater than 2.0 mils (0.051 mm) will require that the primer be applied at a thickness of at least 1 mil (0.025 mm) over the anchor pattern or that the steel be re-blasted unless otherwise approved by the Engineer.
4. After blast cleaning and before painting, prepare the steel surfaces as follows:
- a. Remove sand, dust, and other foreign matter from the following:
 - Deck
 - Piers
 - Railing
 - Other adjoining parts of the structure
 - Slope paving
 - b. Remove any fins, tears, or slivers from the steel.
 - c. Remove burred or sharp edges that appear on any steel members.
 - d. Have the Engineer inspect each span or unit of work.
 - e. Do not begin painting until the Engineer approves the spans or units of work.
5. Contain the paint chips, abrasive particles, and dust or debris (spent material) caused by cleaning and blasting as follows:
- a. Contain spent material according to the SSPC GUIDE 6, Class 1. The containment materials and support structure may be flexible or rigid.
 - b. Ensure that tarpaulins are airtight and secure at the seams.
 - c. Do not use burlap or open-weave materials.
 - d. Seal seams and joints by taping or overlapping tarps at least 24 in (600 mm). Overlap the entryway at least 3 ft (1 m).
 - e. Use negative pressure and verify it as follows:
 - Verify pressure through the concave nature of the containment materials, taking into account wind effects.
 - Observe air flow using smoke or other visible means inside or outside the containment.
 - f. Filter the air exhausting from the containment with a properly sized dust collector, bag house, or other approved method.
 - g. During abrasive blasting operations, ensure that the cross-draft and downdraft air movements within the containment comply with OSHA Standard 29 CFR 1910.94.

6. Additional blast-cleaning requirements for bridges over waterways:
 - a. Ensure that there is no scum on the surface of the water outside a 200 ft (60 m) limit of the bridge. Stretch a floating boom across the waterway at or before this 200 ft (60 m) limit on the downstream and downwind sides of the bridge to contain floating spent material.
 - b. If floating residue is found outside this 200 ft (60 m) limit, the Engineer will consider protection inadequate and will require further containment measures.
 - c. If the wind velocity is high enough to blow the residue outside the 200 ft (60 m) limit, the Engineer will temporarily suspend the blast cleaning.
 - d. Provide a flotation device in the water underneath the area being blast cleaned to collect the spent material.
 - e. If the stream is too shallow for a barge, erect a temporary platform or tarp arrangement to collect the spent material.

7. Alternate Containment System

If desired, propose an alternate method for containing the dust and spent materials from blast cleaning the structural steel.

The Department may reject a proposed alternate method that does not satisfy the Department's concerns for the safe removal and containment of lead-based paint from bridge structures.

Submit the proposal for evaluation and approval as follows:

- a. Submit a detailed, written proposal describing the alternate containment and blasting method.
- b. Include in the description specific information on materials and equipment, noise levels, and worker safety and health.
- c. Supply references of other locations where the alternate method has been used.
- d. The Department will review the information submitted and may reject the proposal or issue a conditional approval.
- e. If the Department grants conditional approval, demonstrate the alternate method for containment and blast cleaning on a trial basis.
 - 1.) The Department will evaluate the effectiveness of dust and spent material containment, worker safety and health concerns, and noise levels.
 - 2.) If the Department finds the alternate method unacceptable, the Department may reject it and require work according to this Specification.
 - 3.) If the Department approves the alternate method, the Contractor will receive no additional payment above the established Contract Unit Price.

8. Handling Spent Materials

Handle spent materials according to the following requirements:

- a. Collect the spent material daily and store it in sealed waste disposal containers.
- b. Use waste containers that are approved by the Engineer and located where they will not cause a potential hazard.
- c. Store waste containers in a temporary, fenced, secured area that is not located in a storm water runoff course, in standing water, nor on Department property. Ensure compliance with the requirements of EPA 40 CFR 264.14 and 40 CFR 264.18.
- d. Label waste containers in compliance with hazardous waste laws.
- e. Have the Contractor or his/her Consultant sample the spent materials according to the approved sampling plan referenced in Subsection 535.1.03.D.
- f. Test the material using certified independent laboratory in accordance with the Toxicity Characteristic Leaching Procedure (TCLP).
- g. Collection, storage, sampling, and testing shall be performed in accordance with EPA RCRA Regulations (40 CFR 240-299).
- h. Forward a copy of all TCLP results to the Engineer and to OMR.

- i. If the TCLP toxicity test results do not classify the spent materials as a hazardous waste, uniformly blend twenty percent Portland cement with the spent materials and solidify the mixture before disposing of it at a licensed solid waste landfill. The cost of treatment and disposal of non-hazardous spent material is considered incidental to the pay item.
 - j. If the TCLP test results classify the material as a hazardous waste, treat the material to the Land Disposal Restriction standard of 0.75mg/l. The waste shall not be disposed of until authorized by the Engineer.
 - 1) If the waste is to be treated on-site, submit a waste analysis plan to the regional EPA office in accordance with 40 CFR 264.13 within 30 days of receipt of the TCLP results.
 - 2) If the waste is to be treated off-site, submit TCLP results to the EPA permitted hazardous waste treatment facility.
 - k. Forward a copy of all manifests and pertinent documents to the Engineer and to OMR.
9. Sampling for Lead Paint Residue
- a. Use the approved detailed sampling plan included in Subsection 535.1.03.D, "Spent Material Sampling Plan" which could either be the sampling plan listed below or a similar plan that conforms to *EPA SW 846, Chapter 9 Test Methods for Evaluating Solid Waste Physical/Chemical Methods*.
Ensure the plan includes the following:
 - 1.) Who will be responsible for the sampling
 - 2.) How often samples will be taken
 - 3.) How the samples will be obtained
 - 4.) Where the samples will be taken
 - 5.) How the samples will be handled
 - 6.) How the sample results will be tied back to the waste from which it was sampled.
 - b. Inform the Project Personnel and Independent Assurance Engineer as to when (date and time) the samples will be taken. The Department will monitor the sampling procedure and the Project Personnel will enter all pertinent information in a logbook. Information to be recorded is as follows:
 - 1.) Project and Contract ID numbers
 - 2.) Sampling points
 - 3.) Field contact personnel
 - 4.) Producer of waste
 - 5.) Type of process producing the waste
 - 6.) Type of waste
 - 7.) Total number of samples
 - 8.) Number of drums each sample will cover
 - 9.) Which bridge location and the drum number i.e. 1-10, 11-18 that the sample will cover.
 - a. Label all of the drums on the project. Ensure that the labels are weatherproof and include the following:
 - The Date
 - The Project Number
 - The Contract ID Number
 - The Bridge Location
 - Assign drums a series of consecutive numbers, i.e., 1-40.
 - c. Take one grab sample (using random sampling technique) from a drum for each bridge location. Use a thieving device to secure samples from each of the drums. The minimum sample size is 0.66 lb (300 g) which is about a cupful.
 - d. Samples may be taken by the paint Contractor or his/her consultant who will treat the waste.
 - 1.) Send the samples to a certified private testing lab.

- 2.) Attach a Sampling Analysis Request (sample card) to the samples which includes:
 - a) The Date
 - b) Project Number
 - c) Contract ID number
 - d) Bridge Location
 - e) Name of collector
 - f) Place of collection
 - g) Number of drums from Bridge each sample will cover, and
 - h) Drum numbers, i.e. 1-10, 11-18 that sample will cover.
- 3) Include this information on the test report and the manifest so that the waste on the manifest can be keyed to the results on the TCLP report.
- 4) Ensure that a chain of custody form accompanies the sample and is returned with the test results.
- e. Test the samples for EPA Method 1311, Toxicity Characteristic Leaching Procedure (TCLP).
- f. Test one (1) sample for each bridge location.
 - 1.) If the results are 5 mg/l or greater leachable lead, the waste is to be declared hazardous and no further testing is needed until the waste has been treated. After treatment, the waste shall be re-sampled and re-tested in accordance with an approved sampling plan and shall be below 0.75 mg/l before disposal.
 - 2.) If the results are below 5mg/l, the waste is to be declared non-hazardous, then the contractor or his/her consultant shall uniformly blend twenty percent Portland cement with the spent material and solidify the mixture before disposing of it at a licensed solid waste landfill.
- g. Additional samples must be acquired according to EPA SW 846 and SSPC-Guide 7 Section 5.6.5.
- h. Mail the Test reports and manifests to the Engineer's office, which will review them, take the appropriate action and send them to the lab files at the Office of Materials. Send an extra copy of each to the Office of Materials/Independent Assurance.

If the TCLP toxicity test results classify the spent materials as a hazardous waste, treat the waste either on-site or off-site to the Land Disposal Restriction Standard of 0.75 mg/l. Do not dispose of the waste until authorized by the Engineer. Hazardous waste material may be treated off-site if the treatment is performed by a licensed hazardous waste treatment facility in accordance with EPA and EPD guidelines. Forward a copy of all manifests and other pertinent documents to the Engineer and to OMR. These documents will be maintained in the project file for three years.

If after treatment, the spent material is classified as a hazardous waste by the TCLP test, retreat it until the Universal Treatment Standard is met. Hazardous waste disposal shall be paid for as specified under Subsection 535.5 "Payment", of this Specification.

10. Handle hazardous waste as follows:
 - a. Comply with Section 107 of the Specifications. The Contractor is responsible for complying with the hazardous waste laws when performing the Work. Obtain a separate United States Environmental Protection Agency, Generator I.D. Number for each project where the spent material is hazardous waste according to the Toxicity Characteristic Leaching Procedure (TCLP) results.
 - b. Obtain the generator I.D. number from the Georgia Environmental Protection Division, Hazardous Waste Management, (404) 656-2833.
 - c. Obtain the Generator I.D. Number within 30 days of receiving the TCLP results and provide copies of the number to the Project Engineer and the Office of Maintenance, Bridge Inspection Unit, No. 2 Capitol Square, Atlanta, Georgia 30334.
 - d. Dispose of hazardous spent material only at a licensed hazardous waste disposal facility.
 - e. If the disposal facility requires it, send a sample of spent material for confirmation testing before delivering the shipment.
 - f. Transport the waste to the facility using EPA-approved licensed waste haulers.

- g. Document each truckload of hazardous waste using an EPA “Uniform Hazardous Waste Manifest.”
- h. According to EPA and EPD rules, provide GDT and the Georgia EPD notification and certification of treated hazardous spent abrasives. Include the following:
 - Name and address of facility receiving the shipment Description of the waste as initially generated, including the applicable EPA Hazardous Waste Number(s) and treatability group(s)
 - Treatment standards applicable to the waste at the initial generation point
 - Signature of an authorized Contractor representative on the certification
- g. Hazardous waste disposal is paid for as specified under Subsection 535.4.01.A, “Spent Materials.”

C. Clean Structures Under or Over Railroads

When cleaning and painting steel structures involves work on, over, or below the railroad right-of-way or the property of a railroad company (Railroad), comply with the following:

- The additional requirements, including railroad flagging and insurance coverage, listed in the Special Provision for Protection of Railway Interests
- The Railroad’s general rules, regulations, and requirements including those on safety, fall protection, and personal protective equipment

Coordinate the work with the Railroad and ensure that there will be no interference with or delay to Railroad operations, including train, signal, and communication services.

1. Railroad Protection Requirements

The Contractor is responsible for damages to vehicles, persons, or property resulting from cleaning operations.

Ensure that the facilities and property of the Railroad or any tenants remain undamaged.

Comply with the following:

- a. Protect the following from the damages of blast-cleaning operations:
 - Traffic (pedestrian, vehicular, rail, train, and other kinds of traffic) on, under, or next to the structure
 - Portions of the structure (superstructure, substructure, and highway appurtenances) that could be damaged
- b. Weight or anchor ground cloths to withstand the suction effects of a passing train.
- c. Restrain ropes, hoses, tarps, booms, and other equipment so they do not hang from the bridge or otherwise infringe on the clearances around an active track (see Subsection 535.3.03.C.2, “Railroad Construction Clearance Limits,” below). Account for the following:
 - Wind billowing of draped tarpaulins
 - Sag from the weight of collected spent materials

2. Railroad Construction Clearance Limits

Comply with the Railroad Construction Clearance Limits:

Railroad Construction Clearance Limits		
Track Type	Horizontal Limits	Vertical Limits
Single Track	25 ft (8 m) from the center line	The existing vertical clearance from the top of the rail to the underside of the bridge
Multiple Tracks	25 ft (8 m) from the center lines of the outermost tracks	The existing vertical clearance from the top of the rail to the underside of the bridge

3. Requirements on Bridges Carrying Roadways Over Railroad Tracks

When work is required within the Railroad Construction Clearance Limits, ensure that the following can be moved outside the clearance limits when the Railroad flagman notifies you to clear the track for rail traffic.

- Working platforms

- Scaffolding
- Containment systems
- Other equipment necessary to complete the Work

While the track is open to rail traffic, do not allow ropes, hoses, tarps, booms, or other equipment or items to hang from the bridge or infringe on the clearance limits.

4. Requirements on Bridges Carrying Railroad Tracks over Roadways

When work is required on the Railroad bridge, ensure that the following can be moved completely off the bridge when the Railroad flagman notifies you to clear the track for rail traffic.

- Working platforms
- Scaffolding
- Containment systems
- Other equipment necessary to complete the Work
- Spent material

Do not attach rigging or other items to the bridge rails or barriers at the sides of the bridge.

While the track is open to rail traffic, do not allow ropes, hoses, tarps, booms, or other equipment or items to remain on the bridge.

D. Prepare Steel Piling, Swaybracing, and Concrete Piling Surfaces for Special Protective Coatings

Prepare surfaces and material for special protective coatings according to the manufacturer's recommendations. For a list of sources, see QPL 18.

535.3.04 Fabrication

General Provisions 101 through 150.

535.3.05 Construction

A. Provide Protection

Protect the structure, adjoining property, and the public from the dangers and damages of cleaning and painting.

Protect the following:

- Pedestrian, vehicular, and marine traffic on or underneath the structures being painted
- Structures
- Slope paving

Clean slope paving stained during painting to the Engineer's satisfaction.

B. Meet General Painting Requirements

Follow these requirements when painting new and existing steel structures:

Meet General Painting Requirements

Follow these requirements when painting new and existing steel structures:

1. Weather Conditions

Cleaning or Painting shall not take place during windy or gusty conditions unless the contractor can demonstrate to the satisfaction of the Engineer that containment is sufficient to prevent the escape of paint overspray or spent material. If any paint overspray or spent material is detected outside containment areas, cease all operations until clean up has been completed. Do not recommence cleaning or painting operations until additional measures have been taken to prevent any future escape of spent material and/or paint overspray.

When the Plans specify System VI (waterborne), ensure that the minimum air and surface temperature is 50 °F (10 °C). Comply with the other weather requirements listed below.

When the Plans specify System VII, ensure that the minimum air and surface temperatures are above 35 °F (2 °C) and the relative humidity is greater than 50% when applying the inorganic zinc primer. Apply System VII waterborne intermediate and top coats only when the temperatures of both the air and surface are above 50 °F (10 °C).

For Systems IV and V (alkyd), apply paint only when the air and surface temperatures are both above 40 °F (4 °C).

Weather Requirements for Painting All Systems	
Maximum surface temperature	140 °F (60 °C)
Relative humidity	Below 85%
Minimum surface temperature	5 °F (3 °C) above dew point

Follow these weather restrictions:

- Do not apply paint to surfaces that are damp or otherwise unsatisfactory as determined by the Engineer.
- Do not paint in open yards or on erected structures when the metal is hot enough to cause the paint to blister or produce a porous film.
- Do not paint metal hot enough to cause oil separation in the alkyd paint.
- Do not paint metal when freezing weather 32 °F (0 °C) is forecast or expected before the paint can dry.
- Do not store at temperatures below 32 °F (0 °C) or above 100 °F (38 °C). When outdoor temperatures exceed these limits, paint shall be stored in an appropriate indoor location.

2. Oxidation

If a prime coat on structural steel fades or chalks because of oxidation, thoroughly remove the oxidation by brushing or by washing with water until the sound prime coat is visible.

3. Paint Thinning

Do not thin or dilute paints.

4. Application Methods

Thoroughly mix paints in their shipping containers using mechanical devices before removing the paint.

For inorganic zinc primers, add the powder component to the liquid component with thorough stirring, and continue stirring until the powder is well dispersed. Strain the mixture through a 30-60 mesh sieve to remove large particles. Use pressure pots equipped with a mechanical agitator, which will remain in motion throughout the application.

Ensure that the paint formulation matches the application method (brush, roller, airless spray, or air spray).

Apply paint neatly by brushing, spraying, or rolling. Use rollers only as specified in Subsection 535.3.02.C, "Rollers."

When using brushes or rollers, apply the paint as follows:

- a. Produce an even coating covering the metal or the previous coat.
- b. Work the paint into corners and crevices.
- c. Keep enough paint on rollers and overlap the applications to avoid unsightly or mottled areas.

Use the paint numbers shown in the Table of Application Methods, below.

Table of Application Methods			
Brush	Roller	Airless Spray Hydraulic	Air Spray
Ordinary Exposure Green System IV (Lead Free Alkyd)			
1A	1A	1A	X
1A	1A	1A	X

Table of Application Methods			
Brush	Roller	Airless Spray Hydraulic	Air Spray
2A	2A	2A	X
3B	3B	3B	X
X	X	X	X
Heavy Exposure Green System V (Lead Free Alkyd)			
1A	1A	1A	X
1A	1A	1A	X
1A	1A	1A	X
2A	2A	2A	X
3B	3B	3B	X
Ordinary Exposure Green System VI (Waterborne)			
1W	1W	1W	1W
1W	1W	1W	1W
2W	2W	2W	2W
3W	3W	3W	3W
Ordinary exposure Green System VII (Zinc Primer)			
X	X	Inorganic Zinc Primer	X
2W	2W	2W	2W
3W	3W	3W	3W

5. Paint Systems and Dry Film Thickness

Apply the minimum required dry film thickness and the additional coats according to the paint system required on the Plans.

Table of Paint Systems and Minimum Required Dry Film Thickness		
No. of Coats	Color of Coats	Thickness, mils (mm)
Ordinary Exposure Green System IV (Lead Free Alkyd)		
Primer	Red	2.0 (0.051) to 5.0 (0.127)
Touch-Up	Red	*
2nd Coat	Buff	2.0 (0.051) to 5.0 (0.127)
3rd Coat	Green	1.0 (0.025) to 3.0 (0.076)
4th Coat	None	X
Heavy Exposure Green System V (Lead Free Alkyd)		
Primer	Red(T)	2.0 (0.051) to 5.0 (0.127)
Touch-Up	Red	*
2nd Coat	Red	2.0 (0.051) to 5.0 (0.127)
3rd Coat	Buff	1.5 (0.038) to 5.0 (0.127)

Table of Paint Systems and Minimum Required Dry Film Thickness		
No. of Coats	Color of Coats	Thickness, mils (mm)
4th Coat	Green	1.0 (0.025) to 3.0 (0.076)
Ordinary Exposure Green System VI (Waterborne)		
Primer	Brown	3.0 (0.076) to 5.0 (0.127)
Touch-Up	Brown	*
2nd Coat	Buff or White	3.0 (0.076) to 5.0 (0.127)
3rd Coat	Green	3.0 (0.076) to 5.0 (0.127)
4th Coat	None	X
Ordinary Exposure Green System VII (Zinc Primer)		
Primer	Gray	3.0 (0.076) to 5.0 (0.127)
2nd Coat	Buff or White	2.0 (.051) to 5.0 (0.127)
3rd Coat	Green	2.0 (0.051) to 5.0 (0.127)
4th Coat	None	X
* = 2.0 (0.051) for touch-up coats (T) = Tinted		

6. Proper Drying

Ensure that each coat is thoroughly dry and cured before applying the next coat. Allow at least 24 hours between coats.

If weather conditions and paint type require, allow longer periods between coats.

7. Cracks and Cavities

Before applying the second field coat, fill small cracks and cavities that are not sealed watertight by the first field coat using the following

Plan-Required Paint System	Fill Mixture
IV or V	Pasty mixture of zinc hydroxy phosphite and linseed oil
VI	Pasty mixture recommended and supplied by the manufacturer
VII	Pasty mixture recommended and supplied by the manufacturer

C. Paint New Steel Structures

Paint new steel structures as follows:

1. Use the correct paint system. The Plans usually specify one of the systems shown in the Table of Paint Systems and Minimum Required Dry Film Thickness. If the Plans do not specify a paint system, use System VI.

If the structure is located in the 13 county ozone non-attainment region, use only Waterborne coatings for any painting operation conducted between May 1 and September 30. The 13 metro Atlanta counties that comprise the non-attainment region are: Cherokee, Clayton, Cobb, Coweta, DeKalb, Douglas, Fayette, Forsyth, Fulton, Gwinnett, Henry, Paulding, and Rockdale. Do not apply Alkyd coatings and the System VII inorganic zinc primer under the above conditions. System VI and the System VII waterborne intermediate and top coats may be applied.

2. Paint new structural metal with one shop prime coat, one field touch-up coat, and two field weather coats. When severe exposure conditions require, apply one additional prime coat. Once painting has commenced, (including shop coat) succeeding coats of paint are to be the same paint system and from the same paint manufacturer.

3. Apply the type and color of paint coats as required by the system number shown on the Plans.
If succeeding coats are the same type and color, tint one of the underlying coats as required by Subsection 870.2.01.B.1.d and Subsection 870.2.06.A.6.
4. Do not paint advertising on structural steel.
5. Adhere to the following requirements for special surfaces:
 - a. Concrete Contact Areas
If the following surfaces will touch previously poured and hardened concrete, apply two coats of primer to them:
 - Steel surfaces
 - Nongalvanized handrail posts
 - Nonembedded armored jointsUnless otherwise specified on the Shop Drawings, do not shop paint surfaces that will touch plastic concrete.
 - b. Inaccessible Areas
Before assembly, paint surfaces that will be inaccessible after assembly or installation with two coats of primer.
 - c. Connection Areas
Do not shop paint the following connection areas:
 - Surfaces that will touch after welding or bolting
 - Areas next to field welds
 - d. Machine-Finished Surfaces
Using the materials specified, either shop paint or coat the machine-finished surfaces according to Subsection 501.3.04.D.9, "Coating Machine-Finished Steel Surfaces."
 - e. Plates That Touch Elastomeric Pads
Apply one coat of the shop primer specified on the Plans to plates that will touch elastomeric bearing pads.
 - 1.) Paint surfaces and edges that will be exposed after components are erected.
 - 2.) Do not apply the primer paint to areas that will be welded.
 - 3.) Do not apply the primer paint to the area that will bear against the elastomeric pad.
 - 4.) Dimension and locate the blocked-out, no-paint areas to within plus or minus 1/2 in (13 mm) of the theoretical location and size of the elastomeric pad.
6. Do not handle or load steel until the shop paint is dry.
7. Field paint steel surfaces according to this time line:
 - a. Before Erection
If the following surfaces will touch previously poured and hardened concrete, touch them up as required with primer (or apply two coats of primer if the item was not shop painted) before installing them:
 - Steel surfaces
 - Nongalvanized handrail posts
 - Nonembedded armored jointsDo not install until the paint is thoroughly dry.
 - b. After Erection
After completing steel erection, clean unprimed surfaces of connection areas requiring paint as specified in Subsection 535.3.03.A, "Clean New Steel Structures," step 3.
Connection areas include welded or bolted splices, beam and diaphragm connections, and bracing connections.
Prime connection areas with the paint specified in the system number shown on the Plans.
Do not prime welded connections until the following occurs:
 - Weld metal is cleaned according to Subsection 501.3.04.I.2, "Paragraph 3.10.1," and Subsection 501.3.04.I.3, "Paragraph 4.30.1."

- Radiographic or magnetic particle inspection work, if specified, is complete and the welds are approved.
- c. After Concreting
- After completing concreting work, clean surfaces as specified in Subsection 535.3.03.A, “Clean New Steel Structures,” and field paint as follows:
- 1.) Cover the following with one coat of touch-up primer paint and allow it to dry:
 - Shipping and erection marks
 - Bolt heads
 - Other surfaces with worn off or defective prime coat
 - 2.) During touch up, stripe or paint the following with an additional coat of primer:
 - Exposed edges of flanges on rolled beams and built-up girders
 - Edges of angles and stiffeners
 - Exposed edges of gusset plates, splice plates, and cover plates
 - 3.) Ensure that sharp, exposed edges have two full coats of primer paint, including the shop coat.
 - 4.) If removing oxidation as described in Subsection 535.3.05.B.2, “Oxidation,” damages the prime coat so that bare metal is exposed after cleaning, prime the exposed bare metal with an additional coat at no expense to the Department.
 - 5.) If removing oxidation reduces the prime thickness, use two field weather coats, if desired, to obtain the total thickness required for the paint system.
However, when the two field weather coats are different types of paint, use additional prime paint to obtain the prime thickness.

D. Paint Existing Steel Structures

Paint existing steel structures as follows:

1. Prevent paint overspray by using containments.
2. The weather conditions specified for new steel structures described in Subsection 535.3.05.B also apply to existing steel structures.
3. Apply the correct colors and number of coats as follows:
Only steel which has undergone complete removal of all coats and which has a surface cleanliness conforming to SSPC SP-6 may be coated with System VI.
Give this steel one full prime coat and two weather coats, all of the color and type required by the Special Provisions or Plans. If succeeding coats are of the same type and color, tint one of the underlying coats-as required by the Specifications.
4. The drying requirements of Subsection 535.3.05.B.6 specified for new steel structures shall apply to existing steel structures.
5. The paint thinning requirements of Subsection 535.3.05.B.3 specified for new steel structures shall apply to existing steel structures.
6. Painting Of Surfaces:
 - a. Methods Of Application: The requirements of Subsection 535.3.05.B.4.as specified for new steel structures shall apply to existing steel structures.
 - b. Cracks And Cavities: The requirements of Subsection 535.3.05.B.7 as specified for new steel structures shall apply to existing steel structures.
 - c. Paint Thickness: The minimum required dry film thickness as specified in Subsection 535.3.05.B.5 and the additional coats specified in Subsection 535.3.05.B.5 for new steel structures shall apply to existing steel structures. However, when new paint is applied over existing sound paint, the required wet film thickness of the new coats shall be that required by the Special Provisions or Plans.

7. Apply the minimum required dry film thickness and the additional coats specified in the Table of Paint Systems and Minimum Required Dry Film Thickness.
However, when applying new paint over existing sound paint, comply with the required wet film thickness specified by the Special Provisions or Plans for new coats.
8. After completing the painting, replace the railings, name plates, and other interfering parts removed (as described in Subsection 535.3.03.B, "Clean Existing Steel Structures" step 2.a) to the Engineer's satisfaction.

E. Paint Steel H-Piling, Metal Shell Piling, and Steel Swaybracing

Paint this material as follows:

1. Weather Conditions

Except as specified below, apply paint in the weather conditions specified in Subsection 535.3.05.B.1, "Weather Conditions."

- a. Painting in open yards or on erected structures shall not be done when the metal is sufficiently hot to cause the paint to blister or produce a porous film.
- b. Metal shall not be painted when freezing weather [32 °F (0 °C)] is forecast or expected in the time that would occur before the paint has dried.

2. Thinning Paint

Do not thin or dilute pile paints.

3. Number of Coats and Color

Unless the Plans require a No. 1P or 2P system, described in Subsection 870.2.05.A.1, "Paint for Steel Piling and Swaybracing," paint steel H-piling, metal shell piling, and steel swaybracing with a System VII paint system.

Apply a No. 1P system as follows:

- a. When using a No. 1P system formulated as a first application primer and a separate finish coat, ensure that containers are clearly labeled as primer or finish coat.
- b. Apply the primer first.
- c. Apply successive coats using either primer or finish coat.
- d. Ensure that the final coat is a finish coat

4. Method of Application

Apply the black paints noted in Subsection 535.3.05.E.3, "Number of Coats and Color" using either brushes or sprayers.

When using a brush, apply the paint as follows:

- a. Apply a thick application of paint to be plastered or troweled on the steel surfaces.
- b. Brush out the paint only as required to obtain uniform thickness; do not attempt to brush it out neatly.
- c. Work the paint into corners and crevices.

5. Application Rate

For each coat, apply at least 1 gal of paint type per 60 ft². (0.7 L/m²). Ensure that the total dry-film thickness of paint coats is as specified in Subsection 535.3.05.E.6, "Thickness of Paint," below.

6. Thickness of Paint

Ensure that the final, dry-film thickness of the completed work is at least 25 mils (0.635 mm).

Apply additional coats to achieve the minimum dry-film thickness at no expense to the Department.

7. Extent of Paint

Paint to the following extent:

- Coat exposed piling with a System VII paint system unless a No. 1P or No. 2P system is specified on the Plans.
- Coat piling in the stream bed and within 10 ft (3 m) of the top of the stream bank with the System VII from 5 ft (1.5 m) below the stream bed to the bottom of the concrete cap.

- Coat end bent piles 2 ft (600 mm) below the bottom of the cap or concrete encased as defined in Subsection 520.3.05.O, “Coat and Paint Piling.”
- For piling that will be encased according to Section 547, paint the piling with System VII to the extent specified in Subsection 520.3.05.O, “Coat and Paint Piling.”
- Before driving, coat test piles located in permanent surface water with a System VII according to Subsection 520.3.05.O, “Coat and Paint Piling.”

Paint enough of the test pile to ensure that the coated portion extends 5 ft (1.5 m) below the stream bed or bottom.

8. Drying Requirements

Ensure that each coat is thoroughly dry before the next coat is applied.

F. Apply Special Protective Coatings to Steel Piling, Steel Swaybracing, and Concrete Piling

Unless the Plans require No. 1P or 2P system, apply a System VII coating. Apply the coating to the extent specified in Subsection 520.3.05.O, “Coat and Paint Piling.”

Ensure that coverage, wet- and dry-film thicknesses, temperature considerations, primer use, and drying and curing time comply with the manufacturer’s recommendations.

Apply the special protective coating as follows:

1. When the structure will be welded, do not apply the material until the weld is placed and cleaned.
2. Apply the material in at least two coats by brushing.
3. Apply the second coat at right angles to the first coat.
4. Use the elapsed time between coats recommended by the manufacturer.
5. Ensure that the finished film has no holidays and pinholes and completely covers the underlying surface.
6. After applying the coating material, recoat damaged areas where the protection is ineffective as determined by the Engineer.
7. Where swaybracing members will be welded to piles and painted in advance, burn off the coating at the weld location and proceed as follows:
 - a. Thoroughly clean the burned area by scraping and power-operated wire brushing before welding.
 - b. After making and cleaning the weld, recoat the area.
8. Do not drive piles painted in advance until the second coat has thoroughly dried and completely cured.

535.3.06 Quality Acceptance

A. Correct Defective Work

If applied paint does not meet the requirements of this Specification, remove the paint or correct it using SSPC-approved means.

Remove paint that is applied to improperly cleaned surfaces. Clean the surfaces and repaint them to the Engineer’s satisfaction.

B. Meet the Required Total Dry-Film Thickness

If the minimum required total dry-film thickness specified for the paint system is not reached after applying the required number of coats and colors, apply additional coats at no expense to the Department until the required thickness is obtained.

The Department considers the applied zinc primer deficient in thickness for measured dry thickness values less than 3 mils (0.076 mm). If more than four deficient thickness values (one measurement per 25 ft.² (2.32 m²) of surface area) are found in any 200 ft² (18.6 m²) of continuous metal section, blast clean the entire section to a SSPC-SP6, Commercial Blast condition. Repaint the section with inorganic primer to achieve a dry film coating thickness of 3.0 to 5.0 mils (0.076 to 0.127 mm).

Repair primed areas having excessive dry film coating thickness, coating "dry spray", visible coating "mudcracking", visible surface hackles, handling abrasions, and missed paint in bolt holes. Repair in accordance with the written recommendations of the paint manufacturer. Obtain the Engineer's approval for all repair recommendations. Include current product data and application instruction sheets with the repair recommendations.

535.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

535.4 Measurement

The cost of painting new steel structures shall be included in the Contract Price for structural steel. No separate payment will be made.

Cleaning and painting existing steel bridge structures will be measured and paid for at the Contract Unit Price for "Painting Existing Steel Structure Station or Bridge I.D. No. ____." This includes payment for the following:

- Equipment (including a "flotation device" or temporary platform on waterway bridges)
- Work platform
- Bucket truck or snooper truck with safety belt
- TCLP testing
- Materials and work necessary to remove lead-based paint and contain the spent materials
- Collection and storage of spent materials, water, and slurry generated by abrasive blasting

535.4.01 Limits

A. Spent Materials

Treatment of hazardous waste and subsequent disposal shall be paid for under a force account basis. The Engineer will reimburse the Contractor based upon invoices from the licensed hauler and disposal facility. An additional amount equal to 3% of the total invoices will be paid as administrative costs incurred by the Contractor.

The costs of collecting spent material, furnishing the containers, loading the material into containers, treating the material onsite, and loading the containers into the licensed hauling unit will not be paid for separately. These costs are considered incidental to the pay item.

The disposal of other spent materials collected is incidental to the Pay Item "Painting Existing Steel Structures."

B. Piling and Steel Swaybracing

The cost of applying special protective coatings or paint to piling shall be included in the Contract Price for piling. No separate payment will be made.

The cost of applying special protective coatings or paint to steel swaybracing shall be included in the Contract Price for structural steel. No separate payment will be made.

535.5 Payment

Payment is full compensation for the costs, direct and indirect, of complying with the requirements of this Specification.

Payment will be made under:

Item No. 535	Painting existing steel structure, Station No. ____	Per lump sum
Item No. 535	Painting existing steel structure, Bridge I.D. No. ____	Per lump sum
Item No. 535	Painting existing steel structures, Railroad Special, Station No. _____	Per lump sum
Item No. 535	Painting existing steel structures, Railroad Special, Bridge I.D. No. _____	Per lump sum

535.5.01 Adjustments

General Provisions 101 through 150.

Section 537—Cattle Pass

537.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 538—Post-tensioned Prestressed Concrete Construction

538.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 539—Inspection Traveler

539.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 540—Removal of Existing Bridge

540.1 General Description

This work consists of removing and disposing of or salvaging as specified in Subsection 540.3.05.C, “Disposal and Ownership of Material” all or parts of an existing bridge for the Department’s further disposition.

The work includes, but is not limited to, the following:

- Removing all or part of the superstructure or the substructure as described in Subsection 540.3.05.A, “Extent of Removal.”
- Excavating to remove the structure unless the excavation is required as a part of another Pay Item.
- Necessary backfilling because of the removal or excavation.

Parts of the structure removed will not be included in the measurements for any excavation to be paid under another Pay Item.

540.3.03 Preparation

A. Sequence of Operations

No existing structure shall be removed or closed to traffic until traffic has been satisfactorily provided for as required by the Plans or the Engineer.

No burial will be allowed under any conditions in areas designated by the Department as wetlands.

540.3.04 Fabrication

General Provisions 101 through 150.

540.3.05 Construction

A. Extent of Removal

Where culverts will replace an existing bridge, remove portions of the existing bridge, including piling, within the area of the proposed culvert to a minimum depth of 5 ft (1.5 m) below the flow line of the culvert.

Otherwise, do the following:

- Remove the superstructures, or parts of them, as shown on the Plans.
- Remove the entire substructure down to the streambed or the natural ground line unless the Plans require that old substructures or parts of them be used as permanent parts of the new structure.
- Remove the parts of the substructure that interfere with the new work. Do not leave parts within the limits of an excavation required as part of another Pay Item.
- Remove fender systems and dolphins to the streambed.
- Leave abutments or end bents in place that do not interfere with the stream flow or the new work if the Plans indicate.
- If the abutments or end bents must be removed, remove them and slope the existing fill immediately next to them in an attractive manner as determined by the Engineer.

B. Care in Removal

Use only approved methods to remove an existing bridge and be careful during blasting to prevent property damage or injury.

1. Reuse of Existing Structures

Handle existing structures being reused as follows:

- a. If part of a separate unit of an existing structure will be incorporated into the new structure, remove the part from that unit without blasting.
- b. If the Plans provide for reusing existing reinforcement, clean, straighten, or bend reinforcement to the required dimensions and cut it as an incidental part of this work.
- c. When existing structures will remain as part of a widened structure, neatly remove parts from the structures. Leave the face of the joint essentially true to the line and plane indicated on the Plans.

2. Salvageable Material

Handle salvageable material as follows:

- a. Determine from the Plans the parts, if any, to be salvaged for the Department's further disposition.
- b. Arrange the salvaging method accordingly.
The Contractor shall be responsible for damage to salvageable materials because of carelessness and shall replace or compensate the Department for damaged salvageable materials.
- c. When a wrecking ball is used, have no blows struck within 24 in (600 mm) of the edge of any member to be salvaged for the Department.

C. Disposal and Ownership of Material

Dispose of material as follows:

- 1. Salvage only the material designated on the Plans for salvage.
- 2. Disassemble this material and neatly stockpile it near the bridge site and above high water.
- 3. Do not use any materials stockpiled for the Department without written permission from the Engineer.

All other materials removed shall become the property of the Contractor, who shall remove them from the bridge site or, if permitted, bury them neatly within the right-of-way, all without additional compensation.

Dispose of the above materials according to Subsection 201.3.05.E, "Removal and Disposal of Materials."

540.3.06 Quality Acceptance

General Provisions 101 through 150.

540.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

540.4 Measurement

This work will not be measured separately for payment

540.4.01 Limits

General Provisions 101 through 150.

540.5 Payment

This work will be paid for at the Contract Price per Lump Sum, which will be full compensation for all things necessary to complete the Work.

Section 540-Removal of Existing Bridge

The cost of excavation needed only to remove or dispose of all or parts of an existing structure, and which is not within the limits of an excavation required as part of another Pay Item, shall be included in the Contract Price for this work. This price shall also include the cost of backfilling excavation performed for these purposes.

Payment will be made under:

Item No. 540	Removal of Existing Br, Sta No -	Per lump sum
Item No. 540	Removal of Existing Br, Br No -	Per lump sum
Item No. 540	Removal of Parts of Existing Bridge, Sta No -	Per lump sum
Item No. 540	Removal of Parts of Existing Bridge, Br No -	Per lump sum

540.5.01 Adjustments

General Provisions 101 through 150.

Section 541—Detour Bridges

541.1 General Description

This work consists of constructing, maintaining, and removing detour bridges.

Construct detour bridges the width and length required on the Plans. (The bridge width is the clear distance between curbs or hubguards.) Construct the bridges at the locations required on the Plans and provide the necessary end walls or bulkheads as part of the Work.

541.1.01 Definitions

General Provisions 101 through 150.

541.1.02 Related References

A. Standard Specifications

Section 104—Scope of Work

Section 105—Control of Work

Section 540—Removal of Existing Bridge

B. Referenced Documents

AASHTO HS-15

AASHTO Standard Specifications for Highway Bridges

Georgia Standard 4960 and 4961

541.1.03 Submittals

A. Bridge Design Considerations

Unless otherwise shown, design detour bridges for an AASHTO HS-15 live load capacity. This capacity is based on the working stresses allowed for the materials used and for the design criteria of the AASHTO Standard Specifications for Highway Bridges.

The Contractor may omit lane loadings from design considerations. Load factor design is allowed.

B. Bridge Drawings

Submit the proposed layout and details for each detour bridge to the Engineer for review as follows:

1. Do not begin work until the drawings have been approved.
2. Submit drawings in either of the following forms:
 - Three prints
 - A reproducible drawing

The Engineer can require the Contractor to change the drawings to conform to the Specifications.

3. After making required changes, resubmit the drawings for final review.

541.2 Materials

Use materials approved by the Department. Material restrictions are as follows:

- Do not use timber in the superstructure.
- Do not use structurally unsound materials of any type.

Piling may be timber. Tight bark does not need to be removed from timber piles.

541.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

541.3 Construction Requirements

541.3.01 Personnel

General Provisions 101 through 150.

541.3.02 Equipment

General Provisions 101 through 150.

541.3.03 Preparation

General Provisions 101 through 150.

541.3.04 Fabrication

General Provisions 101 through 150.

541.3.05 Construction

A. Construct the Detour Bridge

Construct the detour bridge according to drawings approved by the Engineer.

B. Construct Safety Features

Construct either of the following safety features at both ends of the detour bridge:

1. Guard rail
Construct according to the Construction Details shown in the Plans.
2. Precast median barrier according to Ga. Std. 4960 and 4961
When the precast median barrier option is selected, construct the barrier as follows:
 - a. Place the precast median barrier on both sides and both ends of the detour bridge unless otherwise directed by the Engineer.
 - b. Ensure that the barrier extends at least 40 ft (12 m) from the bridge ends unless the Plans show otherwise.

C. Remove the Detour Bridge

After the permanent construction is open to traffic, remove the detour bridge according to Section 540.

Material salvaged from the detour bridge remains the property of the Contractor. Consider the salvage value when compiling the bid.

541.3.06 Quality Acceptance

General Provisions 101 through 150.

541.3.07 Contractor Warranty and Maintenance

A. Maintain the Detour Bridge

Except as otherwise provided in Subsection 104.05.D, “Detours Outside Right-of-Way,” maintain the detour bridge so it can safely carry the design loading at all times. Furnish labor and material to maintain the bridge.

If the Engineer determines that the detour bridge endangers public safety, promptly repair the bridge. If the bridge is not repaired immediately, the Engineer will proceed according to Subsection 105.15, “Failure to Maintain Roadway or Structures.”

541.4 Measurement

This work will not be measured separately for payment.

541.4.01 Limits

General Provisions 101 through 150.

541.5 Payment

This work will be paid for at the Contract Price per detour bridge complete in place, maintained, and removed.

Payment will be made under:

Item No. 541	Detour bridge (requires width, length, and sta. no.)	Per lump sum
--------------	--	--------------

541.5.01 Adjustments

After the detour bridge is completed, the Engineer will include 80 percent of the Contract Price for the detour bridge in the next statement.

After the detour bridge is satisfactorily removed, the Engineer will include the remaining 20 percent in the next statement.

Section 542-Contractor Proposed Alternate to Reinforced Concrete Deck Girder

542.1 General Description

This Specification covers design requirements for superstructures proposed by the Contractor as alternates to cast-in-place reinforced concrete deck girder structures.

This work is limited to construction using precast reinforced or precast prestressed concrete stems, including AASHTO Type I beams.

For areas not specifically covered in this Specification, refer to the applicable portions of the Project Specifications, Standard and Supplemental Specifications of the Department, and Part I of the AASHTO Specifications for Highway Bridges with interim and Guide Specifications.

542.1.01 Definitions

General Provisions 101 through 150.

542.1.02 Related References

A. Standard Specifications

Section 105—Control of Work

B. Referenced Documents

AASHTO Specifications

AASHTO Specifications for Highway Bridges, including interim and Guide Specifications

542.1.03 Submittals

A. Department's Responsibilities

The Department will quickly review submittals to avoid delaying the Contractor's scheme.

The Department will judge the completeness, accuracy, and structural acceptability of submittals.

B. Contractor's Bid Price

Include the following in the bid price:

- Costs for complying with this Specification
- Costs for completing and revising the Department Plans

C. Submittals

The Contractor may bid based on using precast reinforced or precast prestressed concrete stems. When bidding is based on an alternate design, submit a Contractor-proposed alternate.

1. Follow Submittal Guidelines

Follow these guidelines for submittals:

- a. Submit the Plan on reproducible mylar sepias.
- b. Submit design notes, except for computer printouts, on A4 paper, neatly bound, indexed, and stamped by the Design Engineer.
- c. Allow the Department 60 days from the date it receives the submission to review the construction Plan.
- d. Do not begin bridge construction until the construction Plans are reviewed and approved.

Section 542-Contractor Proposed Alternate to Reinforced Concrete Deck Girder

- e. Ensure that the Plans and notes indicate they have been checked by the Department's Bridge and Structural Design section.

2. Submit the Contractor-Proposed Alternate

Even when submitting an alternate, assume responsibility for the Plans and working drawings required by Subsection 105.02, "Plans and Working Drawings."

Submit alternate construction Plans and design notes that are prepared and stamped by the Design Engineer.

The alternate Plans submitted shall include, but not be limited to, the items below. Indicate the information using the same format used on the Department Plans.

a. General Plan and Elevation Sheet

Show the following on this sheet for each Contractor-proposed alternate structure bid:

- Span lengths
- Pier locations
- Minimum horizontal clearances from the pier face to the edge of the roadway
- Minimum vertical clearances from the bottom of the lowest portion of the superstructure to the roadway surface (outside edge of shoulder to outside edge of shoulder)
- The 28-day concrete strength for the superstructure and substructure
- Yield and working strengths of the reinforcing steel proposed for the superstructure and the substructure
- Design Specifications and interim Specifications used during the design of the structure
- Design live loading, impact factor, and the future wearing surface loading.

b. Details of the Proposed Structure

On projects that involve widening existing structures, eliminate the tie strips shown on the Department Plans. Include in the proposal for the Project the cost savings from eliminating the tie strips.

Include the following items in the structure details:

- Each cross section at the midspan, end bent, and intermediate bent showing reinforcing steel size, spacing, and location
- Concrete dimensions relative to computing the structural properties of the members
- The dimensions of fillets
- The spacing and size of the web stirrups and longitudinal reinforcing, shown in a longitudinal view of the stem
- Design notes indicating how the spacings and sizes of reinforcing bars were obtained

c. Details of the Size and Type of Tendons for Prestressed Alternate

Include on the drawings the size and type of tendons for prestressed alternate, the horizontal location, and the vertical profile. Also include the following:

- Location of the hold-down point for the tendons
- Initial prestress force and strength of concrete when the tendons are released
- Method of retaining the depressed tendons in place
- Calculations for determining the tendon elongation required to produce the specified pretensioning force
- Calculations for determining the casting length
- Detensioning schedule

d. Dead Load Deflections from the Slab, Stem, Coping, and Barrier

e. Camber for the Stems

Include in the camber the effects of vertical curvature.

542.2 Materials

General Provisions 101 through 150.

542.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

542.3 Construction Requirements

542.3.01 Personnel

General Provisions 101 through 150.

542.3.02 Equipment

General Provisions 101 through 150.

542.3.03 Preparation

General Provisions 101 through 150.

542.3.04 Fabrication

General Provisions 101 through 150.

542.3.05 Construction

A. Design and Construct Team

Contractor-proposed alternates are considered a design and construct proposal. The design and construct team shall consist of a Contractor and a Design Engineer.

1. Contractor

The Contractor is responsible for engineering design, drawing, detailing, Plan preparation, printing, and other Work necessary to modify the Department Plans for the proposed scheme.

2. Design Engineer

The Design Engineer must be registered as a Professional Engineer in the State of Georgia.

The Design Engineer is responsible for the following:

- Remain a part of the team and be available to discuss the Project with the Department at any time during the Project.
- Keep a record of Project-related communications with the Department, including copies of correspondence and transcripts of conversations.
- Provide copies of the communication record to the Department and the Contractor.

B. Criteria for Contractor-Proposed Alternates

Contractor-proposed alternates shall be subject to the following criteria:

1. Comply with the traffic handling and sequence of operation schemes found on the Plans and Specifications.

2. Do not change the following items from the Department Plans:

- Horizontal and vertical alignments
- Beginning and ending bridge stations
- Minimum horizontal clearance
- Span lengths

3. If necessary, reduce vertical clearances from those indicated on the Plans by following the restrictions below and submitting mathematical computations indicating a check of revised vertical clearance.

Section 542-Contractor Proposed Alternate to Reinforced Concrete Deck Girder

- a. Ensure that the minimum vertical clearance as measured from the lowest point of the bridge superstructure to the roadway beneath is no less than 16.5 ft (5.1 m) or the minimum amount shown on the Plans, whichever is less.
- b. Do not reduce the vertical clearance from the bottom of the superstructure to the flood elevations indicated on the Plans if either of these situations occur:
 - The proposed alternate involves a structure crossing a waterway.
 - The bottom of the beam intrudes into the 100-year flood plain.
4. Construct the bridge superstructure using either a precast reinforced or precast prestressed concrete stem that meet the following criteria:
 - a. The section depth, measured from the top of the top slab to the bottom of the stem may deviate from the Plans if the vertical clearance requirement in of Subsection 542.3.05.B.3 “Criteria for Contractor-Proposed Alternates,” is satisfied.

The stem depth shall be constant throughout the length of each structure unless indicated otherwise on the Plans.
 - b. The stem and deck thicknesses may vary from the Plans; however, the center-to-center stem spacing shall not vary.
 - c. Give particular attention to skewed structures. The Plans shall clearly indicate all dapouts and skewed end dimensions.
 - d. Precast stems shall be fabricated at a site approved by the Department.
 - e. Precast stems shall be designed for construction without using falsework.
5. Meet the following design criteria for alternate Plans:
 - a. The bearing area and edge distance requirements follow AASHTO Specifications.
 - b. The substructure remains as designed on the Department Plans except for the following adjustments:
 - Elevations that accommodate a deeper superstructure
 - Cap widths that provide adequate bearing area

The Department will not allow adjustments in substructure quantities resulting from adjusting the elevations or cap widths.
 - c. The design complies with applicable requirements of the following:
 - Current AASHTO Specifications for highway bridges, including interim and guide Specifications
 - This Specification

If this Specification and the AASHTO Specifications conflict, this Specification shall apply.
 - d. The structure meets the AASHTO live-loading requirement indicated on the Department Plans.
 - e. The design dead load of the structure considers the following:
 - Weight of the structure
 - Weight of the future wearing surface
 - Construction loads
 - f. Precast prestressed concrete stems meets the following requirements:
 - Initial tension (before losses from creep and shrinkage) shall not exceed 200 psi (1.38 MPa) or $3\sqrt{f'_{ci}}$
 - Final tension (after losses) shall not exceed $3\sqrt{f'_c}$
 - g. Concrete is normal weight and has a minimum concrete cylinder compression strength at 28 days of at least that indicated on the Plans.

For design purposes, do not consider 28-day concrete strength above 3,000 psi (20 MPa) for cast-in-place deck construction.
 - h. The deck has drain openings the same shape, size, and location as those shown on the Plans.
 - i. The barrier curbs are not considered effective in resisting longitudinal stresses and are constructed as shown on the Plans.

Section 542-Contractor Proposed Alternate to Reinforced Concrete Deck Girder

- j. Reinforcing steel in the superstructure having a vertical clearance of 4 in (100 mm) or less, as measured from the top of the top slab to the top of the reinforcing bar, is epoxy coated if the Plans specify epoxy-coated bars. Barrier curb reinforcing steel is epoxy coated as shown on the Department Plans.
- k. The minimum cover for reinforcing steel is as shown on the Plans.
- l. The effective flange depth is altered as follows:
 - 1) When calculating design section properties, deduct 1/4 in (6 mm) from the flange depth. However, when calculating the dead load moment, shear, and reaction, include the 1/4 in (6 mm).
 - 2) Where stay-in-place PSC deck panels are used, deduct 1 in (25 mm) from the effective flange depth when calculating design section properties. However, when calculating the dead load moment, shear, and reaction, include the 1 in. (25 mm).
- m. Bearing pads or bearing assemblies are placed normal to beams.
Place bearing pads or bearing assemblies no closer than 1-1/2 in (40 mm) to the end of the beams and 3 in (75 mm) to the edge of the cap.
- n. Sole plates are beveled.
- o. Bent tops are not sloped for bearing purposes.
- p. Neoprene bearing pads used with a precast beam alternate have 3/16-in (5 mm) sealing ribs on the top and bottom of each neoprene pad.
- q. The following dead loads are added to the non-composite loads for metal stay-in-place forms:

Main Slab Reinforcement Normal to Beams	9.25 lbs/ft ² (45 kg/m ²)
Main Slab Reinforcement Skewed to Beams	16.00 lbs/ft ² (78 kg/m ²)

542.3.06 Quality Acceptance

General Provisions 101 through 150.

542.3.07 Contractor Warranty and Maintenance

Ensure the following:

- The design meets the Specification requirements for final design loads.
- Calculations and construction engineering ensure that adjustments during construction account for deflections.
- Proper line, grade, structural capacity, and stresses in the substructure and the superstructure are retained during construction.

542.4 Measurement

Material or work required to construct the Contractor-proposed concrete superstructures are not measured for payment.

Payment for the superstructure will be full compensation for furnishing the labor, materials, equipment, tools, and incidentals necessary to complete the Work, including the following:

- Concrete
- Reinforcing steel
- Expansion joint material
- Waterproofing
- Bearing pads
- Barrier concrete
- Design
- Redesign
- Plan preparation
- Shop drawings

Section 542-Contractor Proposed Alternate to Reinforced Concrete Deck Girder

- Concrete finish
- Other superstructure elements necessary for constructing the bridge

542.4.01 Limits

A. Additional Compensation

No additional compensation will be made for the following:

- Additional material, equipment, or other items the Department requires after its review of the Contractor's alternate for Project Specification conformance
- Changes or deviations from the Contractor's Plan, as approved by the Department
- Additional material, equipment, or other costs needed because of changes in the Contractor's Plan

542.5 Payment

A. Preparation and Review Time

Charge the time required for preparation of construction plans and design notes to the allowable Contract time.

B. Superstructure

Work performed and materials furnished in place as required by this Specification will be paid for at the Contract Price bid for "Lump Superstr Conc, CL, Br. No." and "Lump Superstr Reinf Steel, Br No."

C. Superstructure—Bridge Complete

Work performed and materials furnished in place as required by this Specification will be paid for at the Contract Price bid for "Lump Construction of Bridge Complete to Bottom of Cap—Alt 4."

542.5.01 Adjustments

A. Partial Payment

The Department will determine a schedule for partial payments for the lump superstructure items.

Section 543—Bridge Complete

543.1 General Description

This work consists of constructing the bridge complete as shown in the Contract. The work includes furnishing and placing all bridge components from the bottom of the cap to the top of the superstructure.

543.1.01 Definitions

General Provisions 101 through 150.

543.1.02 Related References

A. Standard Specifications

Section 211—Bridge Excavation and Backfill

Section 500—Concrete Structures

Section 511—Reinforcement Steel

Sections 500 to 542

B. Referenced Documents

AASHTO Specifications

543.1.03 Submittals

A. Alternative Designs

The Contractor may submit for approval an alternative design for the portion of the bridge between the top of the superstructure and the bottom of the cap. The alternative design shall meet the following criteria:

- The design conforms to current AASHTO Specifications, including the latest Interim Specifications.
- The design live load is HS20-44, including impact.

Submit the design to the Bridge Engineer for review and approval. Do not begin Work or order materials until the Bridge Engineer approves the Plans in writing.

Include the following in the alternative design:

- Three copies of the Plans bearing a Professional Engineer's Stamp of Approval.
The Engineer may require additional copies of the Plans.
- Two copies of complete design notes for the elements of the structure that are a part of the alternate design.
Bridge Plans developed and published by industry organizations, Federal Highway Administration, and other States may be acceptable without design notes. However, the Bridge Engineer will judge the acceptability of the design notes and the Plans.

If the Bridge Engineer does not accept the design, construct the bridge according to the Contract Plans.

543.2 Materials

Use materials that meet the requirements of the applicable Materials sections of the Specifications. Material references are listed in the Specification sections pertaining to the item of work.

543.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

543.3 Construction Requirements

543.3.01 Personnel

General Provisions 101 through 150.

543.3.02 Equipment

General Provisions 101 through 150.

543.3.03 Preparation

General Provisions 101 through 150.

543.3.04 Fabrication

General Provisions 101 through 150.

543.3.05 Construction

A. Bridge Construction

Construct bridges under this Specification according to the drawings.

B. Order Lengths for Prestressed Concrete Pile

The prestressed concrete pile order lengths shown on the Plans are the estimated pile lengths.

On bridges with more than four bents, the estimated pile lengths shown on the Plans apply to the first four bents constructed. The Engineer will adjust the pile order lengths for the remaining bents based on the pile driving for the first four bents constructed.

Instead of using Plan lengths or lengths determined by the Engineer, the Contractor may determine order lengths by furnishing and driving a test pile in a permanent pile location. There will be no additional compensation for this test pile.

543.3.06 Quality Acceptance

General Provisions 101 through 150.

543.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

543.4 Measurement

Bridge construction complete to the bottom of the substructure caps will be measured for payment based on a lump sum basis for the bridge complete, accepted in place.

543.4.01 Limits

A. Lump Sum Inclusions and Exclusions

The lump sum includes payment for superstructure elements and substructure caps.

The lump sum does not include the cost of piling portions embedded in the substructure caps as shown on the Plans.

B. Concrete Bent Measurement

Where foundation conditions require the use of a concrete bent instead of a trestle pile bent, concrete and reinforcement steel below the bottom of the substructure cap will be measured and paid for according to Section 500, Section 511, and Section 211.

543.5 Payment

This work will be paid for at the Contract Unit Price bid. Payment will be full compensation for furnishing all materials and completing the Item according to these Specifications.

Payment will be made under:

Item No. 543-1100	Construction of bridge complete to bottom of cap	Per lump sum
-------------------	--	--------------

543.5.01 Adjustments

Statements for partial payment include:

Item	Payment
Caps, each	20% of Item 543 divided by number of caps
Superstructure, per span	80% of Item 543 divided by number of spans

Section 544—Deck Drain System

544.1 General Description

This work includes furnishing deck drainage systems according to Plan details.

544.1.01 Definitions

General Provisions 101 through 150.

544.1.02 Related References

A. Standard Specifications

Section 645—Repair of Galvanized Coatings

Section 870—Paint

B. Referenced Documents

General Provisions 101 through 150.

544.1.03 Submittals

Submit complete detail Shop Drawings for the deck drain system to the Engineer for approval.

If the deck drain system is for a railway, the Engineer will submit the Shop Drawings to the Chief Engineer of the railway company for approval.

In either case, obtain approval from the Engineer prior to fabrication or installation.

544.2 Materials

Use materials that meet Plan requirements. Use commercial-grade steel hardware (clips, brackets, bars, etc.) unless otherwise noted on the Plans. Use galvanizing repair compound that meets the requirements of Section 870.

544.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

544.3 Construction Requirements

544.3.01 Personnel

General Provisions 101 through 150.

544.3.02 Equipment

General Provisions 101 through 150.

544.3.03 Preparation

General Provisions 101 through 150.

544.3.04 Fabrication

General Provisions 101 through 150.

544.3.05 Construction

Repair damaged galvanized areas according to Section 645.

Install deck drain systems according to the Plans.

544.3.06 Quality Acceptance

General Provisions 101 through 150.

544.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

544.4 Measurement

This work is not measured separately for payment.

544.4.01 Limits

General Provisions 101 through 150.

544.5 Payment

This work will be paid for at the Contract Price for deck drain system complete in place.

Payment will be made under:

Item No. 544	Deck drain system—bridge no.____	Per lump sum
--------------	----------------------------------	--------------

544.5.01 Adjustments

General Provisions 101 through 150.

Section 547—Pile Encasement

547.1 General Description

This Item includes furnishing all labor, materials, equipment, and services necessary to clean and encase steel piles as indicated on the Plans. Complete all work according to this Specification and to the Engineer’s satisfaction.

547.1.01 Definitions

General Provisions 101 through 150.

547.1.02 Related References

A. Standard Specifications

Section 500—Concrete Structures

Section 514—Epoxy Coated Steel Reinforcement

Section 801—Fine Aggregate

B. Referenced Documents

ASTM 2262

ASTM C 939

ASTM D 737

ASTM D 1682

547.1.03 Submittals

When substituting equal products or systems for one of the two encasement procedures noted in this Specification, obtain approval from the Engineer before use. Submit complete data, including:

- Company name and address
- Description of the product or system previously used on similar projects and how they were used
- List of products and their application
- Length of time the products have been in use (at least three years)
- Length of time the applicator has been in business

547.2 Materials

A. Fabric for Pile Jacket

For encasement systems, use pile jacket fabric that conforms to the following requirements:

Requirements for Pile Jacket Material	
Warp	21 ends per inch (25 mm) 1260 denier
Fill	Nylon 66 fill -- 20 picks per inch (25 mm) 1840 denier
Approximate Weight	Dupont Cordura -- 9 oz per sq yd (305 g/m ²)
Tensile Strength	(ASTM D 1682 grab method at 1 in/min (25.4 mm/min) in excess of 400 lbs/inch (70 N per mm) in both warp and fill directions
Tearing Strength	(Tongue method ASTM 2262)—100 lbs (445 N)
Air Permeability	(ASTM D 737) in excess of 100 ft (30 m) per min.

B. Mortar for Pile Encasement Procedure 2

Maintain mortar at a uniform consistency to avoid pumping problems. When using concrete sand, keep mortar consistency in the 12-second to 15-second range through the 3/4 in (19 mm) orifice of a standard flow cone, as described in ASTM C 939. When using mason’s sand, keep consistency in the 30- to 35- second range through a 1/2 in (13 mm) orifice.

1. Admixtures

When recommended by the manufacturer, use admixtures such as grout super plasticizer, water-reducing agent, or air-entraining agent to improve pumpability or to retard setting time. The Department recommends that a pozzolanic admixture be substituted for up to 30 percent of the cement.

2. Mortar mix for Pile Encasement Procedure 2

Use mortar mix for pile encasement that conforms to the following proportions:

Cement	1,130 lbs/yd ³ (670 kg/m ³)
Sand, Concrete, or Masonry	2,000 lbs/yd ³ (1187 kg/m ³) Subsection 801.2.02
Water	565 lbs/yd ³ (335 kg/m ³)
Water/Cement Ratio	0.50

C. Epoxy-Coated Steel Reinforcement

Use epoxy-coated steel reinforcement that conforms to Subsection 514.2, “Materials.”

D. Class A Concrete Deposited in Water

Use concrete with a 10 percent increase in cement factor. Ensure that concrete is air entrained according to Section 500, with a maximum slump of 8 in. (200 mm).

547.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

547.3 Construction Requirements

General Provisions 101 through 150.

547.3.01 Personnel

General Provisions 101 through 150.

547.3.02 Equipment

General Provisions 101 through 150.

547.3.03 Preparation

A. Cleaning

Sandblast piles on existing structures to be encased to remove loose dirt, rust, scale, and other deleterious material from the surface. Rinse thoroughly with clean water. Do not sandblast piles to be used on new construction. Clean new piles with a wire brush to free them of rust or other loose material.

547.3.04 Fabrication

General Provisions 101 through 150.

547.3.05 Construction

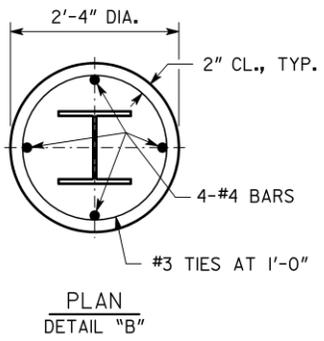

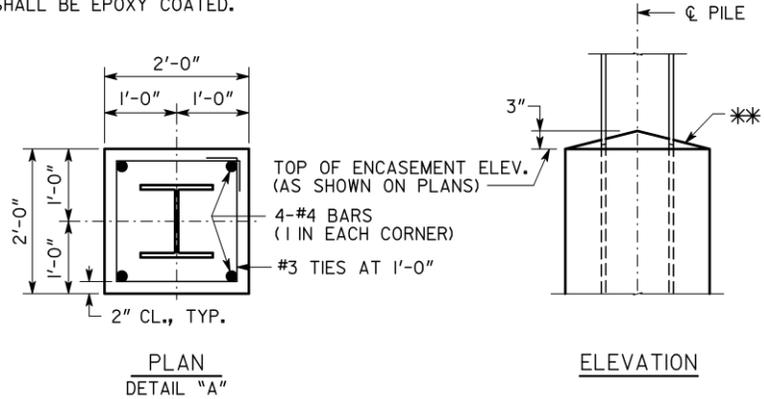

A. Encasement

To perform encasement, follow the details of Figure 1 (Figure 1 metric) and one of the following procedures:

Section 547-Pile Encasement

COST OF #3 TIES AND #4 BARS TO BE INCLUDED IN PRICE BID FOR PILE ENCASEMENT. #3 TIES AND #4 BARS SHALL BE EPOXY COATED.

**SLOPE TOP OF ENCASEMENT AS INDICATED TO ENSURE POSITIVE DRAINAGE.

ENCASEMENT MAY CONFORM TO THE DETAILS OF EITHER DETAIL "A" OR DETAIL "B".
STIRRUPS FOR ENCASEMENT ON EXISTING BRIDGES MAY BE LAPPED.

Figure 1

COST OF #10M TIES AND #13M BARS TO BE INCLUDED IN PRICE BID FOR PILE ENCASEMENT. #10M TIES AND #13M BARS SHALL BE EPOXY COATED.

**SLOPE TOP OF ENCASEMENT AS INDICATED TO ENSURE POSITIVE DRAINAGE.

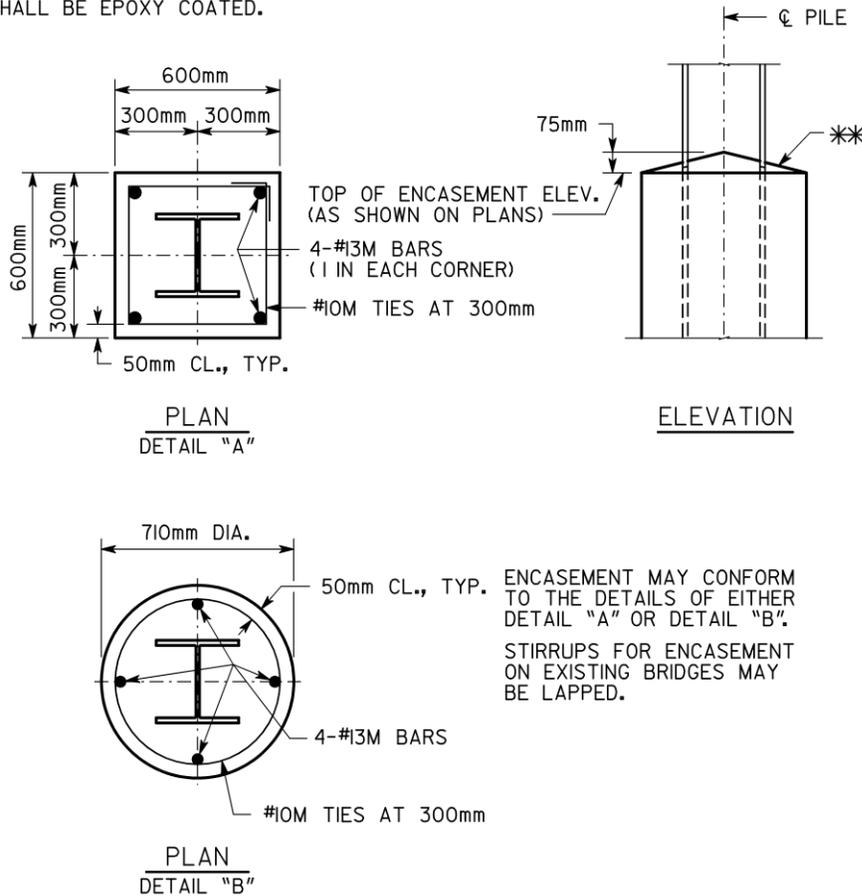

Figure 1 (metric)

1. Procedure 1

Form the pile encasement with class "A" concrete deposited in water and epoxy-coated steel reinforcement.

Place the concrete according to Subsection 500.2.01.E, "Concrete Handling and Placing," where site construction conditions allow. The Department will not require cofferdams. Concrete may be deposited in water.

2. Procedure 2

Form the pile encasement with a Fabriform Pile Jacket System or an approved equal.

Pump mortar into the fabric jacket using two tremie hoses extending to the bottom of the jacket. Withdraw these hoses during pumping so that the lower end remains 1 to 2 ft (300 to 600 mm) under the rising mortar surface.

Pump mortar at a rate to provide a rise of approximately 6 in (150 mm) per minute.

B. Installation

After cleaning the pile, place steel reinforcement as shown in Figure 1 (Figure 1 metric). Place spacers, tremie hoses, and fabric jacket or forms according to the Specifications or the manufacturer-recommended methods. Fill the encasement with concrete or mortar.

547.3.06 Quality Acceptance

A. Limits of Encasement

Ensure that the pile encasement extends from 2 ft (600 mm) below the existing streambed to the top elevation for pile encasement, as shown on the Plans.

547.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

547.4 Measurement

Pile encasement is measured by the linear foot(meter) for each pile size indicated.

547.4.01 Limits

General Provisions 101 through 150.

547.5 Payment

Pile encasements will be paid for at the Contract Price per linear foot (meter) for the pile size indicated, complete in place as specified.

This payment will be full compensation for furnishing all materials, tools, labor, equipment, and other items necessary to complete the Work.

Payment will be made under:

Item No. 547	Pile encasement, ___in.(mm) pile	Per linear foot (meter)
--------------	----------------------------------	-------------------------

547.5.01 Adjustments

General Provisions 101 through 150.

Section 550—Storm Drain Pipe, Pipe-Arch Culverts, and Side Drain Pipe

550.1 General Description

This work includes furnishing and installing the following:

- Storm drain pipe
- Pipe-arch and elliptical culverts
- Side drain pipe flared end sections
- Tapered pipe inlets

Install structures according to the Specifications and the details shown on the Plans, or as directed by the Engineer.

550.1.01 Definitions

Side Drain – All driveway pipe (commercial, non-commercial, residential, utility, farm, logging, and mining).

General Provisions 101 through 150.

GDT 136

550.1.03 Submittals

General Provisions 101 through 150.

550.2 Materials

Ensure materials meet the requirements of the following Specifications:

Material	Section
Backfill Materials	207
Graded Aggregate	815
Reinforced Concrete Pipe	843.2.01
Nonreinforced Concrete Pipe	843.2.02
Mortar And Grout	834.2.03
Bituminous Plastic Cement	848.2.05
Rubber Type Gasket Joints (Concrete Pipe)	848.2.01
Preformed Plastic Gaskets	848.2.06
Corrugated Steel Pipe	844.2.01
Bituminous Coated Corrugated Steel Pipe	844.2.02
Corrugated Aluminum Alloy Pipe	840.2.01
Bituminous Coated Corrugated Aluminum Pipe	840.2.03

Section 550-Storm Drain Pipe, Pipe-Arch Culverts, and Side Drain Pipe

Material	Section
Aluminized Type 2 Corrugated Steel Pipe	844.2.06
Ductile Iron Pipe, Fittings and Joints	841
Precoated, Galvanized Steel Culverts	844.2.05
Smooth Lined Corrugated High Density (HDPE) Polyethylene Culvert Pipe	845.2.01
Polyvinyl Chloride (PVC) Profile Wall Drain Pipe	846
Polyvinyl Chloride (PVC) Corrugated Smooth Interior Drain Pipe	846
Miscellaneous Pipe	847

Use any of the following types of pipe:

- Reinforced concrete
- Nonreinforced concrete
- Corrugated steel or Aluminum
- Smooth-lined corrugated high density polyethylene (HDPE)
- Ductile iron
- Polyvinyl Chloride (PVC) Profile Wall Drain Pipe
- Polyvinyl Chloride (PVC) Corrugated Smooth Interior Drain Pipe

Use the type of pipe designated on the Plans, or acceptable alternate types when applicable. For a display of acceptable alternate pipe types see Selection Guideline for Culvert, Slope and Underdrain Pipe in Chapter 10 – Material Selection of the Department’s Manual on Drainage Design for Highways. This document summarizes general applications for pipe.

For concrete, corrugated steel and aluminum pipes see Ga. Std. 1030D for minimum thicknesses, minimum cover, maximum fill, allowable pipe diameters and trench construction detail.

For HDPE and PVC pipes see Ga. Std. 1030P for minimum cover, maximum fill, allowable pipe diameters and trench construction details.

550.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

550.3 Construction Requirements

550.3.01 Personnel

General Provisions 101 through 150.

550.3.02 Equipment

General Provisions 101 through 150.

550.3.03 Preparation and Backfill

Before installing pipe, shape the foundation material as shown on the Plans.

Prepare structure excavations and foundation according to Section 207. Except, use the following backfill material requirements for HDPE and PVC pipe.

1. For cross drain applications use graded aggregate material meeting Subsection 815.2.01.
2. For Longitudinal and side drain applications use Class II B2 soil or better per Subsection 810.2.01, if Class II B2 or better is not available use material conforming to Subsection 550.3.03.1.

550.3.04 Fabrication

General Provisions 101 through 150.

550.3.05 Construction

A. Drainage

Provide necessary temporary drainage. Periodically remove any debris or silt constricting the pipe flow to maintain drainage throughout the life of the Contract.

B. Damage

Protect the structure by providing sufficient depth and width of compacted backfill before allowing construction over a culvert. Repair damage or displacement from traffic or erosion occurring after installing and backfilling at no additional cost to the Department.

C. Installation

Check vertical and horizontal alignment of the pipe culvert or storm drain pipe barrel by sighting along the crown, invert and sides of the pipe, and by checking for sagging, faulting and invert heaving. Repair any issues involving incorrect horizontal and/or vertical alignment before backfilling pipe.

1. Concrete Pipe

Lay sections in a prepared trench with the socket ends pointing upstream. Join section using either rubber gasket or preformed flexible sealant, installed according to the manufacturer's recommendations.

2. Ductile Iron Pipe

Lay pipe sections in a prepared trench, with bells pointing upstream. Construct joints according to Subsection 841.2.02.A.

3. Corrugated Aluminum or Steel Pipe and Pipe-Arches

Lay pipe sections in a prepared trench, with outside laps of circumferential joints pointing upstream and longitudinal joints at the sides. Join the sections with coupling bands, fastened by two or more bolts. Before backfilling the structure:

- a. Repair exposed base metal in metal coating according to Section 645.
- b. Recoat exposed base metal in bituminous coating with asphalt.

4. Smooth-Lined Corrugated HDPE Pipe

Install smooth-lined corrugated HDPE pipe according to ASTM D 2321. Use fitting and couplings that comply with the joint performance criteria of AASHTO Standard Specifications for Highway Bridges, Division II. Ensure all joints are "silt tight" as stated in the AASHTO bridge specifications.

5. Specials (Wyes, Tees, and Bends)

Install wyes, tees, and bends as shown on the Plans or as directed.

6. Tapered Pipe Inlets

Locate and install tapered pipe inlet end sections as shown on the Plans or as directed.

7. Elongation

Elongate metal pipe as shown on the Plans. Order the elongation of the vertical axis of the pipe to be done in the shop.

Ensure the manufacturer ship metal pipe with wire ties in the pipe ends. Remove wire-ties immediately after completing the fill.

8. Flared End Sections

Use flared end sections on the inlet, outlet, or on both ends of storm drain pipe, according to Plan details.

9. PVC Drain Pipe

Section 550-Storm Drain Pipe, Pipe-Arch Culverts, and Side Drain Pipe

Install polyvinyl chloride (PVC) drain pipe according to ASTM D 2321. Use fittings and couplings complying with the joint performance criteria of AASHTO Standard Specifications for Highway Bridges, Division II. Ensure all joints are “silt tight” as stated in the AASHTO bridge specifications.

550.3.06 Quality Acceptance

A. Post Installation Inspection

Inspect 100% of pipe under the roadbed, 100% of pipe in a closed drainage system and a minimum of 10.0 % of all other locations except in side drain application which are short enough to inspect from each end of the pipe. Conduct post installation inspections in accordance with the requirements of this Specification and GDT 136.

Before post installation inspection, dewater installed pipe (if necessary) and provide the Engineer with a post installation inspection schedule. Notify the Engineer at least seven days in advance of beginning inspection. Perform post installation inspections once compacted backfill has reached a depth of 8 feet or after completion of the pipe installation and final cover, which includes the embankment and all non-asphalt bases and/or subgrades. Notify the Engineer of problems found during the inspection. The Engineer will determine if corrective action is necessary.

Perform post installation inspection with the use of low barrel distortion video equipment with laser profile technology, non-contact video micrometer and associated software.

Video and laser profiling and measurement technology must be certified by the company performing the work to meet the requirements of GDT 136. Inspection contractor personnel completing remote inspections shall be NASSCO – PACP Certified Technicians.

For video recorded, laser profiled pipe indicating deflection is in excess of Specification requirements, the Contractor may elect to further test the pipe with the use of a mandrel. Ensure mandrel meets requirements of GDT 136 and the Engineer has approved before use. Pull the mandrel by hand.

Manual post installation inspection allowed for pipe diameters greater than 48 inches per Subsection 550.3.06.B.

Re-inspect 100% of pipe remediation locations or where replacement was required.

B. Manual Post Installation Inspections

Perform a manual inspection by entering the pipe structure to record video and to make measurements. For all pipe structures considered a confined space, provide entry for all project inspection personnel according to OSHA requirements. Furnish a video recording of each inspection. On the recording, identify the date and time of the inspection, a description of the pipe structure, location, and viewing direction. Record the entire run of pipe. Provide a light source which allows observation of all areas of concern on the video recording. Furnish the video recording in a digital, reproducible format on one of the following media types: DVD or CD.

Measure the deflection of the pipe using either a metal or fabric tape and read to the nearest 0.5 inch (10 mm). Measure crack width using either a crack comparator or a feeler gage capable of measuring 0.01 inch (0.25 mm). Measure joint gaps using a tape or ruler and read to the nearest 0.5 inch (10 mm). Other measuring devices may be used if approved by the Engineer.

Record the measurements and include them in the inspection report. Measure and record the following:

1. The location, length and greatest width of each crack.
2. Smallest inside diameter three times for each pipe section in the run. Take the first measurement vertically from the crown to invert (12 o'clock to 6 o'clock positions). Take the second measurement by rotating 60 degrees from vertical (2 o'clock to 8 o'clock positions). Take the third measurement by rotating 120 degrees from vertical (4 o'clock to 10 o'clock positions). For all measurements, stretch tape to full extent across inside of pipe.
3. Widest gap at each joint in the run.

Record the location and describe other defects not listed above. For each measurement location in a pipe, record the length from the nearest drainage structure.

C. Inspection Report

Submit inspection report to the Engineer after completion of the required post installation inspection. Ensure inspection report meets the requirements of this Specification and GDT 136.

D. Requirements for Concrete Pipe:

1. **Joints:** Note differential movement, cracks, spalling, improper gasket placement, movement or settlement of pipe sections, and leakage in the inspection report. Repair or replace pipe sections to the satisfaction of the Engineer where joint separation is greater than one inch. Repair or replace pipe sections where soil migration through the joint is occurring.
2. **Longitudinal and Transverse Cracks:** Cracks with a width less than 0.01 inch (0.25 mm) are considered hairline and minor and only need to be noted in the inspection report, no corrective action is necessary. When cracks are wider than 0.01 inch (0.25 mm) and extend for a length of 12 inch (300 mm) or more, regardless of position in the wall of the pipe, measure the width, length, and locations of the cracks and diameter of the pipe, both horizontally and vertically, use remediation methods in accordance with recommendations of the pipe manufacturer and submit to the Engineer for review and approval an evaluation utilizing a Professional Engineer that takes into consideration structural integrity, environmental conditions, and the design service life of the pipe.

Seal by a method approved by the Engineer cracks having widths equal to or greater than 0.01 inch (0.25mm) that extend for a length of 12 inch (300 mm) or more and determined to be detrimental. Remediate or replace pipe with cracks widths greater than 0.1 inch (2.5 mm) and determined by the Engineer to be beyond satisfactory structural repair. Repair or replace pipes having displacement across the crack.

Requirements for Smooth-Lined Corrugated HDPE & PVC Drain Pipe

1. **Joints:** Remediate pipe showing evidence of crushing at the joints. Note differential movement, improper joint sealing, movement or settlement of pipe sections, and leakage in the inspection report. Remediate joint separation of greater than 1 inch. Repair or replace pipe sections where soil migration through the joint is occurring.
2. **Cracks:** Remediate cracks or splits in the interior wall of the pipe. Use remediation methods in accordance with recommendations of the pipe manufacturer and accepted and authorized by the Engineer.
3. **Buckling, bulging, and racking:** Note in the inspection report flat spots or dents at the crown, sides or flowline of the pipe due to racking. Note areas of wall buckling and bulging in the inspection report. The Engineer will determine if corrective action is necessary.
4. **Deflection:** Where pipe deflection exceeds 5% of the nominal diameter, submit to the Engineer for review and approval an evaluation utilizing a Professional Engineer taking into consideration the severity of the deflection, structural integrity, environmental conditions, and the design service life of the pipe. Remediate or replace pipe where the evaluation finds the deflection could be problematic or where pipe deflection exceeds 7.5% of the nominal diameter.

F. Requirements for Corrugated Aluminum or Coated Steel Pipe

1. **Joints:** Remediate pipe showing evidence of crushing at the joints. Note differential movement, improper joint sealing, movement or settlement of pipe sections, and leakage in the inspection report. Remediate joint separation of greater than 1 inch. Repair or replace pipe sections where soil migration through the joint is occurring.
2. **Cracks:** Remediate cracks or splits in the interior wall of the pipe. Use remediation methods in accordance with recommendations of the pipe manufacturer and accepted and authorized by the Engineer.
3. **Buckling, bulging, and racking:** Note flat spots or dents at the crown, sides or flowline of the pipe due to racking in the inspection report. Note areas of wall buckling and bulging in the inspection report. The Engineer will determine if an additional evaluation by a Professional Engineer is required. Remediate or replace pipe where the evaluation finds the damaged section could be problematic.

Section 550-Storm Drain Pipe, Pipe-Arch Culverts, and Side Drain Pipe

4. **Deflection:** Where pipe deflection exceeds 5% of the nominal diameter, submit to the Engineer for review and approval an evaluation utilizing a Professional Engineer that takes into consideration the severity of the deflection, structural integrity, environmental conditions, and the design service life of the pipe. Remediate or replace pipe where the evaluation finds the deflection could be problematic or where pipe deflection exceeds 7.5% of the nominal diameter.
5. **Coating:** Note areas of the pipe where the original coating has been scratched, scoured or peeled in the inspection report. The Engineer will determine if repair is necessary. Use remediation methods in accordance with recommendations of the pipe manufacturer and accepted and authorized by the Engineer.

550.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

550.4 Measurement

A. Excavation and Backfill

Backfill materials types II and III are measured according to Subsection 207.4, "Measurement."

B. Flat Bottom and Circular Pipe (All Types)

The overall length of pipe installed, excluding tapered inlets, is measured in linear feet (meters), along the central axis of the diameter of the pipe. Wyes, tees, and bends are included in this measurement.

C. Pipe-Arches

The overall length of pipe-arch installed is measured in linear feet (meters), along the bottom center line of the pipe.

D. Multiple Installations

In multiple installations, each single line of culvert structure is measured separately.

E. Tapered Pipe Inlets

Tapered pipe inlet sections are measured as a unit; do not include them in the overall length of the pipe.

F. Flared-End Sections

Flared-end sections are measured separately by the unit and not included in the overall pipe length.

G. Smooth-Flow Pipe

Smooth-flow pipe is measured by the linear foot (meter) along the pipe invert.

H. Elliptical Pipe

Elliptical pipe is measured in linear feet (meters) along the bottom center line of the pipe.

I. Post Installation Inspection

No measurement will be made for post installation inspection.

550.4.01 Limits

Excavation and normal backfill are not measured for payment.

550.5 Payment

A. Backfill

Backfill will be paid for according to Section 207.

Section 550-Storm Drain Pipe, Pipe-Arch Culverts, and Side Drain Pipe

B. Pipe Installations

Pipe installations complete in place and accepted will be paid for at the Contract Price for each item.

This payment is full compensation for excavating, furnishing, and hauling materials; installing, cutting pipe where necessary; repairing or replacing damaged sections; post installation inspection, making necessary connections; strutting, elongating, providing temporary drainage; joining an extension to an existing structure where required; and removing, disposing of, or using excavated material as directed by the Engineer.

1. Smooth Flow Pipe

The quantity of each diameter and steel thickness of smooth flow pipe as measured will be paid for at the Contract Unit Price per linear foot (meter) bid for the various sizes. Payment is full compensation for furnishing labor, materials, tools, O-ring mechanical joints, equipment, and incidentals to complete this Item, including removing and disposing excavation material.

2. Flared-End Sections

Flared-end sections, measured as specified above, will be paid for at the Contract Unit Price for each section of the specified size.

Payment will also include sawing, removing, and replacing existing pavement removed to install a new drainage structure.

C. Post Installation Inspection

No separate payment will be made for this work. Include the cost in the bid submitted for this pay item.

Payment for this item is made as follows:

One hundred percent of the Contract Price bid per linear foot (meter) is paid when the pipe is installed per the specifications including the required material documentation. The Contract Price is paid before post installation inspection.

Payment will be made under:

Item No. 550	Storm drain pipe ___ in (mm), H=___	Per linear foot (meter)
Item No. 550	Side drain pipe ___ in (mm), H=___	Per linear foot (meter)
Item No. 550	Pipe arch (span) ___ in (mm) x (rise) ___ in (mm)	Per linear foot (meter)
Item No. 550	Tapered pipe inlet ___ in (mm),	Per each
Item No. 550	Flared-end section ___ in (mm),	Per each
Item No. 550	Elliptical pipe ___ in (mm) wide x ___ in (mm) high	Per linear foot (meter)

550.5.01 Adjustments

Excavation will not be paid for separately, but the other provisions of Section 205 and Section 208 shall govern.

Section 551—Pile Protection in Earth Walls

551.1 General Description

This work includes protecting bridge end bent piles located in the stabilized backfill of earth retaining walls.

551.1.01 Definitions

General Provisions 101 through 150.

551.1.02 Related References

A. Standard Specifications

Section 535—Painting Structures

ASTM D 1621

ASTM D 1622

APHA 426 D

551.1.03 Submittals

General Provisions 101 through 150.

551.2 Materials

A. Cans

Place cans of smooth or corrugated steel pipe over piling. Use cans thick enough to prevent buckling while placing and compacting earth-stabilized embankment. Coat both inside and outside of the cans with either of the following:

Material	Section
2P Coating	535.3.03.D
Galvanizing	ASTM A 123/A 123M

B. Backfilling Cans

Use aggregate for the backfilling of cans according to Section 801 or Section 806.

C. Corrosion Inhibitor (Grease)

Use grease that conforms to the following requirements.

Drop point 350 °F (175 °C) minimum		ASTM D 1241
Flash point 350 °F (175 °C) minimum		ASTM D 92
Water content 0.1% maximum		ASTM D 95
Rust test		ASTM D 1743
Water soluble ions	Chlorides, 10 PPM maximum	ASTM B 512
	Nitrates, 10 PPM maximum	ASTM D 992
	Sulfides, 10 PPM maximum	APHA 426 D

D. Polyurethane Foam

Use foam approved for commercial use in Georgia that meets the following requirements:

Minimum density 1.5 lbs/ft ³ (24 kg/m ³)	ASTM D 1622
Compressive strength perpendicular 16 psi (110 kPa) @ 6 percent	ASTM D 1621

E. Polypropylene Fluted Sheets

Use “plastic cardboard” ultra-violet stabilized sheets that are at least 48 in (1.2 m) long. Score or grease sheets to fold around piling and into H-pile web. When adding sections, use at least a 3 in. (75 mm) (shingle style) overlap.

F. Duct Tape

Use duct tape to patch and secure plastic cardboard and polyurethane. Keep duct tape from grease or pile. Use duct tape in sandy backfill to seal overlaps and prevent sand infiltration.

551.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

551.3 Construction Requirements

551.3.01 Personnel

General Provisions 101 through 150.

551.3.02 Equipment

General Provisions 101 through 150.

551.3.03 Preparation

General Provisions 101 through 150.

551.3.04 Fabrication

General Provisions 101 through 150.

551.3.05 Construction

When the Plans require, protect end bent piles from negative skin friction by using one of the following methods.

A. Method A

After driving the end bent piles and before installing the earth reinforcing elements:

1. Place a cylindrical can over each pile to prevent the earth wall backfill material from contacting the pile.

Use a can large enough in diameter to give a 1 in (25 mm) minimum clearance from the pile to the inside of the can.

2. Place a spacer between the pile and the can to prevent the can from contacting the pile during wall backfilling. Extend the cans from the bottom of the earth-stabilized backfill to the bottom of the bridge end bent cap.
3. After positioning the cans, seal them at the top while backfilling to keep rubbish or aggregate out of the can. Keep the cans sealed until fill settlement time has expired.
4. When the wall backfill has reached the bottom of the cap and fill settlement time has expired, fill the cans with aggregate.

B. Method B

Cover the piles with the following amounts of corrosion-inhibiting grease as follows:

- Steel piling = 1/16 in (2 mm) minimum
 - Concrete piling = 1/4 in (6 mm) minimum
1. Apply grease only after driving the piles. Treat only the pile portion that will be in contact with the wall backfill.
 2. In addition to the grease, install a urethane or polypropylene sleeve to protect the grease coating from the backfill.
 3. Use spray-on or preformed sleeves. Replace portions of the sleeve damaged or removed by construction activities during backfill.

551.3.06 Quality Acceptance

General Provisions 101 through 150.

551.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

551.4 Measurement

No separate measurement for payment will be made of the materials and labor required to conform with this Specification.

551.4.01 Limits

General Provisions 101 through 150.

551.5 Payment

No separate payment will be made for pile protection. Include all costs incurred in complying with this Specification in the price bid for the piling.

551.5.01 Adjustments

General Provisions 101 through 150.

Section 555—Tunnel Liner

555.1 General Description

This work includes:

- Driving a tunnel
- Furnishing and installing steel plates for tunnel liner
- Furnishing and erecting brick portals to close each end of the tunnel, when required
- Pressure grouting

Construct to Plan line, grade, and dimensions, according to the applicable Specifications.

555.1.01 Definitions

General Provisions 101 through 150.

555.1.02 Related References

A. Standard Specifications

Section 608—Brick Masonry

Section 615—Jacking or Boring Pipe

Section 645—Repair of Galvanized Coatings

Section 834—Masonry Materials

Section 844—Steel Pipe

B. Referenced Documents

AASHTO Design Specification for Tunneling

AASHTO Standard Specifications for Highway Bridges, Section 26

Manual on Uniform Traffic Control Devices

ASTM A 569/A 569M

555.1.03 Submittals

A. Special Permit Application

Before working with explosives, apply to the Department for a special permit. This permit will be in addition to a tunneling permit not involving explosives.

Special permits will be issued when the proposed operational procedures outlined in the permit form are submitted and approved.

B. Design Data

For Projects not under Contract to the Department but are being performed under permit, the owner shall submit complete design data including working or Shop Drawings for approval before receiving the permit. Include the following applicable design data:

- Design data as required by AASHTO design specification for tunneling
- Subsoil surveys, including the elevation of the water table and the classification and relative density of the soils from the ground line to 3 ft (1 m) below the tunnel liner
- Rock coring data, including rock type and core recovery, where required

- Water control plans, where required

C. Repair Plan

If tunneling damages the roadway, submit a roadway repair plan for approval.

555.2 Materials

Ensure that materials meet the following requirements:

Material	Specification Section
Liner Plates	ASTM: A 569/A 569M
Galvanizing Bituminous Coating and Bolts	844
Brick for Portal	608 834.2.01

A. Liner Plates

Construct the completed liner with a series of steel liner plates assembled with staggered longitudinal joints and fabricated to fit the tunnel cross section.

1. Characteristics

Use hot-dipped galvanized, bituminous-coated steel of the size, thickness, and sectional modulus specified.

Use plates made of hot-rolled, cold-formed steel that conform to ASTM A 569/A 569 M. Use plates with the following mechanical properties before cold forming:

- Tensile strength = 42,000 psi (290 MPa)
- Yield strength = 28,000 psi (190 MPa)
- Elongation, 2 in (50 mm) = 30 percent

2. Grout Intrusion Nipples

Provide grout intrusion nipples 2 in (50 mm) or larger in diameter in the top plates at intervals 10 ft (3 m) or less.

This will permit grouting while the tunnel liner is erected. For larger tunnels, or where conditions make more grout openings advisable, install additional plates with nipples at the top quarter points and/or on each side between the top openings. Stagger these additional openings, but keep the distance between them 10 ft (3 m) or less in any one line.

3. Flanged Joints

Form plates to provide circumferential flanged joints. Use longitudinal joints that are flanged or offset lap seam type. Punch plates for bolting on both longitudinal and circumferential seams or joints.

Space bolts in circumferential flanges according to the manufacturer’s standard spacing. Space bolts a multiple of the plate length so that plates with the same curvature are interchangeable and will permit staggering of longitudinal seams.

4. Longitudinal Seams

For lapped longitudinal seams, ensure that bolt size and spacing is according to the manufacturer’s standard, but meets the longitudinal seam strength requirements of Section 16 of AASHTO Standard Specifications for Highway Bridges. Galvanizing Bituminous Coating and Bolts shall be in compliance with applicable information in Section 844.

B. Grout

Use grout that consists of:

- One part Portland cement
- Two parts masonry lime
- Four parts mortar sand

- Two percent of an approved admixture, (i.e., Bentonite, Septamine Stearex, or Hydrocide Liquid)
- A retardant, where required

Use enough mixing water to produce a workable mixture of grout capable of being pumped into the voids created by tunneling.

C. Brick

Brick for portal shall conform to Section 608 and Subsection 834.2.03.

555.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

555.3 Construction Requirements

555.3.01 Personnel

General Provisions 101 through 150.

555.3.02 Equipment

A. Pumping Equipment

Provide pumping equipment for grouting operations. Use equipment with enough pump horsepower and grouting line pressure to completely fill voids without buckling or shifting the liner plates or damaging the roadway.

B. Water Control

When water control is required, operate well points or other drainage systems in the vicinity of the tunnel construction limits.

555.3.03 Preparation

General Provisions 101 through 150.

555.3.04 Fabrication

General Provisions 101 through 150.

555.3.05 Construction

Excavate the tunnel using any of the following procedures:

- Full face
- Heading and bench
- Multiple drift

Do not use a full or partial shield, a tunneling machine, or other equipment that exerts a force on the liner plates to propel, steer, or stabilize the equipment.

Prevent the overpassing roadway or railway section from settling when constructing tunnels by using:

- Poling plates
- Brest boards
- Shields
- Soil solidification
- A combination of these methods

A. Installation of Liner Plates

Use the same type of liner plates for the full length of the tunnel. Flanged and lapped seam methods of construction are acceptable.

1. General

Install self-supporting steel liner plates according to the manufacturer's recommendations. Do not leave more than 5 ft (1.5 m) of tunnel unlined while tunneling. Do not leave more than 1 ft (300 mm) of tunnel unlined at the end of the day's operation.

2. Sealing

Before grouting tunnel liner segments, seal that segment sufficiently between the liner plates and the surrounding soil to retain the grouting pressure. Place the seals in these locations:

- At the tunnel entrance
- Between grout intrusion nipples
- Within 1 ft (300 mm) of the end of the tunnel

3. Pressure Grouting

Pressure grout voids in the area outside the plates every 10 ft (3 m) at the end of the work shift. Grout more frequently if soil conditions dictate.

4. Repair

Repair damaged spelter coating according to Section 645. Replace plates with damaged spelter or bituminous coatings at no additional cost to the Department if the Engineer determines they cannot be repaired.

B. Safety

Schedule the Work to avoid interfering with or endangering traffic flow on the highway or railway. Follow required safety measures specified in the Manual on Uniform Traffic Control Devices.

1. Begin tunneling at one end of a pit that has been sheeted and shored as necessary. Comply with Section 615. Perform work below the level of the roadbed.
2. Complete tunneling at one location before beginning work at another.
3. If the Engineer determines that tunneling is endangering overpassing roadway or the traveling public, stop tunneling until making the necessary corrections.
4. Provide a well-braced, temporary bulkhead against the face of the excavation when work stops while the heading is within 20 ft (6 m) of railroad tracks or highway pavement.
5. If distress occurs to roadway due to tunneling, the Contractor shall submit for approval a Plan to repair the roadway.

C. Portals

Close tunnel portals at each end using a three-course mortared brick wall according to Plan details. Erect one of the three courses inside the liner.

555.3.06 Quality Acceptance

Ensure that the tunnel has a diameter essentially the same as the outside diameter of the liner plates.

555.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

555.4 Measurement

Tunnel liner installed according to the approved design and these Specifications is measured by the linear foot (meter) complete in place. The liner is measured between the ends of the liner along the invert.

555.4.01 Limits

Portals are not measured for separate payment.

555.5 Payment

This Work, measured as specified above, will be paid for at the Contract Unit Price bid per linear foot (meter) of liner for each diameter and plate thickness. The specified thickness is used for either a two-flange plate or a four-flange plate.

This payment will be full compensation for:

- Furnishing materials, labor, tools, and equipment
- Removing and satisfactorily disposing of all excavated materials
- Force grouting
- Providing tunnel portals, where required
- Restoring and cleaning, including regrassing, as required
- Installing liner

Payment will be made under:

Item No. 555	Tunnel liner ___ diameter, ___ plate thickness (2 flange), or ___ plate thickness (4 flange)	Per linear foot (meter)
--------------	--	-------------------------

555.5.01 Adjustments

General Provisions 101 through 150.

Section 560—Structural Plate Pipe, Pipe-Arch and Arch Culverts

560.1 General Description

This work includes furnishing and installing structural plate pipe, pipe-arch, and arch culverts. Use the type of structural plate structure shown on the Plans.

Install structures according to the Specifications and to Plan details, or as directed by the Engineer.

560.1.01 Definitions

General Provisions 101 through 150.

560.1.02 Related References

A. Standard Specifications

- Section 205—Roadway Excavation
- Section 207—Excavation and Backfill for Minor Structures
- Section 208—Embankments
- Section 645—Repair of Galvanized Coatings
- Section 840—Corrugated Aluminum Alloy Pipe
- Section 844—Steel Pipe

B. Referenced Documents

General Provisions 101 through 150.

560.1.03 Submittals

General Provisions 101 through 150.

560.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Backfill Materials	207
Steel Structural Plate for Pipe, Pipe-Arches, and Arches	844.2.03
Corrugated Aluminum Alloy Structural Plate Pipe, Pipe-Arches and Arches	840.2.04

560.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

560.3 Construction Requirements

560.3.01 Personnel

General Provisions 101 through 150.

560.3.02 Equipment

General Provisions 101 through 150.

560.3.03 Preparation

Prepare structure excavation and foundation according to Section 207.

Before installing structural plate pipe, pipe-arch, or arch culverts, shape their foundation material as shown on the Plans.

560.3.04 Fabrication

General Provisions 101 through 150.

560.3.05 Construction

A. Drainage

Provide necessary temporary drainage.

Immediately remove debris or silt that constricts the flow through a structural plate pipe, pipe-arch, or arch culvert to maintain drainage throughout the life of the Contract.

B. Protection and Repair

Before allowing traffic over a culvert, provide compacted backfill of a depth and width to protect the structure. Repair and correct damage or displacement from traffic, erosion, or negligence at no additional cost to the Department.

C. Installation

Erect structural plate pipe-arches and arches in the sequence recommended by the manufacturer.

1. Bolts

Tighten the bolts only after erecting the whole structure. Set bolts using drift pins or bars to line up the holes.

Tighten bolts with torque wrenches to at least 150 ft-lbs (200 N·m), but not more than 200 ft-lbs (270 N·m) of torque.

2. Repair

If there are damaged spots in the galvanized coating of the pipe, pipe-arch, or culvert where the base metal is exposed, repair according to Section 645.

If there are damaged spots in the bituminous coating of the pipe, pipe-arch, or arch culvert where the base metal is exposed, repair by recoating with asphalt before backfilling the structure.

3. Elongation

Section 560-Structural Plate Pipe, Pipe-Arch and Arch Culverts

Elongate structural plate pipe as shown on the Plans. Have the vertical axis of the pipe elongated in the shop. Ensure that when erection is complete, the elongated axis is in a vertical position.

560.3.06 Quality Acceptance

Clean all structures before final acceptance of the Work.

560.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

560.4 Measurement

A. Excavation and Backfill

Backfill materials Types II and III are measured according to Subsection 207.4, "Measurement."

B. Circular Pipe (All Types)

The overall length of circular pipe in place and accepted is measured in linear feet (meters) along the central axis of the pipe diameter.

C. Pipe-Arches

The overall length of pipe-arch in place and accepted is measured in linear feet (meters) along the bottom center line of the pipe-arch.

D. Multiple Installations

In multiple installations, each single line of culvert structure is measured separately.

E. Arch Culverts

Arch culverts of the dimensions and materials shown on the Plans, complete in place, are measured as a unit that includes necessary foundations, walls, and wings.

560.4.01 Limits

Excavation and normal backfill are not measured for payment.

560.5 Payment

A. Backfill

Backfill will be paid for according to Section 207.

B. Structural Plate Pipe, Pipe-Arch, and Arch Culvert

Structural plate pipe and pipe-arch installations, complete in place and accepted, will be paid for at the Contract Price per linear foot(meter). Arch culvert installations, complete in place and accepted, will be paid for per Lump Sum. This payment will be full compensation for the Item, including:

- Excavating
- Furnishing and hauling materials
- Installing
- Cutting pipe where necessary
- Repairing or replacing damaged sections
- Making connections, strutting and elongating
- Providing temporary drainage

Section 560-Structural Plate Pipe, Pipe-Arch and Arch Culverts

- Joining an extension to an existing structure, where required

Payment will also be full compensation for removing, disposing, or using excavated materials as directed by the Engineer.

Payment will be made under:

Item No. 560	Structural plate pipe ____ in (mm) H= ____	Per linear foot (meter)
Item No. 560	Structural plate pipe-arch (<u>span</u>) in (mm), (<u>rise</u>) in (mm)	Per linear foot (meter)
Item No. 560	Structural plate arch culvert, structure no. ____	Per lump sum

560.5.01 Adjustments

Excavation will not be paid for separately, but all of the other provisions of Section 205 and Section 208 shall govern.

Section 561—Renovating Existing Pipe

561.1 General Description

This work includes furnishing and inserting helically corrugated metal pipe, smooth-lined corrugated polyethylene pipe, high density polyethylene profile wall pipe, and high density polyethylene solid wall pipe or a polyvinyl chloride pipe inside an existing metal pipe and pressure grouting the space between the two pipes.

561.1.01 Definitions

Section 882—Lime

Section 883—Mineral Filler

B. Referenced Documents

GDT 84

561.1.03 Submittals

General Provisions 101 through 150.

561.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Corrugated Steel Pipe (Helically Corrugated)	844.2.01*
Smooth-Lined Corrugated Polyethylene (PE) Culvert Pipe	845
Portland Cement, Types I or II	830
Mineral Filler (Limestone Dust)	883
Fly Ash, Type A	831
Water	880
Fine Aggregate, Size No. 20	801.2.02
Agricultural Lime	882.2.02**
*Use Georgia Standard 1030D to determine the metal thickness of the insert pipe.	
**For this Work, use agricultural lime that has 90 percent minimum passing the No. 30 (600 µm) sieve and 30 percent minimum passing the No. 200 (75 µm) sieve.	

A. High Density Polyethylene (HDPE) Profile Wall Pipe

Use pipe liner that consists of a HDPE profile wall pipe that conforms to the requirements of ASTM F 894. Polyethylene material shall have polyethylene pipe liners material designation of PE 3408 and shall have a material cell classification per ASTM D 3350 of 334433C or higher.

Join HDPE profile wall pipe liner by thermal fusion (extrusion welding) per manufacturer specifications, or provide a positive mechanical joint that meets the requirements of ASTM D 3212. The joint shall be able to be pulled or pushed into the host pipe without joint separation.

B. High Density Polyethylene (HDPE) Solid Wall Pipe

Pipe liner shall consist of a HDPE solid wall pipe that conforms to the requirements of ASTM F 714 with an SDR of 32.5. Polyethylene material shall have polyethylene pipe liners material designation of PE 3408 and shall have a material cell classification per ASTM D 3350 of 345464C.

Join HDPE solid wall pipe liner by butt fusion per ASTM F 2620 and the manufacturer specifications, or provide a positive mechanical joint that meets the requirements of ASTM D 3212. The joint shall be able to be pulled or pushed into the host pipe without joint separation.

C. Polyvinyl Chloride (PVC) Pipe

Pipe liner shall consist of PVC corrugated pipe with a smooth interior that conforms to the requirements of ASTM F 949. PVC pipe shall have a minimum pipe stiffness of 46 psi (317 kPa) when tested according to ASTM D 2412. Use pipe made of PVC compound with a cell classification per ASTM D 1784 of 1245B.

Join the PVC pipe liner with a PVC coupling that uses elastomeric sealing gaskets. The assembled joint shall meet the performance requirements of ASTM D 3212. The joint shall be able to be pulled or pushed into the host pipe without joint separation. Ensure that elastomeric seals meet the requirements of ASTM F 477.

D. Grout Mixtures

Mix water with the dry ingredients to produce a grout with an efflux time from the flow cone of at least 16 seconds and no more than 22 seconds when tested according to GDT 84.

Add cement, cement and limestone dust, or cement and fine aggregate to the batch proportions to produce the required consistency.

Table of Grout Mixtures					
Mix Proportions, Percent by Weight of Dry Materials					
Dry Materials	Grout Types				
	1	2	3	4	5
Cement	25	25	25	25	100
Limestone dust		25	75	50	
Fly ash	25			25	
Fine aggregate	50	50			

561.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

561.3 Construction Requirements

561.3.01 Personnel

General Provisions 101 through 150.

561.3.02 Equipment

A. Batching

Use weight hoppers and scales for each dry material or calibrated volumetric batch hopper. Calibrate volumetric batch hoppers in increments equivalent to one 94 lb (42.6 kg) bag of cement.

B. Mixing

Use a watertight batch-type mixer capable of blending the various materials into a homogenous mixture.

C. Grout Pumping

Use a positive-displacement, piston-type pump or a screw-type worm pump equipped with the following:

- Discharge line with a positive cut-off valve at the nozzle end and a by-pass return line to recirculate the grout back into a holding tank or mixer
- A nozzle or device at the end of the discharge line that will remain secure in the 1 in (25 mm) grout pipe and free of leaks

D. Pulling

Provide equipment capable of pulling the new helically corrugated metal pipe.

561.3.03 Preparation

General Provisions 101 through 150.

561.3.04 Fabrication

General Provisions 101 through 150.

561.3.05 Construction

A. Grout Mixtures

Use the Table of Grout Mixtures in Subsection 561.2.D, “Grout Mixtures.”

B. Installation

Install pipe liner according to the manufacturer’s guidelines and as specified in the plans, with the following requirements:

1. Clean and inspect the existing pipe before pulling or pushing the new pipe through.
2. Use a nose cone on all on all pipe liners. The nose cone shall have enough strength to withstand pulling or pushing of the new pipe liner. Weld or bolt the nose cone to the end of the liner. Use a nose cone that includes a ring for attaching the pulling cable.
3. After pulling or pushing the new pipe through the old one, plug the space between the pipes at both ends with concrete or mortar. Insert a 1 in (25 mm) grout pipe with threaded ends on the outside into the tops of the plugs at both ends of the pipes, and screw on a threaded cap.
4. After the pipe plugs have been in place long enough to develop strength to withstand pressure grouting, remove the grout pipe caps. Connect the grout pump to the downstream grout pipe and pump grout into the void until it flows freely from the upstream grout pipe.
5. After pumping is complete, replace the grout pipe caps.

561.3.06 Quality Acceptance

General Provisions 101 through 150.

561.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

561.4 Measurement

Renovating existing pipe is measured by the linear foot (meter) of the specified diameter of new pipe installed.

561.4.01 Limits

General Provisions 101 through 150.

561.5 Payment

Renovating existing pipe will be paid for at the Contract Unit Price bid per each diameter and metal thickness of new pipe. This payment will be full compensation for completing all work described in this Section, including cleaning and restoring damaged areas.

Payment will be made under:

Item No. 561	Renovating existing pipe _____ in (mm) diameter	Per linear foot (meter)
--------------	---	-------------------------

561.5.01 Adjustments

General Provisions 101 through 150.

Section 570—Minor Drainage Structures for Detours

570.1 General Description

This work includes selecting, constructing, and maintaining minor structures used on detours for cross drains or side drains. Remove these structures when the detour is no longer needed.

This Item covers only the use of minor structures. When the Plans call for constructing, maintaining, and removing a detour bridge, apply Section 541.

570.1.01 Definitions

General Provisions 101 through 150.

570.1.02 Related References

A. Standard Specifications

Section 541—Detour Bridges

B. Referenced Documents

AASHTO HS-15

570.1.03 Submittals

If using a bridge-type structure instead of one or more pipes, present plans of the proposed structure to the Engineer for approval before beginning construction.

570.2 Materials

All selected materials are subject to the following requirements:

A. Bridge-Type Structure

Ensure that each bridge-type structure roadway width is at least 2 ft (600 mm) greater than the approach pavement width or 24 ft (7.2 m), whichever is greater. Ensure that load capacity is equivalent to AASHTO HS-15. Provide suitable hub guards and handrails.

B. Pipe Culvert

Use pipe culverts long enough to accommodate the detour grade and cross section shown on the Plans.

570.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

570.3 Construction Requirements

570.3.01 Personnel

General Provisions 101 through 150.

570.3.02 Equipment

General Provisions 101 through 150.

570.3.03 Preparation

General Provisions 101 through 150.

570.3.04 Fabrication

General Provisions 101 through 150.

570.3.05 Construction

Have the Engineer approve selected construction methods.

Use structures that have adequate openings and are suitable for the purpose intended. Unless otherwise modified by a special provision, provide for an uninterrupted flow of traffic over the existing highway or the completed detour, as the case may be. Assume all risks involved in the design, construction, maintenance, and removal of each structure, including any damage from any cause.

570.3.06 Quality Acceptance

General Provisions 101 through 150.

570.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

570.4 Measurement

The entire structure at the location specified is measured for payment. Multiple lines of pipe used instead of a bridge-type structure or a single larger diameter pipe is considered one structure.

570.4.01 Limits

General Provisions 101 through 150.

570.5 Payment

This Item will be paid for at the Lump Sum price bid for each structure. This price includes the materials, labor, equipment, and small tools necessary to construct, maintain, and remove the structure and to dispose of the materials. Upon removal, materials become the property of the Contractor.

Sixty percent of the Lump Sum price will be paid when the structure is complete in place. The remaining 40 percent will be paid when the maintenance period is complete, the structure removed, and the materials disposed of.

Payment will be made under:

Item No. 570	Construct, maintain, and remove detour drainage structure no.____	Per lump sum
--------------	---	--------------

570.5.01 Adjustments

General Provisions 101 through 150.

Section 573—Underdrains

573.1 General Description

This work includes constructing underdrains with perforated pipe according to the Specifications and the details, lines, and grades shown on the Plans or as directed by the Engineer.

573.1.01 Definitions

General Provisions 101 through 150.

573.1.02 Related References

A. Standard Specifications

- Section 806—Aggregate for Drainage

B. Referenced Documents

General Provisions 101 through 150.

573.1.03 Submittals

General Provisions 101 through 150.

573.2 Materials

Ensure that materials meet the requirements of the Specifications below.

Use any pipe specified below unless the Plans state otherwise. Use only one type of pipe in each continuous, interconnecting line.

Material	Specification
Aggregate for Underdrain	806.2.01
Corrugated Aluminum Alloy Underdrain Pipe	840.2.01
Corrugated Steel Underdrain Pipe	844.2.04
Corrugated Polyethylene Underdrain Pipe	839

573.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

573.3 Construction Requirements

573.3.01 Personnel

General Provisions 101 through 150.

573.3.02 Equipment

General Provisions 101 through 150.

573.3.03 Preparation

General Provisions 101 through 150.

573.3.04 Fabrication

General Provisions 101 through 150.

573.3.05 Construction

Schedule the work so that underdrain installations coincide with other operations on the Project to prevent conflict, damage, or infiltration of materials.

A. Excavation

To intercept water-bearing strata, excavate according to the details and elevation shown on the Plans, or to an increased depth if the Engineer directs.

When the material in the bottom of the trench is unstable, remove unstable material, add approved granular material, and compact to provide a stable foundation for the pipe.

B. Laying Pipe

Lay pipe according to Plan details with the perforations on the underside of the pipe, unless otherwise directed by the Engineer.

1. Lay bell and spigot and tongue and groove pipe with the bell or grooved end upstream and the bells embedded in the foundation material.
2. Firmly connect the joints.
3. Connect pipe and butt joints securely, using the appropriate size and type of band or coupling.
4. Install the following miscellaneous items as indicated on the Plans or otherwise specified:
 - Pipe screens
 - Caps

- Plugs
- Ells
- Wyes
- Tees
- Markers

C. Backfilling

After laying the pipe, place drainage aggregate in 6 in (150 mm) layers. Compact each layer thoroughly until reaching the total Plan depth. Do not disturb pipe alignment.

D. Marking

Mark each outlet end of the drainage system according to Plan details.

E. Protecting from Contamination

Protect the filter material from contamination by foreign matter.

1. Particular attention must be given to the top surface of the filter blanket when it will be covered by an aggregate drainage course. Soil infiltration from placing soil courses over the filter material is incidental to the Work and is not considered contamination.
2. If aggregates become contaminated, remove the contaminated portion and replace it with clean filter material before placing succeeding layers of filter blanket or placing aggregate drainage course.

573.3.06 Quality Acceptance

General Provisions 101 through 150.

573.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

573.4 Measurement

The quantity of underdrain pipe with or without drainage aggregate, complete in place and accepted, is measured in linear feet (meters) along each line or lateral, from center to center of junctions and fittings.

573.4.01 Limits

When the trench is required to be undercut, the depth measurement for determining the underdrain pipe payment will be from the bottom of the required undercut to the final elevation established for the top of the trench.

573.5 Payment

Each size of underdrain pipe will be paid for at the Contract Price per linear foot (meter) as follows:

A. Underdrain Pipe Only

Payment for pipe under this Item will include:

- Ground preparation
- Excavation
- Backfilling
- Disposal of surplus material
- All appurtenances required to complete the Item including screens, tees, wyes, ells, and markers

B. Underdrain Pipe Including Drainage Aggregate

Payment for pipe under this Item will include specified drainage aggregate and all items listed under Subsection 573.5.A above.

Underdrain pipe including drainage aggregate to depths greater than 6 ft (1.8 m) below the final elevation established for the top of the trench will have an adjusted Unit Price. This price will be computed by increasing the Contract Unit Price by a percentage based on the extra depth as follows:

From over 6 ft (1.8 m) to and including 8 ft (2.4 m)	At contract price plus 20 percent
Over 8 ft (2.4 m) deep	By supplemental agreement or force account

C. Contaminated Aggregate

Removal and replacement of contaminated aggregate will not be paid for separately, but will be included in the Bid Price for underdrain pipe.

Payment will be made under:

Item No. 573	Underdrain pipe only ___ in (mm)	Per linear foot (meter)
Item No. 573	Underdrain pipe including drainage aggregate ___ in (mm)	Per linear foot (meter)

573.5.01 Adjustments

General Provisions 101 through 150.

Section 574—Edgedrains

574.1 General Description

This work includes constructing edgedrains with perforated pipe according to the Specifications and to the details, lines, and grades shown in the Plans, or as directed by the Engineer.

574.1.01 Definitions

574.1.03 Submittals

General Provisions 101 through 150.

574.2 Materials

Ensure that materials meet the requirements of the following Specifications.

Use pipe specified below unless the Plans state otherwise. Use only one type of pipe in each continuous, interconnecting line.

Material	Section
Corrugated Aluminum Alloy Underdrain Pipe	840.2.02
Concrete Underdrain Pipe	843.2.03
Corrugated Polyethylene Underdrain Pipe	839
Drainage Aggregate Backfill, Size No. 78	800.2.01
Asphaltic Concrete	400
Plastic Filter Fabric (Non-woven)	881.2.05

574.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

574.3 Construction Requirements

574.3.01 Personnel

General Provisions 101 through 150.

574.3.02 Equipment

General Provisions 101 through 150.

574.3.03 Preparation

Before placing edgedrains, pressure grout and cure pavement slabs in the immediate area. Do not begin work until the Engineer determines that pavement slabs are stable.

574.3.04 Fabrication

General Provisions 101 through 150.

574.3.05 Construction

Complete any opened trenches, including the asphalt cap, each working day. Install edgedrains with other operations on the Project to prevent conflict, damage, or improper infiltration of other materials.

A. Excavating

Excavate according to the details and elevations shown on the Plans or as directed by the Engineer.

B. Placing Filter Fabric

Place filter fabric according to Plan details.

If the drainage aggregate or the filter fabric become contaminated or the filter fabric is damaged during the backfilling operation, remove the contaminated or damaged materials and replace them at no additional cost to the Department.

C. Laying Pipe

Lay pipe according to the Plan details, with perforations on the underside of the pipe, unless otherwise directed by the Engineer.

1. Lay bell and spigot and tongue and groove pipe with the bell or grooved end upstream and the bells embedded in the foundation material.
2. Firmly connect the joints.

3. Connect butt joint pipes securely using the appropriate size and type of band or coupling.
4. Install the following miscellaneous Items according to the Plans or as otherwise specified:
 - Pipe screens
 - Caps
 - Plugs
 - Covers
 - Ells
 - Wyes
 - Tees
 - Markers

D. Backfilling

After laying the pipe, place the additional backfill material in 6 in (150 mm) layers.

1. Before compacting, establish the target density as 1.18 times the average of 5 dry-density determinations made on the material in the trench. Space the 5 determinations over at least 500 ft (150 m), and determine them using the 6-in (150 mm) direct transmission density mode according to GDT 59.
2. Thoroughly compact each layer to 100 percent of the target density and complete to the depth shown on the Plans, details, or as directed by the Engineer.
3. Do not disturb the pipe alignment or damage the filter fabric.
4. Place a compacted asphaltic concrete cap on the trench as shown in the Plan details or as directed by the Engineer.

E. Marking

Mark each outlet end of the drainage system according to Plan details.

F. Protecting from Contamination

Protect the backfill material from contamination by foreign matter.

If aggregates become contaminated, remove the contaminated portion and replace it with clean material before placing succeeding layers.

574.3.06 Quality Acceptance

General Provisions 101 through 150.

574.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

574.4 Measurement

The quantity of edgedrain pipe, including backfill material and filter fabric, complete in place and accepted is measured in linear feet (meters) along each line or lateral, from center to center of junctions and fittings.

574.4.01 Limits

General Provisions 101 through 150.

574.5 Payment

Each size of edgedrain pipe will be paid for at the Contract Price per linear foot (meter).

Payment for pipe under this Item includes:

- Preparation

- Excavation
- Backfilling
- Specified backfill materials and filter fabric
- Disposal of surplus material
- Screens, tees, wyes, and ells
- The asphaltic concrete cap over the trench

Payment will be made under:

Item No. 574	Edgedrain pipe, including backfill material and filter fabric ____ in (mm)	Per linear foot (meter)
--------------	--	-------------------------

574.5.01 Adjustments

General Provisions 101 through 150.

Section 576—Slope Drain Pipe

576.1 General Description

This work includes furnishing and installing slope drains made of corrugated steel pipe, corrugated aluminum pipe, or corrugated smooth-lined polyethylene pipe where shown on the Plans.

576.1.01 Definitions

General Provisions 101 through 150.

576.1.02 Related References

B. Referenced Documents

General Provisions 101 through 150.

576.1.03 Submittals

General Provisions 101 through 150.

576.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Specification
Corrugated Aluminum Alloy Slope Drain Pipe	840.2.02
Corrugated Steel Culvert Pipe	844.2.01
Corrugated Smooth Lined PE Pipe	845.2.01

Ensure that the nominal thickness of the metal for slope drain pipe conforms to the minimum thickness or gauge specified in the design tables, unless otherwise shown on the Plans.

576.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

576.3 Construction Requirements

576.3.01 Personnel

General Provisions 101 through 150.

576.3.02 Equipment

General Provisions 101 through 150.

576.3.03 Preparation

Before placing the pipe, compact the foundation until firm and stable.

576.3.04 Fabrication

General Provisions 101 through 150.

576.3.05 Construction

Place slope drain pipe in an open trench, excavated to the line and grade shown on the Plans or as directed.

Lay pipe sections that have circumferential joints with the outside laps of the circumferential joints uphill.

After installing the pipe:

1. Immediately backfill the trench with excavated materials or other approved material.
2. Place backfill in layers 8 in (200 mm) thick or less.
3. Compact each layer until firm and stable.

576.3.06 Quality Acceptance

General Provisions 101 through 150.

576.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

576.4 Measurement

Slope drain pipe is measured by the actual number of linear feet (meters) of the size installed and accepted.

576.4.01 Limits

General Provisions 101 through 150.

576.5 Payment

Accepted slope drain will be paid for at the Contract Price per linear foot (meter) for the size specified. This price includes full compensation for labor and incidentals necessary to complete the Item.

Payment will be made under:

Item No. 576	Slope drain pipe ____ in (mm)	Per linear foot (meter)
--------------	-------------------------------	-------------------------

576.5.01 Adjustments

General Provisions 101 through 150.

Section 577—Metal Drain Inlets

577.1 General Description

This work includes installing metal drain inlets according to the Specifications and Plan details.

On Projects where the grading and paving are let simultaneously, the Item will be designated as “Metal Drain Inlets—Complete Assembly.” For this type of construction, complete the Work in two stages. Perform Stage 1 Construction immediately after completing an embankment. Perform Stage 2 Construction progressively as the paved shoulders are completed.

On grading Projects where no paving is involved, limit the installations to Stage 1 Construction.

On paving Projects where the grading has been completed and metal drain inlets are in place under Stage 1 Construction, complete each assembly as specified under Stage 2 Construction.

577.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Specification
Concrete Aprons	441
Sand-Cement Bag Rip Rap	603
Slope Drain Pipe	576
Asphaltic Concrete Curb	436
Metal Sheeting and Spelter Coating	844.2.03

For asphaltic concrete spillways, use the mixture for asphaltic concrete curb.

577.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

577.3 Construction Requirements

577.3.01 Personnel

General Provisions 101 through 150.

577.3.02 Equipment

General Provisions 101 through 150.

577.3.03 Preparation

General Provisions 101 through 150.

577.3.04 Fabrication

Fabricate metal inlets as integral units to the shape and dimensions shown on the Plans. The end section and reducer shall not be corrugated or perforated.

577.3.05 Construction

Install metal inlet drainage assemblies at locations shown on the Plans or where directed by the Engineer. Locate inlets to avoid future installations such as guard rail posts and lighting standards.

A. Repair

Repair damaged galvanized coating according to Section 645.

B. Stage Construction

On combination grading and paving Projects, install metal drain inlet assemblies in two construction stages as follows:

1. Stage 1 Construction

As soon as the initial grading of an embankment is completed:

- a. Install metal drain inlets where shown on the Plans or as directed by the Engineer. Each installation includes:
 - Metal inlet
 - Necessary slope drain pipe
 - Concrete aprons or rip rap as required by the Engineer, to control erosion at the outlet end
- b. To direct the water to the inlets, crown the roadbed and construct a roll of embankment material at the shoulder line. Protect and maintain this drainage system to prevent leakage, erosion, and scouring. Keep gutters, pipes, and inlets open.

2. Stage 2 Construction

Complete this second stage operation immediately after paving shoulders to provide a complete drainage installation and prevent erosion of the embankment slopes.

As soon as a section of paved shoulder is completed:

- a. Remove each adjacent inlet from its position placed under Stage 1 Construction and place it in its final position as shown on the Plans.
- b. Field cut a section of slope drain pipe to the required length to connect the existing slope drain pipe to the metal inlet in its new position.
- c. Thoroughly compact the embankment material around the inlet, including the subgrade under the asphaltic concrete spillway. Finish to a smooth, firm surface.

- d. Place the asphaltic concrete mixture for the spillway on the prepared subgrade within the temperature limits set by the Engineer. Thoroughly compact by rolling. Use a hand-operated roller weighing 300 lbs (135 kg) or more or a small power roller satisfactory to the Engineer.

When areas cannot be reached with rollers, compact them with vibratory tampers or hand tampers approved by the Engineer.

- e. After compaction, ensure that the surface and texture is smooth, even, and dense. Shape and complete the shoulders and slopes to conform to the required finished section.
- f. As soon as each drainage assembly is completed, place the asphaltic curb at the edge of the paved shoulder and connect it to the inlet as shown on the Plans.

3. Metal Drain Inlet

Complete assembly construction of each metal drain inlet shall include both Stage 1 Construction and the Stage 2 Construction specified above.

577.3.06 Quality Acceptance

General Provisions 101 through 150.

577.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

577.4 Measurement

Each of the three different types of metal drain inlet installations is measured separately for payment, complete in place and accepted. In each instance, the 2 ft (600 mm) section of corrugated pipe (which is an integral part of each Unit) is included in the measurement.

Measurement of each Metal Drain Inlet—Complete Assembly and each Metal Drain Inlet—Stage 2 Construction includes the asphaltic concrete spillway and the portion of asphaltic concrete curb included, within the limits of each inlet assembly, as shown on the Plans.

Measurement of each Metal Drain Inlet—Stage 1 Construction includes the integral drain unit and rip rap, earth roll, or other incidental construction necessary to direct water into the Inlet.

Other items of construction required in the work and eligible for payment such as slope drain pipe, asphaltic concrete curb, rip rap, and concrete aprons are measured for payment according to the applicable Specification for such items.

577.4.01 Limits

General Provisions 101 through 150.

577.5 Payment

Each of the three types of metal drain inlet installation, measured for payment as described above, will be paid for at the Contract Unit Price per each.

Payment of each Metal Drain Inlet—Complete Assembly will include both the First Stage and Second Stage Construction outlined above.

When First Stage Construction is completed and the installation is satisfactory to the Engineer, 50 percent of the bid price for each such Unit will be included for payment on the next statement.

When the Second Stage Construction is completed and the installation is satisfactory to the Engineer, the remaining 50 percent of the Bid Price for each Unit will be included for payment on the next statement.

All other Items needed to complete the installation and that are eligible for payment will be paid for according to the applicable Specification for such items.

Payment will be made under:

Item No. 577	Metal drain inlet—complete assembly	Per each
Item No. 577	Metal drain inlet—stage 1 construction	Per each
Item No. 577	Metal drain Inlet—stage 2 construction	Per each

577.5.01 Adjustments

General Provisions 101 through 150.

Section 581—Pot Bearings

581.1 General Description

This work includes furnishing and installing pot bearings (fixed and expansion types). Use the quality, type, and size designated in this Specification, on the Plans, or ordered by the Engineer.

581.1.01 Definitions

General Provisions 101 through 150.

ASTM A 709 Grade 36 (ASTM A 709M Grade 250)

A 709 Grade 50 (A 709M Grade 345)

581.1.03 Submittals

Provide the following reports to the Project Engineer and the Office of Materials:

- Certified test reports
- Materials certificates
- Certificate of Compliance to conform with the requirements in this Specification
- Shop drawings
- Certification

A. Shop Drawings

Before fabricating the bearings, submit to the Engineer Shop Drawings according to Subsection 501.1.03.B, “Shop Drawings.” Include the following on the drawings:

- Bearing plan and elevation
- Complete details and sections that show the materials incorporated into the bearing
- ASTM or other material designations
- Vertical and horizontal load capacity
- Rotation and translation capacity
- Compression stress on sliding surfaces and elastomeric surfaces at maximum and minimum design loads
- Complete design calculations
- Complete erection and installation procedure

B. Certification

Have the pot bearing manufacturer furnish the following to the Project Engineer and the Office of Materials:

- Certified test reports
- Material certificates
- Certificate of compliance to conform with these Specifications for each bearing furnished

581.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Material	Section
Painting	535
Structural Steel	851
Anchor Bolts, Nuts, and Washers	852.2.02
Elastomeric Bearing Pads	885
Epoxy Resin Adhesives	886
Bearing Plates with PTFE Surfaces	887

A. Metals

Use the stainless steel sliding surfaces indicated below:

- Stainless Clad Steel Plate: Minimum eight percent stainless steel conforming to the requirements of ASTM A 264 (both Shear Strength and Bond Strength tests in 8.13 and 8.14 of ASTM A 264 are required). Use stainless steel cladding that meets Type 304. Use backing steel (base metal) that meets ASTM Designation A 709 Grade 50W(A 709M, Grade 345 W).
- Stainless Steel Plate Welded To A Steel Backup Plate: Use at least 16 gage (1.6 mm) thickness of the stainless steel plate that meets ASTM 240 Type 304. Use steel backing plate that meets ASTM Designation A 709 Grade 50W (A 709M Grade 345W) unless otherwise indicated on the Plans. Use qualified welders to weld the stainless steel plate to the steel backing. Furnish welding procedures and welder qualification documents to the Department for review and approval prior to fabrication. Weld entirely around the perimeter of the stainless steel plate.
- Solid Stainless Steel Plate: Mill-finish the stainless steel sliding surfaces to a maximum surface roughness of 20 micro-inches (0.50µm), RMS, according to the requirements of ANSI Standard B 46.1. Remove and replace, at no additional cost to the Department, bearing plates whose stainless steel sliding surfaces have been scratched or damaged.

B. Structural Steel

Use structural steel for the masonry plates and the components of the bearings that meet the requirements of these ASTM Specifications:

- ASTM A 709, Grade 36 (ASTM A 709M, Grade 250)
- A 709, Grade 50 (A 709M, Grade 345)

Machine the base pot from a solid steel plate.

C. Anchor Bolts

Use anchor bolts, including nuts and washers, that meet the requirements of Subsection 852.2.02.

D. Elastomeric Material

Ensure that the elastomeric material used as the confined medium within the pot is 100 percent virgin chloroprene (“Neoprene”) that meets the requirements of Section 885. Ensure that the elastomer is a minimum Grade 2 and has a durometer hardness of 50 ± 5 .

Ensure that the sealing rings for containing the elastomer in the pot bearings are as specified by the pot bearing manufacturer, and meet the following requirements:

- Made of brass or stainless steel
- Withstands and transmits all imposed loading
- Allows free movement of the piston
- Contains the elastomer within the pot under the maximum static and dynamic loading
- Prevents contamination of the elastomer with foreign matter

E. Expanded Mortar

Set anchor bolts in preformed or drilled holes using expanding mortar that meets the requirements of Section 506.

F. Paint

Paint exposed steel of each bearing assembly other than stainless steel according to System VI of Section 535. Take care to keep Polytetrafluoroethylene (PTFE) or sliding surfaces free of paint.

G. Design and Applicable Codes

Design, fabricate, and erect pot bearings according to these Specifications and the applicable requirements of the following Standard Codes and Specifications.

- Section 501, including supplements
- Current AASHTO Standard Specifications for Highway Bridges

Additional design parameters with which the pot bearing manufacturer must comply:

1. Bearing on Concrete: Maximum bearing pressure is as indicated in AASHTO.
2. Elastomeric Disc: Design compressive strength is 3,500 psi (25 MPa).
3. Sliding Surfaces: Accommodate translation by sliding of a hard mating surface of stainless steel across a PTFE surface.
 - a. Stainless Steel Sliding Surface: Accurate, flat surface with Brinnell hardness of 125 minimum.
 - 1) Stainless steel sliding surface to completely cover PTFE surface in all operating positions of the bearing.
 - 2) Position the stainless steel sliding surface so that the sliding movement causes the dirt and dust accumulation to fall from the surface of the stainless steel.
 - b. PTFE Sliding Surface: Do not use holes or slots in the PTFE sliding surface.
 - c. Static Coefficient of Friction: Under a load of 3,500 psi (25 MPa), do not exceed 4 percent for unfilled PTFE nor 8 percent of filled PTFE surfaces.
 - d. Rotation: 0.015 radians.

- e. Piston-Cylinder Clearance: Limit clearance to 0.30 in (0.76 mm). Use a brass or stainless steel sealing ring to prevent extrusion of the elastomeric material.

H. Substituted Bearings

Pot bearings with a design similar to that shown on the Plans may be used provided the bearings to be substituted are approved by the State Bridge Engineer and comply with the following:

1. Equal or better load carrying and moment capacity.
2. All control dimensions are maintained and bearings fit within the limits of detailed masonry plate.
3. Use filled or unfilled (recessed) PTFE.
4. Piston-cylinder clearance is limited to 0.030 in. (0.76 mm) and a brass or stainless steel sealing ring shall be used to prevent extrusion of the elastomeric material.
5. Elastomeric material is used as a confined medium within the pot.
6. The elastomeric disc is lubricated by a means acceptable to the Engineer.
7. Do not use aluminum or aluminum alloy.
8. Equal or better than the pot bearings shown on the Plans in all structural respects and meets all design requirements.

581.2.01 Delivery, Storage, and Handling

A. Assembling and Marking

Have each pot bearing assembled at the plant, marked for identification, and delivered to the construction site as a complete unit.

Each bearing shall be marked with permanent match-marks to indicate the normal position of the bearing.

B. Transportation, Storage, and Handling During Construction

Follow these guidelines to transport, store, and handle pot bearings during construction:

1. Protect each pot bearing from dust and moisture.
2. Store the PTFE surface in the shade to avoid the damaging effects of ultraviolet rays.
3. Protect the pot bearings from damage during construction and prevent contamination of the various components of the pot bearings.

Ensure that the Fabricator also follows the above requirements.

During transportation and storage, cover the bearings with moisture-proof and dust-proof covers.

581.3 Construction Requirements

581.3.01 Personnel

A. Skilled Representative

Have the bearing manufacturer provide a skilled representative who is certified by the manufacturer to be experienced in similar installations.

The representative shall:

- Give aid and instruction during the pot bearing installation.
- Be present during the initial bearing installation.
- Be present during welding of the pots to the masonry plates, if not performed in the manufacturer's shop.
- Remain on the job until the bearing installation proceeds without trouble and until the workmen are experienced with the work for each installation as determined by the Engineer.

Arrange to have the manufacturer's skilled representative present whenever requested by the Engineer.

581.3.02 Equipment

General Provisions 101 through 150.

581.3.03 Preparation

General Provisions 101 through 150.

581.3.04 Fabrication

A. Polytetrafluoroethylene (PTFE)

Ensure that the PTFE, including its connection to its backup material, conforms with the requirements of Section 887, except as modified in this Specification.

Have the PTFE sliding surface bonded under factory controlled conditions, or mechanically connect it to a rigid backup material that can resist bending stresses of the sliding surfaces.

As an alternate, PTFE material of twice the thickness specified above may be recessed for half its thickness in the backup material. Ensure that it is at least 1/8 in (3 mm) thick.

1. When shown on the Plans, weld the pot to the masonry plate before installing the elastomer.
If welding procedures established and approved by the Engineer restrict the temperature of the bond area to no greater than 300 °F (150 °C), welding to steel plates with a bonded PTFE surface is permitted.
Use temperature-indicating wax pencils or other suitable means to determine the temperature.
2. After fabricating the backup material, plane it before bonding the stainless steel or PTFE to a true plane surface.
3. Have the PTFE sheets bonded at the bearing manufacturer's factory under controlled conditions according to the approved adhesive system manufacturer's written instructions.
4. When epoxy bonding PTFE sheets, ensure that the side of the PTFE sheet to be bonded to the metal is factory treated by the sodium naphthalene or sodium ammonia process.
5. After the bonding operation, ensure that the PTFE surface is smooth, flat, and bubble free. Polish the filled PTFE surfaces.
6. Positively locate the elements of the bearing in the bearing manufacturing and assembling.
7. If using bearing other than those detailed on the Plans, obtain approval before constructing the substructure upon which the bearings will be installed.
8. Have each bearing assembled at the manufacturer's plant, marked for identification, and delivered to the construction site as a complete unit.

Ensure that the bearings have permanent match-marks to indicate the normal position of the bearing.

581.3.05 Construction

A. Erection

Place bearings at their proper locations before erecting the superstructure supported by the bearings.

1. Install Pier Tops
Install pier tops horizontal at the correct elevation with a plus or minus tolerance of zero. Do not install the masonry plates until the Engineer accepts the pier tops.
2. Install the Anchor Bolts
Cast anchor bolts in the concrete or set them in preformed holes, unless otherwise shown on the Plans. If setting them in preformed holes, fill the preformed holes in the concrete substructure with epoxy grout.
 - a. Insert the anchor bolts to the prescribed depth.
 - b. Place additional grout as required in the annular space around the anchor bolts until the grout is well packed and flush with the top surface of the concrete.

- c. Wipe clean the exposed surfaces of the anchor bolts and substructure. Do not allow a load on grout that has not been in place at least 7 days.
3. Install Masonry Plates
Set the masonry plates to the proper elevation on the previously finished concrete pads.
4. Install the Bearings
 - a. Place the bearing at the predetermined locations when erecting the superstructure.
 - b. Remove the temporary restraints as directed by the bearing manufacturer.
 - c. Adjust the bearings as follows:
 - Adjust the expansion bearings from the normal position at 60 °F (15 °C) to allow for the ambient temperature during erection or casting.
 - Adjust the pot bearings to allow them to move when dead loads are applied. Ensure that the bearing is properly positioned and parallel (free from rotation) after applying the dead load.
 - Adjust the bearings horizontally on the masonry plate to properly fit the superstructure members being erected.
 - d. After adjustments and approval by the Engineer, weld the bearings to the masonry plate.

581.3.06 Quality Acceptance

Instruct the manufacturer to furnish facilities to test and inspect the completed bearings in the plant or at an independent test facility. An approved testing laboratory or the manufacturer supervised by an approved independent expert shall perform the testing.

Follow these testing guidelines:

- Instruct the manufacturer to allow the Engineer and Inspectors access to the plant and test facilities.
- Furnish certified test reports, materials certificates, and a certificate of compliance to conform with the requirements in the Specifications.
- Perform testing according to Section 887 and this Specification. The Department reserves the right to sample and test the material and pot bearing assemblies as shown in Section 106.
- Test complete bearing assemblies or a specially manufactured pot bearing prototype that has a capacity of 400 kips (181 000 kg).

Successfully tested full-size bearings that meet the requirements of this subsection and have no damaged components, finishes, or surfaces may be used in construction. Provide prototype pot bearings, if used, at no additional expense to the Department.

Specific Items tested are as follows:

A. Coefficient of Friction

Perform tests to determine the static coefficient of friction of the first movement under a load of 3,500 psi (25 MPa) on a piston area applied continuously for 12 hours before testing. Determine under a load of 2,000 psi (14 MPa) on a piston area the following:

1. The static coefficient of friction value shall not exceed 10 percent for filled PTFE surfaces and 6 percent for unfilled PTFE surfaces.
2. The first movement static and dynamic coefficient of friction at a sliding speed of less than 1 in per min (0.4 mm per sec). Values shall not exceed 10 percent for filled PTFE surfaces and 6 percent for unfilled PTFE surfaces.
3. The static and dynamic coefficient of friction is determined after the bearing is subjected to 100 design movements at a speed of less than 1 ft per min (5 mm per sec). Values shall not exceed those indicated in step 2 above. Signs of bond failure or other defects are cause for pot bearing rejection.

B. Proof Loading

Perform, under maximum design loads, proof loading and compression deflection tests on a full-size pot bearing.

C. Cold Flow

Subject an approved sample of filled PTFE or unfilled PTFE to a static pressure of 3,500 psi (25 MPa) for at least 24 hours. Ensure that the PTFE material is bonded or mechanically connected to its backup material in the same way as the pot bearing.

Apparent cold flow of the PTFE material is cause for pot bearing rejection.

581.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

581.4 Measurement

Pot bearing assemblies are measured by Lump Sum for each bridge. Determine the actual quantities required before submitting the bid.

581.4.01 Limits

General Provisions 101 through 150.

581.5 Payment

The work in this Specification will be paid for on a Lump Sum basis.

Payment is full compensation for:

- Furnishing materials and equipment including structural steel components of the bearings, masonry plates, top plates, sole plates, PTFE, elastomers, anchor bolts, and welding
- Designing the pot bearing
- Performing tests
- Furnishing prototype bearings and test samples
- Performing Work as described and specified in this Specification or the Plans
- Providing incidentals to complete the work

Payment will be made under:

Item No. 581	Pot bearings, bridge No. ____	Per lump sum
--------------	-------------------------------	--------------

581.5.01 Adjustments

General Provisions 101 through 150.

Section 582—Rock Dowels

582.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 590—Fiber Reinforced Polymer (FPR) Composite Material

590.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 600—Controlled Low Strength Flowable Fill

600.1 General Description

This work consists of furnishing and placing ready-mixed or volumetric mixed Flowable Fill as an alternate to compacted soil as approved by the Engineer. Applications for this material include beddings, encasements, and closures for tanks and pipe, and general backfill for trenches and abutments.

600.3.02 Equipment

General Provisions 101 through 150.

600.3.03 Preparation

Mix Design

Flowable fill can be batched by ready-mix or volumetrically mixed on site.

Ready-mixed flowable fill is a mixture of Portland cement, fly ash, fine aggregate, air entraining admixture, and water. Ready-mixed flowable fill contains a low cement content for reduced strength development.

Volumetric mixed flowable fill is a mixture of Class C fly ash or Portland cement, Class F fly ash, and water mixed on site.

1. Submit mix designs for flowable fill to the Engineer for approval by the Office of Materials. The following table lists mix design proportion ranges for excavatable and non-excavatable flowable fill:

*Table 1—Mix Designs for Flowable Fill				
	Ready-Mixed		Volumetric Mixed	
	Excavatable	Non-Excavatable	Excavatable	Non-Excavatable
Cement, Type I	75-100 lbs/yd ³ (45-60 kg/m ³)	75-150 lbs/yd ³ (45-90 kg/m ³)	90 lbs/yd ³ (53 kg/m ³)	150 lbs/yd ³ (90 kg/m ³)
Class C Fly Ash	-	-	735-840 lbs/yd ³ (333-381 kg/m ³)	841-1045 lbs/yd ³ (381-474 kg/m ³)
Class F Fly Ash	-	150-600 lbs/yd ³ (90-355 kg/m ³)	1250-2000 lbs/yd ³ (567-1186 kg/m ³)	1045-1940 lbs/yd ³ (474-1150 kg/m ³)
Water	**	**	**	**
***Air	15 to 35%	5-15%	NA	NA
***28-Day Compressive Strength	Maximum 100 psi (690 kPa)	Minimum 125 psi (860 kPa)	Maximum 100 psi (690 kPa)	Minimum 125 psi (860 kPa)
***Unit Weight (Wet)	90-100 lbs/ft ³ (1440-1600 kg/m ³)	100-125 lbs/ft ³ (1600-2000 kg/m ³)	90-100 lbs/ft ³ (1440-1600 kg/m ³)	100-125 lbs/ft ³ (1600-2000 kg/m ³)

***Amounts singly or in combination to make the mix yield one cubic yard (meter).**

****Mix designs shall produce a consistency that will result in a flowable self-leveling product at time of placement.**

*****The requirements for percent air, compressive strength, and unit weight are for laboratory designs only and are not intended for jobsite acceptance requirements.**

600.3.04 Fabrication

Ready-Mixed

Ensure ready-mixed flowable fill is manufactured at plants that qualify as approved sources according to the Standard Operating Procedure for Quality Assurance for Ready-Mix Concrete Plants in Georgia (SOP-10). Mix and deliver according to Subsection 500.2.01 of the Specifications or other methods approved by the Engineer. Revolution counter requirements are waived.

Volumetric Mixed

Ensure volumetric mixed flowable fill is manufactured through the use of volumetric mixers according to Subsection 500.3.02 of the Specifications or other methods approved by the Engineer.

600.3.05 Construction

When using as backfill for pipe, where flotation or misalignment may occur, assure correct alignment of the pipe by using straps, soil anchors, or other approved means of restraint.

Protect flowable fill from freezing for 36 hours after placement.

600.3.06 Quality Acceptance

Jobsite Acceptance

Acceptance of flowable fill is based on documentation as outlined in Subsection 500.1.03 of the Specifications and a minimum temperature of flowable fill at the point of delivery of 50 °F (10 °C).

600.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

600.4 Measurement

Flowable fill will be measured for payment in cubic yards (meters) in place and accepted when shown as a pay item in the Contract. When flowable fill is not shown as a pay item, include the cost of the work in the bid price for the appropriate item.

600.4.01 Limits

General Provisions 101 through 150.

600.5 Payment

When shown as a pay item in the Contract, flowable fill complete, in place and accepted will be paid for per cubic yard (meter).

Payment will be made under:

Item No. 600	Flowable fill	Per cubic yard (meter)
--------------	---------------	------------------------

600.5.01 Adjustments

General Provisions 101 through 150.

Section 601—Criblock Retaining Wall

601.1 General Description

Specifications for this work will be included elsewhere in the Contract.

Section 603—Rip Rap

603.1 General Description

This work includes placing protective coverings of sand-cement bag rip rap or stone rip rap.

When required, this work includes placing crushed stone filter material or plastic filter fabric beneath stone rip rap on:

- Fill slopes
- Cut slopes
- End rolls
- Shoulders
- Ditches
- Stream banks
- Channel banks
- Other locations

603.2 Materials

Ensure that the materials meet the requirements of the following Specifications:

Material	Specification
Portland cement	830.2.01
Rip Rap (Stone)	805.2.01
Membrane Curing Compound	832.2.03

Material	Specification
Stone Filter Blanket	815.2.01 or 800.2.01_(Size No. 467*)
Fine Aggregate for Sand Cement Rip Rap	801.2.03
Water	880.2.01
Woven Plastic Filter Fabric	881.2.05
*Except that up to 10% is allowed to pass the No. 4 (4.75 mm) sieve.	

A. Bags for Sand-Cement Bag Rip Rap

Use cotton, burlap, or fiber reinforced paper bags that can contain the sand-cement mixture without leaking during handling and placing. Do not use bags that previously held sugar or other material that will adversely affect the sand-cement mixture.

Ensure that the capacity is at least 0.75 ft³ (0.02 m³) but not greater than 2 ft³ (0.5 m³).

B. Stone Dumped Rip Rap

Stone dumped rip rap is designated on the Plans as Type 1 or Type 3 as defined in Subsection 805.2.01.

603.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

603.3 Construction Requirements

603.3.01 Personnel

General Provisions 101 through 150.

603.3.02 Equipment

General Provisions 101 through 150.

603.3.03 Preparation

General Provisions 101 through 150.

603.3.04 Fabrication

General Provisions 101 through 150.

603.3.05 Construction

Construct this Work according to the following requirements:

A. Preparing the Foundations

Prepare the ground surface where the rip rap will be placed to conform with the correct lines and grades before beginning the placement.

1. When filling depressions, compact the new material with hand or mechanical tampers.
Dispose of excess material by spreading it neatly within the right-of-way as an incidental part of the work.
2. Unless otherwise shown or provided below, begin placing the rip rap in a toe ditch constructed in original ground around the toe of the fill or the cut slope.
Ensure that the toe ditch is 2 ft (600 mm) deep in original ground and the side next to the fill or cut has the same slope.

3. After placing the rip rap, backfill the toe ditch and spread the excess dirt neatly within the right-of-way as an incidental part of the work.
4. When beginning rip rap in water or below normal water level, substitute an apron of rip rap for the toe ditch. Ensure that the width and thickness of this apron is as shown on the Plans or determined by the Engineer.

B. Placing Stone Rip Rap

Place rip rap to the limits shown on the Plans or as directed by the Engineer. Place and classify rip rap as follows:

1. Stone Plain Rip Rap

Dump and handle stone plain rip rap into place to form a compact layer to the design thickness.

Ensure that the thickness tolerance for the course is plus 12 in (300 mm) with no under-tolerance. If the Plans do not show a thickness, place stone rip rap to at least 12 in (300 mm) thick, but no greater than 2 ft (600 mm) thick.

2. Stone Dumped Rip Rap

Dump stone dumped rip rap into place to form a uniform surface as thick as specified in the Plans.

a. Ensure that the thickness tolerance for the course is minus 6 in (150 mm) and plus 12 in (300 mm). If the Plans or Proposal do not specify a thickness, place the course to at least 2 ft (600 mm) thick.

b. Recycled concrete that meets the requirements of Subsection 805.2.01 may be used instead of stone when shown on the Plans or approved by the Engineer.

Use recycled concrete only when materials do not contain steel after processing.

NOTE: Do not use recycled concrete in aesthetically sensitive areas.

3. Stone Grouted Rip Rap

Place stone grouted rip rap according to specifications for stone plain rip rap and these guidelines:

a. Prevent earth from filling the spaces between the stones.

b. After placing the stone, fill the spaces between them with 1:3 grout composed of Portland cement and sand mixed thoroughly with enough water to make a thick, creamy consistency.

c. Place the grout beginning at the toe. Finish it by sweeping with a stiff bristle broom.

d. After grouting, cover the rip rap and keep it wet for 5 days, or cover and keep wet for 24 hours and then coat with white pigmented membrane curing compound.

C. Placing Filter

Place woven plastic filter fabric under all rip rap. Follow these requirements for placing the filter fabric:

1. Prepare the surface to receive the fabric until it is smooth and free from obstructions, depressions, and debris.

2. Place the fabric with the long dimension running up the slope. Minimize the number of overlaps.

3. Place the strips to provide a width of at least 1 ft (300 mm) of overlap for each joint.

4. Anchor the filter fabric in place with securing pins of the type recommended by the fabric manufacturer. Place the pins on or within 3 in (75 mm) of the centerline of the overlap.

5. Place the fabric so that the upstream strip will overlap the downstream strip.

6. Loosely place the fabric to prevent stretching and tearing during stone placement.

Do not drop the stones more than 3 ft (1 m) during construction.

7. Always protect the fabric during construction from clogging due to clay, silts, chemicals, or other contaminants.

8. Remove contaminated fabric or fabric damaged during installation or rip rap placement. Replace with uncontaminated or undamaged fabric at no expense to the Department.

D. Placing Sand-Cement Bag Rip Rap

Place rip rap to the limits shown on the Plans or as directed by the Engineer.

1. Proportioning Materials

Mix sand and Portland cement at the maximum ratio of 5:1 by weight.

- a. Obtain a minimum compressive strength of 500 psi (3 MPa) in 7 days.
- b. For sand-cement bag rip rap, use enough water to make up the optimum moisture content of the aggregate and cement as determined by AASHTO T 134.
- c. When sand-cement rip rap is to be prebagged, mix the sand cement dry. After placing each course, wet the bags until the bags are wet enough for proper cement hydration.

2. Placement

Before placing sand-cement bag rip rap, fill the bags full, but allow room to tie the bags.

- a. Place the bagged rip rap by hand with the tied ends facing the same direction. Produce close, broken joints.
- b. Place header courses when directed by the Engineer or required by the Plans.
- c. After placing the bags, ram or pack them against one another to produce the required thickness and form a consolidated mass.
- d. Do not allow the top of each bag to vary more than 3 in (75 mm) above or below the required plane.

E. Placing Stone Blanket Protection

Ensure that the stone blanket protection meets the materials Specifications for stone filter blanket as specified in Subsection 603.2, "Materials," except stone size No. 357 will be allowed instead of size No. 467.

Place stone blanket protection to the limits shown on the Plans, or as directed by the Engineer.

Uniformly place this material to the thickness shown on the Plans and to a thickness tolerance of 0.5 in (± 15 mm).

Do not use stone blanket protection on slopes steeper than two horizontal to one vertical or in areas highly susceptible to erosion. Do not use plastic filter fabrics with stone blanket protection.

603.3.06 Quality Acceptance

General Provisions 101 through 150.

603.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

603.4 Measurement

This work is measured for payment in square yards (meters) of accepted material of the specified thickness. Area measurements are made parallel to the surface on which the material is placed. Plastic filter fabric will be measured as the area of rip rap placed and accepted. No separate measurement will be made for fabric overlap joints, seams, or vertical sections at toe of slopes. No separate measurement is made for grout or cushioning sand.

Plan dimensions are figured by the use of filled bags 12 by 18 by 6 in. (300 by 450 by 150 mm) thick.

When filled bags are less than Plan dimensions or are of varying lengths or width, Plan square yards (meters) will be used to determine pay quantities, if overall dimensions are equal to or greater than those shown on the Plans.

603.4.01 Limits

General Provisions 101 through 150.

603.5 Payment

This work will be paid for at the Contract Price per square yard (meter) of material complete in place.

Payment will be made under:

Item No. 603	Stone plain rip rap ___ in (mm) thick	Per square yard (meter)
Item No. 603	Stone dumped rip rap (<u>type</u>) ___ in (mm) thick	Per square yard (meter)

Item No. 603	Stone grouted rip rap (<u>thick</u>)	Per square yard (meter)
Item No. 603	Filter blanket	Per square yard (meter)
Item No. 603	Sand-cement bag rip rap, ____ in (mm) thick	Per square yard (meter)
Item No. 603	Stone blanket protection, ____ in (mm)	Per square yard (meter)
Item No. 603	Plastic filter fabric	Per square yard (meter)

603.5.01 Adjustments

General Provisions 101 through 150.

Section 607—Rubble Masonry

607.1 General Description

This work includes constructing rubble masonry from classes such as coursed, random, and random range work, from roughly squared and dressed stone laid with or without mortar as specified on the Plans.

607.1.01 Definitions

General Provisions 101 through 150.

607.1.02 Related References**A. Standard Specifications**

Section 834—Masonry Materials

B. Referenced Documents

General Provisions 101 through 150.

607.1.03 Submittals

General Provisions 101 through 150.

607.2 Materials

Ensure that materials meet the requirements of the following specifications:

Material	Section
Stone for Masonry	834
Mortar and Grout	834

607.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

607.3 Construction Requirements**607.3.01 Personnel**

General Provisions 101 through 150.

607.3.02 Equipment

General Provisions 101 through 150.

607.3.03 Preparation

General Provisions 101 through 150.

607.3.04 Fabrication

General Provisions 101 through 150.

607.3.05 Construction

Construct rubble masonry as follows:

A. Shaping the Stone

Roughly square the stones on joints, beds, and faces. At angles and ends of walls, use selected stone roughly squared and pitched to line. If specified, finish the corners or angles in exterior surfaces with a chisel draft.

Before laying the stone in the wall, shape and dress it so that it will not loosen after it is placed. No dressing or hammering which will loosen the stone will be permitted after it is placed.

B. Laying the Stone

1. Decrease the stone thickness from the bottom to the top of wall.
2. Ensure that the headers in the heart of the wall are the same size as shown in the face and extend at least 12 in (300 mm) into the core or backing.
3. Ensure that headers in walls 2 ft (600 mm) or less in thickness extend entirely through the wall. The headers shall occupy at least 20 percent of the face of the wall.
4. Lay the masonry to line and in roughly leveled courses. Ensure that the bottom of the foundation is large, selected stones.
5. Lay the courses with leaning beds parallel to the natural bed of the material.
6. Regularly diminish the thicknesses of the courses, if varied, from the bottom to the top of the wall. Keep a surplus supply of stones at the site to select from.
7. When mortar masonry is specified:
 - a. Clean each stone and saturate it with water before setting it. Clean and moisten the bed that will receive it.
 - b. Bed the stones in freshly made mortar with full joints. Carefully settle the stones in place before the mortar sets.
 - c. Do not permit spalls in the beds. Ensure that the joints and beds have an average thickness of not more than 1 in. (25 mm).
 - d. Ensure that the vertical joints in each course break with the adjoining courses at least 6 in. (150 mm).
 - e. Do not place vertical joints directly above or below a header joint.

If a stone is moved or if the joint is broken after the mortar has set, take the stone up and thoroughly clean the mortar from the bed and joints. Reset the stone in fresh mortar.

Do not lay the masonry in freezing weather or when the stone contains frost, except by permission and subject to required conditions.

<p>NOTE: Do not lay the masonry in freezing weather or when the stone contains frost, except with permission.</p>
--

- f. Whenever possible, properly point the face joints before the mortar sets. If joints cannot be pointed, rake them out to a depth of 1 in (25 mm) before the mortar sets.
Do not smear the stone face surfaces with the mortar forced out of the joints or the mortar used in pointing.
- g. Thoroughly wet the joints pointed after the stone is laid with clean water and fill with mortar.
- h. Drive the mortar into the joints and finish with an approved pointing tool.
- i. Keep the wall wet while pointing. In hot or dry weather, protect the pointed masonry from the sun and keep it wet for at least three days after the pointing is finished.

NOTE: Do not perform pointing in freezing weather or when the stone contains frost.

- j. After the pointing is completed and the mortar is set, thoroughly clean the walls and leave them in a neat condition.

8. Dry Rubble Masonry

When laying dry rubble:

- a. Take care that each stone takes a firm bearing no less than in three separate points upon the underlying course.
- b. Ensure that face joints are no greater than 1 in (25 mm) wide.
- c. Chink the open front and rear joints with spalls fitted to take firm bearing upon the top and bottom surfaces throughout the length of the stone.
- d. Fill the interstices in the heart of the wall with spalls. When specified, thoroughly slush the open joint on the rear surfaces with mortar to prevent water from seeping through the joints.

C. Weep Holes

Provide adequate drainage for retaining walls with weep holes as shown on the Plans or required by the Engineer.

When backfilling at weep holes, build chimneys and french drains extending through the parts of the fill to be drained. The cost of chimneys, weep holes, and french drains is included in the Contract Price for rubble masonry.

D. Copings

Use copings, bridge seats, and back walls made from the materials shown on the Plans. If not otherwise specified, they shall be Class A concrete.

Make concrete copings in sections at least 12 in (300 mm) thick and from 5 to 10 ft (1.5 to 3 m) long, extending the full width of the wall. Cast the sections in place or precast and set them in place in free mortar beds.

607.3.06 Quality Acceptance

General Provisions 101 through 150.

607.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

607.4 Measurement

This work is measured in cubic yards (meters) of accepted masonry. The dimensions shown on the Plans shall be used except for changes made by the Engineer.

Excavation for rubble masonry is not measured for separate payment.

607.4.01 Limits

General Provisions 101 through 150.

607.5 Payment

This work will be paid for at the Contract Price per cubic yard (meter) for mortar rubble masonry or dry rubble masonry complete in place.

Payment will be made under:

Item No. 607	Mortar rubble masonry	Per cubic yard (meter)
Item No. 607	Dry rubble masonry	Per cubic yard (meter)

607.5.01 Adjustments

General Provisions 101 through 150.

Section 608—Brick Masonry

608.1 General Description

This work includes laying brick in mortar.

608.1.01 Definitions

General Provisions 101 through 150.

608.1.02 Related References

A. Standard Specifications

Section 207—Excavation and Backfill for Minor Structures

Section 834—Masonry Materials

B. Referenced Documents

General Provisions 101 through 150.

608.1.03 Submittals

General Provisions 101 through 150.

608.2 Materials

Ensure that the materials meet the requirements of the following Specifications:

Brick for Masonry	834
Mortar and Grout	834

608.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

608.3 Construction Requirements

608.3.01 Personnel

General Provisions 101 through 150.

608.3.02 Equipment

General Provisions 101 through 150.

608.3.03 Preparation

General Provisions 101 through 150.

608.3.04 Fabrication

General Provisions 101 through 150.

608.3.05 Construction

A. Brick Selection

Select brick for exposed surfaces, corners, etc. from brick approved as to color and uniformity.

B. Laying Brick

Follow these guidelines when laying brick:

1. Saturate the brick with water before laying it.
2. Lay the brick using the shove-joint method to bond it thoroughly into the mortar.
3. Arrange headers and stretchers to bond the mass thoroughly.
4. For straight masonry walls using stretcher courses, ensure that at least 1 course in 7 is a header course.
5. Finish joints properly as the Work progresses. Create joints at least 0.25 in (5 mm) but no more than 0.5 in (15 mm) thick.

NOTE: Do not use spalls or bats except to shape around irregular openings or to use at corners.

6. Lay brick evenly and neatly.

C. Observing Weather Limitations

Do not lay brick in freezing weather or when the bricks contain frost, except with permission from the Engineer and when required.

In hot and dry weather, protect the masonry and keep it wet for at least 48 hours after laying the brick.

D. Backfilling

Do not place backfill against the masonry until it is at least 7 days old. During cold weather, the restricted period may be longer as directed.

608.3.06 Quality Acceptance

All brick masonry shall present an even, uniform, neat, and workmanlike appearance.

608.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

608.4 Measurement

This work is measured for payment by one of the two methods specified below. The unit of measurement is stated in the Contract. Separate payment is not made for brick masonry used in catch basins, inlets, manholes, and similar items, which are measured and paid for per each.

Excavation and backfill for this work is not measured for payment except as specified in Section 207. Mortar is not paid for separately, and the cost is included in the Contract Price for brick masonry.

A. Measurement by Cubic Meter

When brick masonry is measured by the cubic yard (meter), the volume measured is the brick and mortar placed within the lines indicated on the Plans and typical cross sections or as directed by the Engineer.

B. Measurement by Number of Bricks

When brick masonry is measured by the brick, the unit of measurement is each thousand (M) bricks and fraction placed within the lines indicated on the Plans and typical cross sections or as directed by the Engineer.

608.4.01 Limits

General Provisions 101 through 150.

608.5 Payment

This work will be paid for at the Contract Price per cubic yard (meter) or per thousand (M) bricks for brick masonry complete in place.

Payment will be made under:

Item No. 608	Brick masonry	Per cubic yard (meter)
Item No. 608	Brick masonry	Per thousand (M)

608.5.01 Adjustments

General Provisions 101 through 150.

Section 609—Removal of Portland Cement Concrete Roadway Slabs

609.1 General Description

This work includes removing the full depth of existing jointed Portland cement concrete pavement slabs of various lengths. The slabs to be removed are shown on the Plans or are designated by the Engineer.

609.1.01 Definitions

General Provisions 101 through 150.

609.1.02 Related References

General Provisions 101 through 150.

609.3.02 Equipment

General Provisions 101 through 150.

609.3.03 Preparation

General Provisions 101 through 150.

609.3.04 Fabrication

General Provisions 101 through 150.

609.3.05 Construction

The Engineer will determine which slabs to remove and replace and whether to use full or partial slab replacement.

Section 609-Removal of Portland Cement Concrete Roadway Slabs

A. Partial Slab Replacements

The Engineer will determine the limits of removal. Remove and replace at least 6 ft (1.8 m) of slab measured longitudinally and 12 ft (3.6 m) measured transversely.

Any slab removal beyond the limits determined by the Engineer will be at no additional cost to the Department for removal and replacement.

1. Saw the slab full depth longitudinally along the center-line joint and shoulder joint and transversely along the area marked for removal, including transverse joints where applicable.
 - a. If approved by the Engineer, omit the shoulder joint cut if doing so does not damage the shoulder.
 - b. If necessary and if approved by the Engineer, make additional cuts within the removal area to remove the damaged slab more easily.
2. Thoroughly remove saw slurry and other contaminants from the over-cutting beyond limits of the removal area. Repair by filling the overcuts with Type II epoxy adhesive that meets the requirements of Section 886. Clean and fill the overcuts as soon as possible, but no later than when the joints are sealed.
3. Remove the damaged slabs by lifting. Do not fragment the slabs for removal unless approved by the Engineer.
4. Drill holes in each slab section to accommodate the expanding type lift anchors. Remove sections nearest the centerline joint first to minimize damage to the shoulder.

NOTE: During removal, avoid damaging the pavement base, shoulder, or sides that will not be removed.

5. Repair the damaged shoulder area to the Engineer's satisfaction at the Contractor's expense.
6. If the adjacent concrete pavement is damaged during removal, enlarge the removal area to include the damaged sections of adjacent concrete.

All applicable rules regarding the minimum size of remaining slab will apply as shown on the Plans.
Remove and replace additional slab lengths damaged from removing the initial slab at the Contractor's expense.
7. Remove loose underlying base material to produce a sound, well-compacted base.
8. Thoroughly tamp the material loosened in the removal process to the Engineer's satisfaction before replacing the slab.
9. Dispose of the slabs and underlying base material removed during this work.
10. Obtain the disposal site and necessary permits and agreements.

609.3.06 Quality Acceptance

General Provisions 101 through 150.

609.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

609.4 Measurement

Slabs and portions of slabs removed are measured by the square yard (meter) using the average squared dimensions. Removing underlying base material and cleaning and repairing overcuts is not measured for payment.

609.4.01 Limits

General Provisions 101 through 150.

609.5 Payment

Slabs and portions of slabs, measured as specified in Subsection 609.4, "Measurement" above, will be paid for at the Contract Unit Price bid. Payment is full compensation for sawing, cleaning, repairing over-cutting, and removing and disposing of the concrete and any underlying base material.

Payment will be made under:

Section 609-Removal of Portland Cement Concrete Roadway Slabs

Item No. 609	Remove roadway slab	Per square yard (meter)
--------------	---------------------	-------------------------

609.5.01 Adjustments

General Provisions 101 through 150.

Section 610—Removal of Miscellaneous Roadway Items

610.1 General Description

This work includes removing, salvaging, or disposing of items listed in the Proposal as Pay Items to be removed, and backfilling the excavations made during removal.

Remove structures not separately listed as Pay Items in the Contract as specified in Sections 201, 202, or 205.

610.1.01 Definitions

General Provisions 101 through 150.

610.1.03 Submittals

General Provisions 101 through 150.

610.2 Materials

610.2.01 Delivery, Storage, and Handling

A. Materials Retained by the Department

Unless removed under Sections 201, 202, or 205, or unless otherwise provided for in the Plans or Proposal, carefully remove materials with a salvage value.

1. Neatly stack or stockpile the materials along the right-of-way near the removal point and above high water.
2. Store highway signs standing on edge and protected from the elements.
3. Replace materials damaged, defaced, or destroyed by removing them carelessly at no cost to the Department.
4. Notify the Engineer when the materials have been stockpiled and are ready to be transported.
5. Keep materials secure and replace (at the Contractor's expense) materials lost, stolen, or missing within a maximum of 10 days after the Engineer has been notified that the materials are ready to be transported.

B. Materials Reused in the Work

Maintain structures, portions of structures, and other materials to be salvaged and reused in reconstruction work.

Assume responsibility for the material until Project Final Acceptance.

Repair or replace materials lost or stolen before reuse at the Contractor's expense.

Spread suitable surplus excavation material on the slopes of the roadway embankments. Otherwise, dispose of the waste materials off the right-of-way at the Contractor's expense.

C. Bridge Components

Dispose of bridge components according to Section 540. Replace or repair at the Contractor's expense structures, portions of structures, or materials to be salvaged, retained, or used in the reconstructed work but that were carelessly damaged or destroyed by the Contractor.

610.3 Construction Requirements

610.3.01 Personnel

General Provisions 101 through 150.

610.3.02 Equipment

General Provisions 101 through 150.

610.3.03 Preparation

If removing a structure may endanger a new construction, finish that part of the work before beginning the new construction.

610.3.04 Fabrication

General Provisions 101 through 150.

610.3.05 Construction

A. Protection of Remaining Structures

Do not use explosives, equipment, or devices that may endanger structures, facilities, or other property to remain in place. If parts of structures are to remain in place, protect them from damage during construction. Protect and preserve the salvage value of materials to be salvaged.

B. Extent of Removal

Separate and remove existing structures, with their attached parts and connections, as shown on the Plans or designated to be removed.

1. When a part of an existing structure is to remain in place, ensure that the part to be removed extends to a construction joint or is cut off to the lines shown on the Plans, leaving reasonably smooth faces.
Remove walls and other masonry construction to the bottoms of the foundations unless otherwise specified.
2. Remove walls and their foundations within the roadbed area to an elevation at least 3 ft (900 mm) below the top of the finished subgrade, unless otherwise specified.
3. See Subsection 201.3.05.C.1.c, "Abandoned Obstructions," for guidelines for rigid surfaces.

C. Railway Tracks

Removing railway tracks includes removing rails, ties, switches, towers, concrete structures, sign posts, and other related railway structures. Leave ballast in place, unless otherwise specified.

D. Inlets, Catch Basins, Manholes, and Culverts

1. Remove gratings, traps, and other metal castings of inlets, catch basins, and manholes without damaging them. Reuse them on new structures or salvage them, whichever the Engineer directs.
2. Remove old culverts down to the ground level or to the adjacent water level, unless otherwise shown on Plans.
3. Remove the bottom slabs of inlets, catch basins, manholes, and culverts. If the Engineer permits them to remain in place, break them up so that water will readily pass through them.

E. Removing Pipe

Uncover the pipe to remove it without damage. Exercise care in removing the pipe. Replace pipe sections damaged by negligence at the Contractor's expense.

After removing the pipe, clean it and neatly stack it at points directed by the Engineer along the line of the work. Unless otherwise specified, the pipe is the property of the Department.

F. Septic Tanks

When encountering septic tanks, completely remove the contents of each tank.

1. Remove and dispose of the tank's contents as required by the State Department of Health and local health authorities.
2. Before backfilling the remaining portion of the septic tank, drill holes in the bottom of the tank or break it up as the Engineer directs, to permit drainage.

G. Backfilling

Backfill trenches and other excavations dug for removing miscellaneous structures.

1. Use approved materials in the backfill.
2. Compact the backfill in layers no more than 6 in (150 mm) thick and with the proper moisture content. Use pneumatic tampers or other approved equipment.
3. Under the roadway, ensure that the degree of compaction conforms to Section 208.
Elsewhere, compact the backfill equal to the soil surrounding it.

H. Structures to Remain

Preserve unharmed the miscellaneous structures, including fences, buildings, pipe lines, pole lines, water and sewer lines, and other improvements that owners or the Department will retain or that others will remove.

I. Culverts to be Extended

Where concrete culverts are to be extended, remove a minimum amount of concrete in parapets, wing walls, and wing wall footings to clear the new construction. Make the joint or connection as shown on the Plans or as directed by the Engineer.

J. Fences

When removing fences, do not allow livestock to escape. If fences are to be reset according to Section 611, protect the splinter coating of fence fabric, steel fence posts, and braces.

The Engineer will require that reusable posts removed be clean and free of concrete. If desired, furnish new posts instead of cleaning the old ones at no additional cost to the Department.

K. Raised Edge Curb

Remove raised edge curb to a reasonably true line at the elevation of normal finished pavement.

If the average of the plus and minus deviations approximate the original normal edge of pavement, a tolerance of approximately 1 in (25 mm) above or below this elevation will be accepted.

Do not shatter pavement that will be retained.

L. Highway Signs

Remove the entire sign from the supports, and remove the supports from the concrete foundation.

M. Lighting Standards and Appurtenances

Disassemble the lighting standard, and separate each component part including the transformer base. Cut the underground duct before removing these items.

N. Removal of Existing Building Structures

Demolish, remove, and dispose of all building structures within the right of way and easement areas including concrete slabs, footings, foundations, etc. as shown on the plans. Grade all disturbed ground to a reasonably smooth and pleasing appearance, free from loose boulders and other debris that would interfere with the use of power mowers. Grass all disturbed areas.

Prior to demolition or removal:

1. Inspect all building structures for the presence of asbestos. The inspection shall be done by an EPA Asbestos Hazard Emergency Response Act (AHERA) accredited inspector whose certification is current.
2. Provide a copy of all inspection reports including the inspector’s credentials to the Engineer.
3. Provide written notice of intent to demolish to the Georgia Environmental Protection Division (EPD) of the Georgia Department of Natural Resources in accordance with EPD regulations with a copy to the engineer. This notice is required even if there is no asbestos present.

If there is asbestos present, its removal shall be done by a contractor licensed with the EPD in accordance with the Rules of Georgia Department of Natural Resource Environmental Protection Division chapter 391-3-14-04. All asbestos removal and disposal shall be done in accordance with EPD regulations. All asbestos removal shall be considered as Extra Work and payment will be made in accordance with Subsection 109.05.

610.3.06 Quality Acceptance

General Provisions 101 through 150.

610.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

610.4 Measurement

Removing miscellaneous roadway items is measured to determine the Unit or Units of each type specified in the Proposal and on the Plans. Only when listed as a Pay Item in the Contract will a removed item be measured for separate payment.

610.4.01 Limits

General Provisions 101 through 150.

610.5 Payment

Removing miscellaneous roadway items will be paid for at the Contract Unit Price. Payment is full compensation for removing and disposing of the structures according to these Specifications.

Payment will be made under:

Item No. 610	Remove_____	Per unit shown in Proposal
--------------	-------------	----------------------------

610.5.01 Adjustments

General Provisions 101 through 150.

Section 611—Relaying, Reconstructing, or Adjusting to Grade of Miscellaneous Roadway Structures

611.1 General Description

This work includes relaying, reconstructing, resetting, adjusting to grade, capping minor structures, resetting guard rail, or adjusting other miscellaneous roadway structures as specified in the Proposal or on the Plans.

611.1.01 Definitions

General Provisions 101 through 150.

General Provisions 101 through 150.

611.2 Materials

Most materials for the work in this Specification are salvaged from the removal of existing structures. The Engineer will determine the suitability of the salvaged material for use.

Use other materials to complete the structure, such as mortar, sand-cement grout, sand for sand cushion, bituminous filler, brick, and other materials that meet the requirements of the applicable Specifications for such materials for use in new structures of the same character and type.

611.3.04 Fabrication

General Provisions 101 through 150.

611.3.05 Construction

A. Miscellaneous Roadway Items

Follow these procedures to construct miscellaneous roadway items:

1. Remove existing structures to be rebuilt according to Section 610.
2. Clean the material salvaged for use in the rebuilt structure and stockpile it in convenient places. Protect it from damage until it is used.
3. Dispose of the portions of structures not suitable for reuse as provided in Section 610. Replace them with suitable new material.
4. Relay or rebuild the structures according to the Specifications for new structures of the same type.
5. Adjust to the required grade miscellaneous structures specified in the Proposal or on the Plans by raising or lowering the upper portion of the fixture, including sleeve extensions, adjustable manhole rings, gaskets, mastic, mortar, masonry, and other material.
6. Furnish materials such as mortar, sand-cement grout, sand cushion, bituminous filler, brick, castings, and other materials to excavate, trench, prepare earth foundation, backfill, and other work necessary to complete the Item.

B. Capping an Existing Structure

When capping an existing structure requires removing adjacent existing pavement, sidewalk, curb, gutter, or other improvement not otherwise affected by the work, follow these guidelines:

1. Remove the improvements to expose only the portion of the structure to be modified.
2. Replace the removed improvements to the Engineer's satisfaction without additional compensation.
3. Remove enough existing masonry to lower the top elevation to a point not less than the thickness of the cap plus 3 ft (1 m) below subgrade elevation, unless otherwise indicated.
4. Cap the remaining portion of the structure with a fitted reinforced concrete cover constructed to the general details shown on the Plans.

Grates, rings, plates, covers, hoods, or other castings or fittings removed while capping and not re-used become the property of the Department unless otherwise indicated on the Plans.

C. Resetting Guard Rail

When resetting the guard rail is specified in the Proposal:

1. Reset guard rail removed according to Section 610 where the Plan indicates and to the required post spacing.
2. Furnish materials, including additional hardware, offset blocks, and posts.
3. Replace posts that do not conform to the Plans.
4. Follow the applicable provisions of Section 641.

D. Raising Manholes

When raising manholes:

1. Adjustments may be made by using adjustable extension rings that do not require removing the existing manhole frame.
2. Ensure that the extension device locks to the existing frame and permits height and diameter adjustment. The adjustable extension ring to be used shall have the Engineer's prior approval.
3. Choose an extension ring compatible with the existing casting and cover. Ensure that the adjustment range conforms to the finished pavement surface.
 - a. Use an adjustable extension ring made of materials that meet the requirements of Subsection 854.2.01 or are manufactured from ASTM A 36/A 36M steel and approved by the Office of Materials.
 - b. Ensure that the extension ring and cover are machine ground to reduce contact irregularity. Ensure that the grates are rattleproof.

Section 611-Relaying, Reconstructing, or Adjusting to Grade of Misc. Roadway Structures

- c. Obtain the Engineer's approval for the type of adjustable extension ring used.

E. Replacing Fences

Replace fences removed under Section 610 in kind, using the removed materials as far as possible. Unless the Plans provide for new fence at the particular location, include new materials required in the Bid Price for resetting fence.

611.3.06 Quality Acceptance

General Provisions 101 through 150.

611.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

611.4 Measurement

Relaying, reconstructing, or adjusting to grade, capping minor structures, resetting guard rail, or adjusting other miscellaneous roadway structures is measured to determine the unit or units of each type completed and accepted.

Manhole tops to be raised or lowered 2 ft (600 mm) or less are considered "Adjust to Grade."
